The NPS and USFWS have pointed out that the Canadian counterparts and First Nations are preparing to release grizzly bears in the northern part of the NCE. The BC government has noted that their Recovery Plan is being developed jointly with the USFWS even though this US EIS only addresses the Washington effort. If the northern Canadian part of the NCE was the only release point, it would move the core recovery/release area away from the more densely human populated areas of Washington State. It also would be in line with Washington State law as well since no bears would be translocated directly into Washington, and there also would be predictability on how many bears are being moved into the entire NCE which overlaps both countries. We cannot support either Action Alternative without knowing more on the joint planning that is occurring with Canadian counterparts.

In closing, Back Country Horsemen of Washington, with the support of Back Country Horsemen of America, sees no alternative other than the agency must select Alternate A- No Action at this time. The current DEIS lacks any analysis of

action alternatives and their potential impact on ongoing and anticipated public recreational uses in the NCE. Impacts to recreation are potentially substantive and the DEIS fails to meaningfully address and disclose these impacts. As such the DEIS fails to take the necessary hard look as required by NEPA.

Sincerely,

Correspondence: Grizzly bears should not be re-introduced to the areas in Northern Washington State. My opinion comes from a recreation perspective. National Parks and Wilderness areas are getting increasingly used by the public. This has

been especially noticeable in the last 3-4 years. We are avid backpackers and day hikers and have been on many trips in Montana and Wyoming where grizzly bears are present. Each year, there is at least one attack in these areas. Regular intervention by authorities occurs with problem bears getting into populated areas. Why create this sort of problem in Washington State as well?

Don't do it. It will create more problems than any benefit provided.

Correspondence: Thank you for this opportunity to comment on the: Draft Grizzly Bear Restoration Plan / Environmental Impact Statement for the North Cascades Ecosystem
As a member of Back Country Horsemen of Washington, I am very concerned with the ability to continue to recreate in the North Cascades should a small population of heavily protected grizzly bears be mechanically moved into the region that we recreate in. The DEIS does not sufficiently analyze the impact to recreation or present any options for how trails can be maintained open in the presence of protections implemented to reduce human-grizzly interactions. The Pacific Crest National Scenic Trail runs through the core habitat and has permitted distance hikers of around 10,000. When considering the other trail users in and along the North Cascades Ecosystem (NCE) since this is one of the most populated areas around any bear ecosystem, the use likely exceeds a quarter million visits. However, the DEIS indicates that the use is insignificant. It is very significant and will likely result in many human-bear interactions. The Pacific Northwest National Scenic Trail also runs through the NCE as well as other bear ecosystems to the east, including the Cabinet-Yaak (CYE). The CYE has a more established population of bears but still has resulted with challenges to the very existence of the trail due to the limited number of bears in the CYE (20-40). Opposition to the National Scenic Trail in the recovering bear population area as well as the connecting landscapes between ecosystems has also been expressed by USFWS staff, the same agency putting forth the NCE proposal through which the same trail will pass. Without a more detailed analysis of how to retain the carrying capacity of the trails, trailheads, and campgrounds without resulting in long term or permanent closures, there is no way to effectively review this DEIS. Furthermore, the NPS and USFWS have pointed out that the Canadian counterparts and First Nations are preparing to release grizzly bears in the northern part of the NCE. IF that was the only release point, it would move the core recovery/release area north and away from the more densely human populated areas of Washington State. It also would be in line with Washington State law as well since no bears would be translocated directly into Washington, and there also would be predictability on how many bears are being moved into the entire NCE which overlaps both countries. The BC government has noted that their Recovery Plan is being developed jointly with the USFWS even though this US EIS only addresses the Washington effort. As a trail horse rider in the NCE, I ask that the No Action Alternative be selected. The areas we ride in includes the Mt Baker Snoqualmie National Forest, the Okanogan Wenatchee National Forest including the Pasayten Wilderness, and the North Cascades National Park. We have many horse camps along the boundary of the NCE. We cannot support either Action Alternative without more substantive analysis on impacts to recreation as well as knowing more on the joint planning with Canadian counterparts.

Sincerely,

██████████

Correspondence: I fully support griz reintroduction on the US side of the N.Cascades, and any other suitable, adjacent or surrounding habitat that's available. I fully understand the pros and cons, from my time in the Flathead of MT during the mid-late 1980's, and I firmly believe that most of the opposition is based on fears of very low probability events. You will no doubt catch more grief than the MT biologists did 35 years ago (and in some circles, are still catching it), but very few of the horror stories will ever come to pass, and all those will be exaggerated when they hit the evening news. But ultimately, it's the right thing to do for the ecosystem and for future generations. Good luck!

Correspondence: I have lived in the inland northwest for 43 years. During that time, I have hiked and backpacked extensively in the North Cascades Ecosystem, and more importantly, in ecosystems in eastern Washington/Idaho/Montana, and British Columbia, Canada that are home to grizzly bears. My home is located in a rural forested setting miles from the nearest town. While my game cam has not yet recorded a grizzly, it has recorded black bears, mountain lions, and wolves. Years of living and hiking in grizzly habitat has taught me that with appropriate behavior, and precaution I can coexist with apex predators. I fully support reintroduction of grizzly bears in the North Cascades Ecosystem. Reintroduction will help make whole an ecosystem that has suffered from a reduction in wildlife diversity for many decades. To help manage potential

conflicts, I support the alternative that reintroduces grizzly bears, with the added flexibility to deter or relocate grizzly bears if they venture into neighborhoods.

Correspondence: The reintro of the grizzly bear strikes me as driven by wildlife biologists hoping to reshuffle the deck to restore the range to an earlier time. Grizzlies have been absent from the Cascades since the late 1960's and were few in number at that time. I do not see the need to bring these bears back to the range not only due to the proximity to large population centers and the rapid expansion in backcountry recreation but also there's no viable proof the grizzly would have a positive/negative impact on the Cascades ecologically speaking as compared to say the non-native mountain goats formerly in the Olympics.

I support Alternative A "no action". If a grizzly finds its way into the Cascades and reproduces, fine, but to systematically drop them into all parts of the Cascades is not something I can support at this time.

Correspondence: Dear NPS,
Thank you for allowing me to comment.

I encourage the agency to reconsider your approach to grizzly recovery in the North Cascades. In particular:

1) I support the restoration of grizzlies to the North Cascades, and that the restoration must be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is good for bears and Wilderness.

2) Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

3) I oppose the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection.

4) Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-

Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

5) A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

6) For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

7) An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

8) The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Thank you again.

Correspondence: I'd ask you to consider the 1996 beginnings of the elimination the trapping, baiting & hound hunting of cougars & bears in Washington State as a guide to the pitfalls of laws brought about by ill conceived plans of government when it comes to wildlife. The effects of these decisions have allowed more frequent interactions between dangerous predators and humans as well as livestock within the state. Reliable coonhound operators have left the Northwest never to return due to this decision. Predators do not live and stay within imaginary lines from a map, look no further than the introduction of wolves in the state to see the deviation to livestock in Eastern Washington. The proposal to release grizzly bears into our state is a huge mistake that will endanger the public and their livelihoods.

Correspondence: I support option A: no action at this time

Climate change factors:

Climate change models for the North Cascades suggest longer periods of high temperatures in the summer, greater precipitation in autumn, spring and fall with freezing temperatures occurring at higher than normal elevations that could affect grizzly populations denning later and an earlier end to hibernation affecting cub viability. Both situations increasing likelihood of human encounters as bears seek food for longer periods of time.

Wildfire, insect infestations, increased flooding and landslides could diminish bears preferred foods, such as whitebark pine seeds (already happening) and sambuca berry decrease (already happening). Since bears are adaptable, smart, opportunistic, and omnivores relocated bears from habitats where forbs and berries are their main food source will no doubt add threatened Chinook to their diet. Grizzlies do help turn the soil and spread seeds but they also love caraway an invasive non-native and Canada thistle. While there are climate change model predictions for the NCE we still can not predict what will actually happen to the environment in the decades to come.

Grizzly and black bear incidents have increased this year in British Columbia, and Yellowstone, and Colorado as bears become less afraid of humans, are hungrier and wander urban areas. Aversive deterrents directed by humans have proven ineffective as bears are able to figure out how to avoid being hit by rubber bullets, etc. Electric fencing around entry doors, around gardens, playgrounds, rv parks, does work but then who are now the displaced? Bears in the NCE area in 1975? I can't find any evidence that this is true.

This is a risky endeavor for the bear, other threatened and endangered animals, plants and we humans.

I am in sympathy with conservation groups but not on this issue.

- Reintroduce wild bears from populations as close to the North Cascades Ecosystem (ECE) as possible and ideally, from habitat types as close to North Cascade as possible. You want bears that are as co-evolved and adapted to the North Cascade ecotypes as possible, otherwise it is a non-native local species introduction and is not as likely to succeed. The transplant bears should be from bears that are as far away from people and towns as possible. You want bears that fear people. Consider epigenetics in bears for transplant. Learned behavior is passed on to young without genetic mutation, so you want bears that are fearful of people. Ideally, avoid bears from known populations (lineage) with a history of interactions with people.
- It would be best to have bears from different age classes to buffer for loss of breeding age animals.

:

- The restoration of grizzly bears will benefit the natural value of wilderness because the native species are functionally extirpated from the NCE. The limited adverse impacts from alternative B would be offset by restoring a native species, a beneficial impact. " DEIS Page vii This is weakly supported, because there has been no analysis of the ecology without bears versus with bears. What are the benefits ?
- A more passive action alternative based on luring bears into the area with pheromones should have been evaluated. Has this been done with other species ? Is it possible to increase the probability of population establishment by bringing potential mating pairs into the NCE with the use of pheromones th? This would be a way to avoid public opposition to "transplanting" bears and a more natural way of encouraging bears to enter the NCE.

* i don't think that a good case has been made for why grizzlies are not coming back on their own in the NCE. Bears go

where there is less competition for food and mates, not concentrate in areas with greater competition. Where is the evidence that numbers in Canada are not sufficient to have enabled bears to move down and establish in the NCE ? What other factors could result in non-establishment of the bears ? What is different now than in times when there were bears present ? Are there studies that show how many grizzlies exist north of the border ? Show that the Fraser River presents a barrier to grizzlies occupying the NCE. I think to treat without knowing and discussing causation for bears not establishing in the NCE is malpractice.* I am for having a healthy population of grizzlies in the NCE, but I am not convinced that this will work when there has been plenty of time for grizzlies to establish on their own and it has not happened.

* I think my pheromone alternative for luring bears into the NCE demands analysis.

Correspondence: I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife

populations.

I support Alternative C: Restoration with Section 10(j) Designation. Alternative C is the best choice for bears and the people who live in and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you for taking the time to keep our North Cascades wild!

Correspondence: U.S. Fish and Wildlife Service,

I am writing to you as an ecologist with a traditional educational background and professional experience in the field. My purpose in writing is to express my support for the restoration of grizzly bears in the North Cascades ecosystem.

As a professional in ecology, I have a deep understanding of the pivotal role that keystone species like the grizzly bear play in maintaining the health and balance of our ecosystems. Grizzly bears contribute significantly to ecological diversity, helping to regulate prey populations and maintain forest health through their activities. Their presence in the North Cascades would not only be a boon to the ecological integrity of the area but also a symbol of our commitment to conserving our natural heritage.

Moreover, the reintroduction of grizzly bears is likely to have positive economic impacts. Based on studies and observations from other regions where large predators have been reintroduced or conserved, there is a strong potential for increased tourism. Nature enthusiasts, wildlife photographers, and outdoor adventurers are often drawn to areas where they can experience such majestic wildlife in their natural habitats. This increase in tourism would not only boost local economies but also generate additional tax revenues, which could be strategically reinvested into further conservation programs and ecological research.

I believe that the restoration of grizzly bears in the North Cascades, particularly through Alternative C, is a step toward a more balanced, diverse, and thriving ecosystem. This action would not only reaffirm our commitment to biodiversity but also demonstrate a forward-thinking approach to wildlife management, where economic benefits align with ecological health.

Thank you for considering my views on this important matter. I look forward to seeing positive steps taken towards the restoration of the grizzly bear population in the North Cascades and am eager to support these efforts in any way I can.

Sincerely,

Correspondence: I am an avid backpacker and outdoor person. I'm used to being careful in the backcountry, but am very concerned about the introduction of grizzly bears into the Cascade mountains. Grizzlies do not behave like black bears, who are afraid of people. Grizzlies, on the other hand are aggressive and actively go after humans when confronted. They have very large territories. While the area where they are proposed to be released into is sparsely populated, it is well known and used by people like myself. There is extensive trail and forest service use in the proposed area. Grizzlies currently exist in remote areas of Washington state now and are habituated, so why do we need to introduce more? This proposed land for locating the bears butts up against farm lands. Bears of any kind have broad ranges, therefore could encroach on private lands and/or farms. Since grizzlies are protected, the farmers will likely be impacted by the bears attacking their livestock and have no recourse to protect their property.
I am extremely concerned about this proposal.
I grew up in Northern Idaho where grizzlies from Yellowstone were introduced in the 1970's. It caused a lot of problems because the bears were not habituated--it has taken 50 years for them to acclimate to their new territory. That being said, there have been bear attacks and problems ever since. Let's not make the same mistake in Washington.

Correspondence: Good Day
reintroductionRestoration

This comment is in response to the Grizzly Bear Plan. Specifically I appose the plan in all portions. The plan is cover for an entirely different objective, the taking of lands from various private and public, and endangers the American citizen through deceit. This under the cover of law.

The United Nations Conventions on Biodiversity was rejected. One of the principle reasons was the insertion of the "Wildlands Project" and the "Global Biodiversity Assessment Report".

The United Nations Environmental Program, calls for removal of humanity in various actions across the United States.
Publication : United Nations Global Biodiversity Assessment Report of 1995

The earliest federal land management statute requiring federal agencies to "coordinate" is the Recreation Coordination Development Act of 1963 (Public Law 88-29, approved May 28, 1963, 77 Stat. 49). This statute declared a Congressional policy that "present and future generations be assured adequate outdoor recreation resources" and that "all levels of government and private interests . . . take prompt and coordinated action . . . to conserve, develop, and utilize such [their] resources for the benefit and enjoyment of the American people."

The first statute wherein Congress began to define the coordination process is the National Environmental Policy Act (NEPA), 42 U.S.C. 4331, in 1970. Also of importance, NEPA set forth a national intention of reaching a harmonious and productive environment for the entire natural environment...including humans; it required all federal agencies to prepare studies and statements of impacts, including the cumulative impacts of any project studied; and it established the President's Council on Environmental Quality (CEQ), attached to the White House, to provide oversight of implementation by all federal agencies, whether or not there is a NEPA project involved.

Neither the "Wildlands" project, or any subset of the project, holds the human in the regards as stewards of the varying species including the grizzly. The quote is from the Administrative Director of the "Wildlands Project":
Quote # 1:
"[T]he collective needs of non-human species must take precedence over the needs and desires of humans."

- Wildlands Project Co-architect Reed Noss

Quote # 2:

from Editor John Davis - UN Wildlands Project Journal "Wild Earth": "Does ... the Wildlands Project advocate the end of industrial civilization? Most assuredly. Everything civilized must go."

Both the U.S Parks, U.S Forestry and US Fish and Wildlife, are in direct violation of items # 3, # 6 by both definition and action with the introduction of an Apex Predator. Outside the etherial, there is no balance between the violent possibilities of both the Grizzly and grey wolf. This apex threat, is the exact reason the evidence is clear, that the "Wildlands" Project is the tool being used to force peoples, tribes who are being used as dupes (Their words, not mine) in the deceit endeavor, most unfortunately.

CONGRESSIONAL DECLARATION OF NATIONAL ENVIRONMENTAL POLICY

Sec. 101 [42 USC § 4331].

(b) In order to carry out the policy set forth in this Act, it is the continuing responsibility of the Federal Government to use all practicable means, consistent with other essential considerations of national policy, to improve and coordinate Federal plans, functions, programs, and resources to the end that the Nation may --

1. fulfill the responsibilities of each generation as trustee of the environment for succeeding generations;
 2. assure for all Americans safe, healthful, productive, and aesthetically and culturally pleasing surroundings;
 3. attain the widest range of beneficial uses of the environment without degradation, risk to health or safety, or other undesirable and unintended consequences;
 4. preserve important historic, cultural, and natural aspects of our national heritage, and maintain, wherever possible, an environment which supports diversity, and variety of individual choice;
 5. achieve a balance between population and resource use which will permit high standards of living and a wide sharing of life's amenities; and
 6. enhance the quality of renewable resources and approach the maximum attainable recycling of deplete-able resources.
- (c) The Congress recognizes that each person should enjoy a healthful environment and that each person has a responsibility to contribute to the preservation and enhancement of the environment.

The flow of regulation requires "coordination, not consensus, or other manipulations. It is not a requirement of Counties to demand "Coordination although many have, Wallowa County and U.S. Forest Service,

Following are some of the federal statutes requiring coordination:

16 U.S.C. 1604, the National Forest Management Act (NFMA), 1976 (Directs the United States Forest Service)

42 U.S.C. 4331, the National Environmental Policy Act (NEPA), 1970 (Directs Federal plans, functions, programs and resources)

16 U.S.C. 1533, the Endangered Species Act (ESA), 1973 (Directs the United States Fish and Wildlife Service)

16 U.S.C. 1271, the Wild and Scenic River Act (W&SRA), 1968 (Directs the National Park Service)

PL 88-29 (77 Stat. 49), the Recreation Coordination and Development Act, 1963 (Directs the National Park Service)

42 U.S.C. 7401, the Clean Air Act (CAA), 1970 (Directs the Environmental Protection Agency)

43 U.S. C. 1711, the Federal Land Policy Management Act, 1976 (Directs the Bureau of Land Management)

33 U.S. C. 1251, the Clean Water Act (CWA), 1972 (Directs the Environmental Protection Agency)

16 U.S.C. 2003, the Soil and Water Resources Conservation Act (SWRCA), 1977 (Directs the Soil and Water Conservation Service)

16 U.S.C. 1382, the Marine Mammal Protection Act (MMPA), 1972
(Directs the National Oceanographic and Atmospheric Administration)

16 U.S.C. 1431, the Marine Protection, Research, and Sanctuaries Act (MPRS), 1972 (Directs the National Oceanographic and Atmospheric Administration)

16 U.S.C. 1451, the Coastal Zone Management Act (CZMA), 1972
(Directs the National Oceanographic and Atmospheric Administration)

16 U.S.C. 1801, the Fishery Conservation and Management Act (FCMA), 1976 (Directs the National Oceanographic and Atmospheric Administration)

Statutes are in "pari material" and thus must be read together and consistently.

Professor Sutherland's definitive work "Statutory Construction," Section 5202, states: "Statutes are considered in "pari material" to pertain to the same subject matter when they relate to the same person or thing, or the same class of persons or things, or have the same purpose and object."

FLPMA and NFMA are statutes in "pari material" because they both relate to management processes, procedures and directives from Congress by which the BLM and USFS must manage the public or federal lands. They even represent enactments by the same session of Congress, and they have the same "purpose and object." And the United States Supreme Court has enunciated this principle on scores of occasions.

The Counties in the path of this violation of Federal Statutes, Benton, Adams, Yakima, Okanogan, and any missed, by volumes of activities is prime facia demand for coordination.

The most troubling part of all of these transgressions, is the fact the malefactors know the deceitful intent of the "Wildlands" project,

and while in pretense of following some edict, put American citizens in harms way, in total contravention of the facts in evidence of Apex predators.

To all who might read this: The actions of Military conflict and the actions of Political conflict are in fact twins. Both entities use deceit to gain ground, and must continue until the objective is obtained.

The objective of this propaganda filled war, is the removal of humanity, by the leaders own words.

The support of the endangered species, depends on stewardship by peoples committed to do so, and bureaucracy is the worst, both in war and politics.

One last item concerning Humanism verse human as a dictionary term. Humanists claim animal species above man. I attach the

United Nations UNESCO philosophy by Sir Julian Huxley:

1945 - The United Nations Charter (Not Treaty) was signed. Here is one of the greatest lies perpetrated on the Global Public. The structural White Papers of the United Nations managed, and generated by 50 CFR members (including the Rockefeller "Lenin Institute" members) previously inserted into the United States Government and Universities in many administrative positions. This in concert with the RIIA of Great Britain. The Dumbarton Oaks, story is only partly true. This action was handled by Alger Hiss of prior note, who was later imprisoned as a Soviet spy and who had been Roosevelt's right hand man. Alger Hiss, Soviet spy, was known to Roosevelt who casually dismissed the notification. Hiss was at both Tehran and Yalta. This begins the current living History, that gets us to today.

UN. Not Known: http://www.slideshare.net/slideshow/embed_code/38199716

1946 - UNESCO Education is instituted. 1946 - 1948: 1948: UNESCO: Its Purpose and Its Philosophy by Sir Julian Huxley (the first director-general of UNESCO, 1946-1948) is published, in which Huxley declares: "The general philosophy of UNESCO should be a scientific world humanism, global in extent and evolutionary in background... Political unification in some sort of world government will be required...Tasks for the media division of UNESCO (will be) to promote the growth of a common outlook shared by all nations and cultures...to help the emergence of a single world culture... Even though it is quite true that any radical eugenic policy will be for many years politically and psychologically impossible, it will be important for UNESCO to see that the eugenic problem is examined with the greatest care, and that the public mind is informed of the issues at stake so that much that now is unthinkable may at least become thinkable." Excerpts from this

volume were reproduced under the title, "A New World Vision" (The Humanist, March/April 1979), and the Fabian Socialist Huxley, who was named 1962 "Humanist of the Year," elsewhere said that humanism's "keynote, the central concept to which all its details are related, is evolution." Also, it was Sir Julian Huxley (brother of Brave New World author Aldous Huxley, and grandson of Thomas Huxley who was known as "Darwin's Bulldog" because of his defense of evolution).

Correspondence: I would like to express my opposition to the draft to reintroduce grizzly bears to central Washington state. I am unfamiliar with any positive aspects of introducing this apex predator to an area that has been without them for such a long period of time. The negative aspects of creating a new danger for hikers, hunters, and outdoor enthusiasts; possible predation of livestock; and property damage potential from wandering bears all seems to outweigh any positive benefits to reintroduction. Keep them out!

Correspondence: NO re-introduction of grizzlies into Washington state, period!!
Additionally, grizzlies may migrate into Washington state territories from Canada, and impact livestock, humans and properties, there NEEDS to be a rapid system to either quickly relocate them, or neutralize them.

Correspondence: The plan to reintroduce the grizzly bear to North Central Washington is, to be frank, foolish. The way you state it in your Restoration Plan sounds so benign: "Provide Pacific Northwest residents and visitors with the opportunity to again experience grizzly bears in their native habitat." The "opportunity to experience" grizzlies would have been gladly forgone by hunter Rudy Noorlander, who had his jaw torn off by a grizzly in Montana in early September 2023. Amie Adamson, the hiker who was killed by a grizzly in July, 2023, would also, I'm sure, been happy to avoid the "opportunity." The grizzly who killed her also broke through a kitchen window of a house in September, so not only will this reintroduction endanger hikers and hunters, but even people inside their own homes. Further, the nice little black line outlining the area you will be putting the bears looks so neat and tidy, but bears don't read maps and understand they are supposed to stay within certain boundaries. Third, the deer and elk populations in Washington are always a concern, and adding grizzlies back in as predators can only put more negative pressure on their populations. Grizzlies are grand creatures, to be sure, but they need and deserve remote areas where they will not be in much contact with humans. Leave them to the remoter areas of the states with less population, and allow Washington to remain a safer area for its larger population. Do not reintroduce the grizzly bear back into North Central Washington State.

Correspondence: I live in the foothills of the North Cascades and recreate in and near the park extensively. I have seen an uptick in both predator (bear, cougar, bobcat, coyote) activity as well as human traffic. I think covid brought people outdoors more than ever. It is great to see so many people experiencing, and subsequently, advocating for these wild spaces. However, more people equals more people and trails and trailheads are packed, even on the less mentioned trails on social media. I mention this because with the uptick of predators and more human traffic in the North Cascades, adding an apex predator to this situation seems shocking and absurd. I try to keep an open mind on most matters and find myself playing Devil's Advocate often and I just can't wrap my head around why this is a good idea overall. Washington state has one of the highest population densities of any western state with, possibly, the least public land in all the west. Grizzly to human interaction will be unavoidable.

There are already grizzlies in Washington. There are no barriers impassable for grizzlies to reach the North Cascades from areas like B.C. and Idaho. If the Grizzlies want to be here, they will grow the population here naturally, giving the prey (and other predator) populations opportunities to naturally grow accustomed to this "new" predator. I don't often believe in doing

nothing is the best course of action, however when it comes to this Grizzly reintroduction, I believe option A (doing nothing) is the best option for Washington and its wildlife.

Thank you.

Correspondence: I am completely against grizzle bear re introduction. As a mom and hiker, I have no interest in bringing grizzlies back into the area.

You will loose advocates of these woods when people do not feel safe going into them anymore. The woods will become more distant, a dangerous place and then more threaten because people won't care as much anymore when they are not ever in them. I came from the Midwest and the PNW taught me how to fall in love with nature. We have a great connection with people wanting to hike and camp and explore this amazing place. Having grizzlies in the are will stop people from going out. It will stop me and my family and many I have talked to about this. All people who currently hike. So now, this next generation will not be raised with the same forest time and understanding of how important time in nature is. Because even knowing how important forest time in, I will not bring my family into the woods with grizzlies.

This is an animal that bear spray will not help. Just look at the educated and well seasoned couple in Baff

Don Striker, Superintendent
North Cascades National Park Service Complex
810 State Route 20
Sedro Woolley, WA 98284

Dear Superintendent Striker:

Back in September of this year, the U.S. Fish and Wildlife Service (USFWS) and the National Park Service (NPS) released the Draft Grizzly Bear Restoration Plan/Environmental Impact Statement, North Cascades Ecosystem. This plan is a culmination of a multi-year process to evaluate the options for restoring grizzly bears to the North Cascades, an area known

to have historical residency for bears. The public comment period is about to close, and our organization would like to provide comments at this time. The issue of populating grizzly bear recovery zones is indirectly, if not directly related to the issue of grizzly bears here in Montana. More information on that below, but first a little information as to who we are.

The Gallatin Wildlife Association (GWA) is a local, all volunteer wildlife conservation organization dedicated to the preservation and restoration of wildlife, fisheries, habitat and migration corridors in Southwest Montana and the Greater Yellowstone Ecosystem, using science-based decision making. We are a nonprofit 501 (c) (3) organization founded in 1976. GWA recognizes the intense pressures on our wildlife from habitat loss and climate change, and we advocate for science-based management of public lands for diverse public values, including but not limited to hunting and angling.

As you very well know, the North Cascades Ecosystem (NCE) is one of six recovery zones across the Pacific Northwest and northern Rocky Mountain states that has had landscapes set aside to harbor a population of grizzly bears. These ecosystems were established on landscapes that had the ability to facilitate the Grizzly Bear Recovery Plan. In fact, according to the 2021 Annual Report of the Grizzly Bear Recovery Program (GBRP), the mission is stated thusly.

"The mission of the Grizzly Bear Recovery Program (GBRP) is to recover grizzly bears in the lower-48 States by implementing the Grizzly Bear Recovery Plan (USFWS 1993, 1996, 1997, 2007, 2017, 2018) and coordinating research, management, and recovery efforts. To accomplish this mission, we collaborate with the Interagency Grizzly Bear Committee (IGBC), Federal, State, and Tribal agencies, the provinces of British Columbia (B.C.) and Alberta, as well as non-governmental organizations (NGOs)."

The Greater Yellowstone Ecosystem (GYE) is another one of those six ecosystems. The purpose of the GBRP is to determine lands capable of providing food, shelter, and safety as well as large landscapes where recovery efforts can focus on conflict reduction and reducing human-caused mortality. Another purpose of the GBRP is to facilitate the connectivity of each ecosystem, each with the other, to prevent populations from becoming isolated, stunted, and adversely affecting the health and population of the species. We should also say that of the six grizzly bear recovery ecosystems, only two, the GYE and the Northern Continental Divide Ecosystem (NCDE) have a significant population of grizzly bears.

This in and of itself should be a primary concern. This tells us the goals and mission of the GBRP are not being met and will not be met until all recovery zones have substantial populations of bears. But in addition, there needs to be connectivity from one recovery zone to another. Presently we are far from meeting that goal. That not only hinders the genetic health of grizzly bears within the NCE population, but the overall health of bears overall. One of our primary goals as a wildlife advocacy organization is for connectivity to be reached by large migrating species as this helps ensure genetic health as well as overall health of the entire population of species, including bears, across the Northern Rockies and the Pacific Northwest.

Conditions on the Ground:

This plan then, the Draft Grizzly Bear Restoration Plan, is an attempt to fulfill GBRP's mission, to establish a sustainable population of grizzly bears in the northern Cascades and northern Rockies. GWA supports the restoration of grizzlies to the North Cascades, but it must be done in a way that does not violate the specifics and intentions of the Wilderness Act or the character of wilderness or in a way that hinders the growth and development of the other recovery zones.

On pages i and ii of the draft plan, there is this statement.

"There has been only one confirmed detection of a grizzly bear in the greater NCE in the past 10 years, which occurred in British Columbia (IGBC NCE Subcommittee 2016; Rine et al. 2020). Since there has been no confirmed evidence of grizzly bears within the NCE in the United States since 1996, any remaining bears in the NCE would not meet the accepted definition for a population (i.e., evidence of 2 adult females with cubs or 1 adult female tracked through two litters). Therefore, the FWS considers grizzly bears to be functionally extirpated in the NCE (FWS 2022)."

This is disappointing news and describes the associated problem with many species across the west. Populations of not just grizzly bears, but many species, are no longer prevalent upon the landscape since the time of the westward expansion. The factoid that grizzly bears only occupy 2% of their former range needs to be restated here. Habitat fragmentation, hunting, agricultural interest, and wildlife/human conflicts have driven many species close to extirpation, especially those that are

predators.

According to statements on page v of the draft plan, the goal would be to transport 7-10 grizzlies per year for 5-10 years until a goal of 25 bears are reached, then supplement that population as needed over time until a final goal of 200 grizzlies is reached in the NCE. These bears would be transported from the sources of Wyoming, Montana, or British Columbia. If you have been following conditions in Montana and those of the GYE and the NCDE, actions within our state have become quite political. Perpetuated by state officials, the states of Idaho, Wyoming, and Montana have petitioned the USFWS to delist the grizzly bear. GWA is arguing against this action as it is believed the state is acting upon fallacious reasons, but this move highlights the political atmosphere in the state.

GWA has concerns over the removal of grizzly bears from the state of Montana. Removing bears from the GYE is problematic as according to the Endangered Species Act of 1973, grizzly bears have yet to fully recover. Connectivity has not been reached between the GYE and the NCDE or with any other of the Grizzly Bear Ecosystems. To put it bluntly, our state's grizzly bear population is suffering from the hands of bad behavior, from politicians and some elements of the public. Many fear our grizzly bear population may not be as stable as many officials claim.

Mortality of grizzlies in the state seem to be growing from human/bear conflicts. Whether it be from trigger-happy hunters who seem more willing to pull the trigger on a rifle than a can of bear spray or from vehicle/bear collisions, the mortality of grizzly bears in the state is raising a new level of concern. On top of that, if the state's request to delist grizzly bear is honored by USFWS and delisting occurs, we fear the death rate of grizzly bears will increase greatly due to these hunting and trophy hunting pressures. This most certainly would jeopardize bears from reaching connectivity.

This is the current problem as it exists on the ground. The GYE is an isolated ecosystem in terms of grizzly bear connectivity and has been at the heart of GWA's and other NGO's mission for some time. It is one where the state of Montana is determined, under the current political atmosphere, to continue into the future. Many advocates are just focused on trying to gain connectivity between the GYE and the NCDE and/or the Bitterroot Ecosystem (BE) of eastern central Idaho.

The Alternatives and their Weaknesses:

Pages iii and iv describe the three alternatives being considered under the draft plan. A brief description of each is below.

Alternative A:

"Under alternative A (no action), existing management practices would be followed. Under the no-action alternative, options for grizzly bear restoration would be limited and rely primarily on natural recovery. Current management actions would continue, focused on improved sanitation, motorized access management, outreach, and educational programs to provide information about grizzly bears and grizzly bear recovery to the public, and research and monitoring to determine grizzly bear presence, distribution, habitat, and home ranges."

Alternative B:

"Under alternative B, grizzly bears restored to the NCE would be managed as a threatened species with the special rule (50 CFR 17.40(b)) under section 4(d) of the ESA governing the regulation of grizzly bears in the lower 48 states and NPS regulations in 36 CFR, chapter 1, governing resource management in areas within the NPS's jurisdiction. This rule allows grizzly bears to be taken under specific circumstances, as long as such take is reported promptly to the FWS."

Alternative C:

"Under alternative C, the FWS would designate grizzly bears in the US portion of the NCE and surrounding areas as a nonessential experimental population (NEP) under section 10(j) of the ESA. An experimental population is a group of translocated plants or animals (inclusive of their progeny) that is geographically separate from other nonexperimental populations of the species. In designating populations as experimental, the FWS must determine whether they are "essential" or "nonessential" to the survival of the species as a whole and must consider the relative effects of establishing an experimental population on the species' recovery."

GWA is against these Action Alternatives as currently written. In the further reading of the draft plan, it is stated that each of these action alternatives would be a violation of the Wilderness Act of 1964. Our organization has been down this road before concerning actions into wilderness areas. On page vi of the draft plan, further explanations are provided according to Alternative B. But we also note that Alternative C has a similar intent.

"Under alternative B, the use of helicopters near active wildlife dens or nests during the initial release of grizzly bears into the NCE could disturb denning mammals or nesting birds; however, this disturbance is expected to be limited to approximately 144 flights over a 5-to-10-year period and would be limited to 3 to 7 days per year from June through September."

There are principles behind the intent of these fundamental building blocks of the conservation movement. Whether it be the Wilderness Act, the Endangered Species Act, or the National Environmental Policy Act, or any other exceptions to the law; it is a slippery slope to allow exceptions. We understand the desire to make exceptions and to rationalize those exceptions for the greater good, but there must be work-arounds in those scenarios. Every time there is an exception, it weakens the intent and implementation of the law. We must not allow the practice of adhering to one environmental building block necessitating the violation of another.

Another problem with the alternatives, particularly that of Alternative C is that it proposes the use of the 10(j) rule, a rule that would allow grizzlies of Montana to lose their protection under the ESA, if they were to be transported to the North Cascades. Essentially, the individual animals would be reclassified as "nonessential experimental population", a phrase used to describe these bears on page iv of the draft plan. This change in classification opens the door to a whole range of threat exposure to individual bears, a scenario harmful to their individual existence.

As much as we are in favor of developing a population of grizzly bears in the NCE, the removal of bears from Montana seems problematic since the bears in the state of Montana have not been fully recovered. Questions remain. We question the large plan which should be on the table. Where is it or what is it? What is the overall plan of the GBRP? How was it visioned that the GBRP was to be successful, via bear relocation?

GWA does not believe all alternatives have been explored. Aggressive transport or relocation of species (population augmentation as it is called) are not flawless in their effectiveness or result. The rights of individual bears or individuals of any species are just as important for consideration in a project's implementation. Man-made relocation of species poses risks, perhaps risks that are too great for a species that is not fully recovered.

GWA asks another question? What are the chances of a natural repopulation? We understand the draft plan believes this option is not viable. On page v, the draft plan makes this statement.

"As a result, it is unlikely grizzly bears would move into the NCE from existing populations. Few confirmed sightings of grizzly bears have been made in recent decades in the NCE on either side of the international border. The most recent confirmed observation within the US portion of the NCE was in 1996, south of Glacier Peak. There has been no verified evidence of grizzly reproduction in the NCE for at least 30 years."

But again, this raises more questions for GWA. Even though this chance may be poor, natural recovery should still be incorporated into an overall plan. Natural recovery would lessen the need of augmentation, saving dollars, diminishing mortality risks during transport, and help protect populations of recovery zones that were to lose bears. GWA does not have a good understanding to the degree of discussion between U.S. and Canadian officials nor should we, but what is the level of cooperation between the two entities? Having said all of this, we understand that population augmentation will most likely need to be part of an overall package. GWA encourages communications begin with all officials responsible for managing grizzly bears in each of the six recovery zones, including those officials in Canada to develop an overall systematic plan to facilitate bear recovery.

In the meantime, there needs to be an approach to educate and inform the public about coexisting with grizzlies and all bears. There is no reason why this should not be part of any alternative, let alone a program or plan going forth.

Conclusion:

GWA wants to be clear, we do support the concept and plan to restore grizzly bears to the NCE. But we do not support the implementation of the alternatives as they currently exist.

- We do not believe there needs to be violations of the Wilderness Act in order to release and monitor grizzly bears. Exceptions to law should not be rationalized in order to carry out the implementation of another. This only weakens the laws as written.
- GWA does not believe that population augmentation is the only method to restore populations to the NCE. We do believe that augmentation will most likely be part of the process, but we prefer to minimize that action if and all possible. It poses risks to the individuals, and we do not want to see bears lose their protection status here in Montana just because they are going to be reclassified as nonessential and experimental in Washington.
- GWA believes that natural repopulation should be explored and incorporated into all alternatives as well as the final plan.
- The Bear Smart program needs to be part of any final decision. There is no reason to eliminate the process of informing and educating the public from any scenario.
- GWA believes the removal of bears as stated under Alternative B may be too aggressive in terms of timing and number of bears removed from the GYE or NCDE. GWA would like to see an overall implementation plan of how it plans to repopulate bears in the other recovery zones rather than have a piecemeal approach.
- GWA does believe that the NCE has the resources and landscape size to recover grizzly bears and that this restoration is vital in the overall recovery of the bear into their historic range.
- Grizzly bears would improve ecological health and increase biodiversity.

These bullet points summarize the viewpoint of Gallatin Wildlife Association. Our organization wants to see success in grizzly bears repopulating the NCE, but not at the expense of harm to Montana's grizzlies or to the violation of the Wilderness Act. We think it is safe to say, we would like to see more thought and more alternatives explored to minimize the safety of ongoing grizzly bear populations.

We sincerely hope that these comments will be taken seriously and thoughtfully in order to implement action that will hopefully be done in a judicious and in a scientific sound manner.

Sincerely,

Gallatin Wildlife Association

Correspondence: Hello,

I would like to say that I am in favor of re-introducing grizzlies to the North Cascades, and giving them the space they need to thrive.

Thank you for the opportunity.

Best Regards,

Correspondence: Thank you for giving us a chance to comment. While the recovery of grizzlies in the north cascades is possible, the number of individuals in the target population is so small that its effect on the habitat, like aerating the soil and spreading seeds would be small, and is already being performed by black bears. I see no substantive reason to reintroduce grizzlies in the north cascades. They exist elsewhere and are not extinct. According to your documents they are apex predators, however you stated their diet is primarily vegetation. So they will not have a meaningful impact on controlling game animals.

Additionally, the services seem to blow off the potential risk to humans. Saying the chances would be 2m to 1, like in yellow stone. I think you should ask the families of the two hikers that were killed this year in Montana what they think, Any human death or mauling by bears is not something that can be shrugged off. They aren't here now, and let's just keep it that way.

I strongly object - The no action alternative should be selected.

Thank you

Correspondence: I am in support of reintroducing grizzly bears to the North Cascade Ecosystem. First there are my my personal beliefs that they are beautiful, natural creatures that belong there and humans should make room. They were part of that ecosystem long before we came along and deserve a place.

Then there are the more logical arguments that they are a part of they natural ecosystem, part of a healthy ecosystem and as stewards of the environment it is our responsibility to ensure that they have a safe place to succeed. The fears that they will pose a risk are just fears that only need education to correct them. People live in grizzly country in many other parts of the US and they live safely sice grizzly bears do not prey on humans. The risk to livestock is minimal, especially when natural prey is bountiful. Hikers already need to be cognizant of their surroundings in the area of the release due to black bears and cougars, so it does not need to change their hiking behavior

Grizzlies avoid human contact whenever possible. Grizzlies do not pose a risk to salmon populations and as part of a healthy ecosystem and can help stabilize them. Humans are the biggest threat to salmon.

Correspondence: The reintroduction of Grizzlies into the North Cascades is a terrible idea. As one who is an avid outdoor woman, the thought of have more alpha predators roaming the mountains is not something I look forward to dealing with. Nor is there any scientific data that can prevent these animals from dropping out of assigned ranges and into ranches and backyards of current residents. There is zero benefit from spending money pursuing a plan for reestablishing grizzlies.

Though I do not currently reside in WA, I grew up there and still have family in the state.

Correspondence: Stupid idea. One of the stated objectives in the EIS is:
Provide Pacific Northwest residents and visitors with the opportunity to again experience grizzly bears in their native habitat.

The last thing you want is to experience a grizzly in its native habitat.

When the first fatality attributable to a grizzly in this area occurs, the bureaucrats who signed off on this should be charged with accessory to murder.

Correspondence: The idea of introducing Grizzly Bears into where they used to roam...so many years ago seems to be much like the introducing of the wolves in Eastern WA. That project has not been popular with the area it was introduced.

That project created a shift in the wild animals that had adapted to NOT having the predictor wolves...

We already have a good number of bears in the North Cascades. And if I remember correctly those have sometimes caused trouble with hikers and livestock. Adding Grizzly bears would change the environment that has mostly been doing just fine.

It just does not seem like a good thing, it likely would end up like the wolves project.

Thank you for the opportunity to give comments.

Correspondence: I've backpacked in the North Cascades National Park on many occasions. As noted in the Seattle Times, "North Cascades National Park has no plans to install bear wires for hanging food or to make any changes to existing frontcountry or backcountry campsites, according to U.S. Fish & Wildlife spokesperson Andrew LaValle."

Why not? Yellowstone backcountry sites have bear wires for hanging food. It's not always possible to find the perfect tree. After a few grizzly-human incidents, will the park require bear canisters in the backcountry? This is a worse option since some will ignore the rule--increasing the likelihood of an encounter.

If the park isn't going to bother protecting its visitors, then I am against introducing grizzlies into the park. Sooner or later, a deadly encounter will happen and the park service will close whole sections of the park and impose onerous requirements on its visitors. The national park system must remain open to the people of the United States and not become a closed-off wildlife preserve.

Correspondence: Greetings, I am a hunter, I have been a hunter my entire life, I was raised in Alaska and hunting and fishing was a necessity.

For the last forty or so years, I have lived in central Washington. I spend a lot of my time in the woods, hiking, hunting and in winter, snowmobiling. My current hunting activity is focused primarily on Black Bear hunting. I see between 5-10 Bears a year, I am selective on the bear I harvest. Many years I do not take a bear, however I spend a lot of time monitoring bear activity and behavior. I may be more knowledgeable than most when it comes to bears.

Introduction of Grizzly Bears to the PNW is simply ridiculous! These are Apex predators. This move will eventually result in the death of humans. When hiking or hunting, I meet numerous hikers, who are oblivious to the dangers of Bears, Cougars and large animals. I notice most do not even carry Bear spray or a firearm, and many are in the forest with small children in tow.

The last black bear I harvested was about 50 yards away when It charged towards me. I shot three times, each time striking the bear with a .338 federal caliber round. I reload my own ammunition, and this is a powerful medium range caliber. The bear dropped about 15 feet from me. This was a medium size black Bear. Had this been a Grizzly, I don't think I would have fared well.

Please reconsider this fool hardy plan that will result in human death. Grizzly bears will have human encounters. Grizzly bears are not needed or wanted in the PNW. Don't allow a social experiment by misguided environmentalists to proceed, a project that WILL result in the death and mauling of humans.

Correspondence: I am not in support of reintroducing the grizzly to Washington state. our state is no longer predator friendly, as evidenced by wolf reintroduction. It would only be a very short time before grizzlies would start preying on livestock and then the answer is always to cave to the rancher and exterminate the guilt predator. If grizzlies migrate to Washington from Canada there doesn't seem to be much to prevent that, but I fear the same no win situation would apply. It breaks my heart to see what's happening with the wolf population and I do not wish that upon the grizzly.

Correspondence: I have hiked in many parts of North Cascades National Park and I have reviewed the Grizzly Restoration Plan. I am impressed the most by information regarding the very large territory individual bears range as habitat. Bears will not, as many maintain, self-isolate in remote areas but will go where food sources are most available. That makes it almost certain that bears and humans will cross paths as those places are areas of easiest travel. This type of interaction can have bad results for humans.

The Grizzly is not a species in danger of extinction under current land use planning. Given the danger that they would pose to human use in our North Cascades National Park artificial introduction there should not be undertaken.

Correspondence: The NPS continued efforts to reintroduce Grizzlies to the North Cascade after several previous failed attempts is abominable. Grizzlies should not be reintroduced to the 2nd most populated western state. Bears have been known to travel down from BC but do not stay because the habitat is not to their liking. The North Cascades Elk herd is well below management objective and there would be a lack of food and concerns about what these bears impacts would be on neonate survival, especially as populations adjust to the recently arrived Gray wolf. As for the Ecosystem benefits, there is no benefit that grizzlies provide that are not also provided by the Black Bear, something we have numerous of in WA.

This is yet another attempt at misguided 'conservation' and should not happen. As bears increase in BC due to their ban on hunting, they will naturally disperse to the North Cascades if the bears themselves decide it is suitable habit.

Like the Gray wolf, Grizzlies should not be listed under the federal ESA. These are species that are thriving where they already occur. The notion that they need to exist across their historic range lacks understanding of human needs and tolerances. It is a shame to see the Parks service fall victim to this environmentalist sham.

Correspondence: Dear Superintendent,
North Cascades National Park
SEDRO WOOLEY, WA

IN REFERENCE: Draft EIS Introduction of Grizzly Bears to NOCA

I have reviewed the referenced Environmental Impact Statement the U.S. F & W S and the NPS have presented in the matter of re-introduction of Grizzly bears to North Cascades National Park. As a park user I am AGAINST the idea that Grizzly bears be introduced to the area in North Cascades NP and to, more generally, the State of Washington.

These animals are known to be vicious. While I am a native Washingtonian, I resided elsewhere in this country while working for, of all things, the National Park Service. Years ago we took our then grown kids to North Cascades National Park, where we enjoyed day hikes. Before that as a youngster I went on "The Skagit Tours" run by Seattle City Light, in the Newhalem area. Were this variety of bears reintroduced as planned, I would NOT VISIT NOCA.

Also I have, on a couple of occasions, visited the Stehekin vicinity. If the Grizzlies are introduced to the park I would not go there ANYMORE either, certainly not visiting with out-of-town friends or relatives if U.S.F.W.S. brings this variety of bear in to our state.

Also previous to my National Park Service employment, in college I worked on the Wenatchee National Forest for five seasons; I, in my time "off," hiked all over the U.S.F.S. lands on its' trails which border "the now" North Cascades National Park.

I was - fifty years ago, - part of the Holden Village volunteer staff one summer. I hiked many trails in the Lucerne and Holden area, but would this species of bear be brought in, no longer want to (even if I could still do this) do that. I have walked the "hike" between the Lady of the Lake Lucerne dock and the road to Holden Village by myself in each direction. This would not be a possibly anymore due to the very dangerous variety of bear the Park plans to bring in.

Please Do Not Bring Grizzly Bears Into North Cascades National Park.

Respectfully submitted,

Correspondence: I'm writing to share my support for the reintroduction of grizzly bears to the North Cascades Ecosystem. Having hiked and backpacked in, not only the North Cascades, but in Canada, Montana, Idaho and Wyoming, where grizzly bears live, I am fully aware of being "bear aware" in remote places. Reintroduction is an important part of stabilizing these important ecosystems. I understand there is always a possibility of bear/human encounters and should those occur near residential areas, I support the humane removal of the problem bear. I expect these occurrences to be rare and believe the reintroduction outweighs the risks. Thank you.

Correspondence: NO. Just don't do it. Do not introduce grizzly bears to the North Cascades. I have been hiking in the Cascade Mountains in Washington, including frequently in the North Cascades for 45 years. I have also been twice to Banff and Jasper parks in Canada. I do not want to see signs at all of our trailheads: "Parties of 6 or more required" "All hikers must carry bear spray". That's Canada, don't even think about backpacking with your children. Those

signs are there for a reason. I do not want to have to always hike with 5 other people, or to be afraid of backpacking, sleeping in a flimsy tent, hiking around a bend in the trail at the end of the day, tired and sore and near to where I plan to camp, and then there is a grizzly. Why should women have to plan hiking around their menstrual period, because yes, women have been attacked by grizzlies, while menstruating, in Glacier National Park, do not pretend that it's not a problem. You also cannot ignore the recent grizzly attacks in Montana. "Grizzlies are no more dangerous than black bears" is not really true and you know it. In Alaska and Canada people frequently carry rifles and portable electric fences for camping in grizzly territory, I spent a summer in the Canadian Arctic, doing research in polar bear territory, we carried rifles at all times. I don't think we are prepared to do that here in Washington.

Also, as our climate changes, the park will change, and the mix of animals in it will change. The apex predators will become stressed and therefore more aggressive toward humans, it's inevitable. Why introduce another apex predator to become stressed? It won't be more than a few years and we will see the parks working to maintain some kind of stable ecosystem, but one that won't look like the existing ecosystem. I think you should begin to look at that task, instead of this dangerous idea to re-introduce the grizzly. Canada can keep the grizzlies; they are not endangered there.

In addition to the problems presented by climate change, the mountains in Washington state have seen a large increase in the number of hikers, especially since 2020. Is not part of your job to provide recreational activities in the National Park? Why introduce another safety problem. I am a hiker, I'm not some armchair "save the bears" person. I have hiked around many bears, please listen to me.

Correspondence: If possible please withhold my personal identity information. Thank you.

I am writing in support of the reintroduction of the Grizzly to the North Cascades. I believe the more our ecosystems can be restored the stronger they will be. We need the wild in our wilderness. I know the Grizzly is a dramatic animal because of its size and reputation but it too has a right to life. And it fills a space in nature.

It does not bother me if some human activities must be curtailed or areas restricted. Humans do not all the areas to recreate. Our lives are enriched by a thriving environment.

Correspondence: Superintendent Striker spoke of the likelihood of grizzly bears naturally migrating from Canada to the North Cascade ecosystem. This would allow a natural reintroduction of grizzlies without having to literally "manhandle" their reintroduction process using noisy helicopters and other man invasive tools: all extra expenditures to boot. There are many roads that bisect the reintroduction area if indeed there becomes a need to translocate the grizzlies. However, Montana really doesn't have the "extra" grizzlies to lose based on they are not really yet recovered there.

Please reevaluate the two action alternatives to stay within wilderness character. Both alternatives violate the Wilderness Act. An alternative that combines a natural recovery with necessary population augmentation under full ESA protections should be analyzed.

Also the "no action" alternative has many good Bear Smart components that should be included in all the offered alternatives.

Correspondence: We have hiked in Canada where grizzly bears are located. Canada has signs on trail heads that hikers must be in groups of 5 or face a fine. In addition, rangers with shotguns are in constant patrols on the trails. If the US followed similar rules, it would greatly affect recreational hiking, as individual hikers or couples would not be free to roam the forest. In addition, you would not want bears near population centers like Bellingham or near heavily hiked areas on Mt. Baker.

Since the bears are near the US border in Canada already and/or will be relocated there by Canadian tribes, they will eventually make their way down into Washington. There is no need to accelerate the process on the US side of the border.

Correspondence: As an avid hiker and backpacker, I am strongly opposed to intentionally re-introducing grizzlies to the North Cascades. There are two reasons for my opposition to this plan.

First, grizzlies are aggressive and in areas with a large grizzly population, humans are regularly killed in unprovoked attacks. Therefore, intentionally re-introducing this species increases the risk to humans engaged in wilderness recreation and may require hikers and/or backpackers to avoid using some areas in the North Cascades, further increasing crowding and pressure on an already limited resource of recreational wilderness.

Second, because re-introducing this species may limit opportunities for safe wilderness recreation, it is likely to have a long term effect of reducing public support for national parks and wilderness if gives the impression that the National Park Service is essentially choosing to reduce rather than support people recreating in the back-country.

Correspondence: As a Washington-state resident, who actively using the outdoors and who owns a second, country home in Lyle, WA, at the foot of the Cascades, I whole heartedly support the re-introduction of grizzlies to their natural habitat in the Cascades.

I believe and know from reading articles on the subject that mankind (aka ranchers) and grizzlies can co-exist. I also know that the eco-system benefits from having an apex predator in the system.

To support their re-introduction, I would suggest that the NPS coordinate with WSDOT and the FHA to build more land-bridges over the highway system to encourage migration of animals across the Cascades.

Lastly, I would like to thank you for doing this!

Correspondence: I would like to see the grizzly bear reintroduced in the north cascades. My family and I regularly enjoy the north cascades with skiing and hiking at Baker Mtn. I think the limited and gradual introduction that you are proposing will allow all sides and participants to adjust as needed to the new dynamics involved. We have adult sons who have families

living in rural Whatcom Cty. They would like to see this proposal move forward. We also have relatives who have lived in the Glacier area of Montana for many years. They are careful and respectful with the grizzly population but feel that the environment is profoundly richer because of them.

Correspondence: I am writing to encourage the adoption of the Preferred Alternative C for grizzly bear restoration in the North Cascade National Park. I have followed the plan to restore grizzly bears since it was first introduced in the 1970s and while I support the concept, there has been a significant increase in human activity in the park and surrounding area in the intervening years. For example, my daughter and her family now own recreational property along the Cascade River and I personally witnessed several hundred people on a day hike to Cascade Pass. Therefore, I believe that designating the grizzly bear restoration as an experimental population under Section 10 of the Endangered Species Act is the appropriate approach to allow maximum management flexibility to make changes or possibly halt the program if necessary.

Correspondence: I support Alternative A. I am in and using North Cascades National Park an average of 3 times a month, year round. I also use the neighboring National Forest lands frequently.

The plan to transplant these apex predators into the Northern Cascades is unwise and contrary to the North American Wildlife Conservation Model. Grizzlies haven't been hunted in several decades and there are grizzly bears to the north in BC. Why haven't they repopulated on their own with no hunting pressure? Because the habitat will no longer support them. Your proposal not only endangers the animals you seek to "protect", but prioritizes these predators over other wildlife AND human beings in the area. If there were a void, nature would fill it. Stop playing God and return to practicing sound scientific wildlife management. Do not transplant grizzlies into the Northern Cascades.

Let this one go. Why are you pushing it so hard?

Reintroduce Wolves in Washington, D.C.

Reintroduce Cougars in New York City.

Reintroduce Bears in Chicago.

Reintroduce the plain and simple idea to stop Human meddling in Nature's affairs. There was an old fable about this, starts small and then they ended up sending in the Elephants. But what will crop the Elephants?

Stick your nose back into your own backyard and feed some squirrels if that's what will help you sleep better at night. We have plenty of Black Bears in the North Cascades.

Correspondence: Grizzlies have been able to co-exist with humans in BC, the Yukon and Alaska with relatively few attacks against humans. If reintroduced to the North Cascades odds are very low that most people would never see one, even at a distance. Science shows they are very beneficial to the ecosystem in which they live and are considered a keystone species. Please do not let fear and ignorance about these beautiful animals guide your decision making process. I for one would be thrilled to have an opportunity to see a grizzly while hiking or camping in the North Cascades. As it is I travel to Yellowstone at least every other year in hopes of seeing these majestic creatures and the wolf packs living in the park. Please bring the bear back to it's rightful place place in our state.

Correspondence: I strongly support the reintroduction of Grizzly Bears into their former territory of North Cascades National Park.

We have the responsibility to do everything possible to help the population grow, as it continues to remain on the Endangered Species List.

Many experienced hikers that go backcountry already know how to adjust their awareness when they hike in Glacier or Yellowstone National Parks.

The concern of private livestock owners should not dictate the the need for improving the range for the bears, as it is our responsibility to help improve bear populations, we must accommodate the bears and coexist.

I support Alternative Plan B.

Correspondence: It is quite unclear what the intended goal for the reintroduction of the grizzly into the North Cascades. This seems to me a complete misunderstanding of the balance of nature, and an attempt to steer the natural process, just for the satisfaction of the few.

Who benefits from this restoration? I think it is grizzly, rather than other wild lives in the region including many humans. If NPS is really looking for the restoration of the nature to many centuries ago, NPS should also look into restoration of grey wolf and lynx at the same time rather than the grizzly alone. (NPS may also want to fund to mature genetical engineering to restore mammoth population around this region.)

I thus oppose the forced restoration of grizzly into the North Cascades.

Correspondence: An extremely well thought out and detailed plan! I have no idea whether you're hearing from people who are opposed to the plan, but I did want to add my voice in support.

My concern is about climate change, which is somewhat addressed in the draft plan, but mostly from the perspective of whether re-introduction of grizzlies will impact the climate. My concern is how climate change will impact the ****grizzlies**** environment, causing them to perhaps need to expand their territories in order to find sufficient food/water/shelter - and how the human-managed areas nearby will react. Another concern is the impact climate change will have on those nearby human-managed areas which would then lead to humans claiming the need to encroach on protected habitat

My preference, and suggestion, is that the NPS make it clear that re-introducing grizzlies in and of itself RESTORES the habitat, and should therefore remain the higher priority.

NPS needs also to be clear that maintaining and protecting sufficient wilderness to support a grizzly population is a higher priority than accommodating human expansion into grizzly habitat when climate change degrades land that humans occupy and use (whether for habitation, agriculture, or recreation). To put it simply, when climate change makes it harder to grow certain crops or hunt certain animals, the humans can change what they eat, or even relocate. Grizzlies cannot (not without becoming prey in non-protected areas).

The NPS can't say this, but I can: There is no shortage of humans, humans are not endangered, humans will not die out. Grizzlies, on the other hand, are vulnerable to climate change in ways humans are not; therefore, grizzlies should take priority. (I would and do make the same arguments for any non-human species whose habitat, food supply, and general well being are at risk for degradation or elimination due to human pressures.)

Climate change is humans' fault. Not the fault of the wild creatures. Changes to agricultural, hunting/fishing, and wilderness harvesting in general caused by climate change SHOULD NOT result in a further penetration of wilderness by humans, a further degradation of wilderness by humans, or a further elimination of wild species by humans.

I think it would be prudent if the NPS could say so in its plan, albeit much more diplomatically than I have.

Thank you.

Correspondence: I am adamantly opposed to the introduction of Ursus Horribilus to the North Cascades in WA. I've had close encounters with grizzly bears while in MT and they are a very dangerous animal with a completely different attitude towards humans than black bears. Most people in WA that live or recreate in the proposed new grizzly range are only used to black bears that generally run away immediately when they see a human. Not so for grizzlies, they size you up and are not intimidated at all by humans. The people that will encounter grizzlies if introduced are ill prepared for an encounter with an extremely dangerous predator like grizzlies, there will be people killed and injured, that's a given based on anywhere grizzlies live. There was a good reason grizzlies were killed on sight (I don't agree with this at all) because they are so dangerous to man and livestock.

Correspondence: I reside in the Methow valley and have hiked and backpacked in the North Cascades and Pasayten wilderness for many years. I am opposed to the reintroduction of Grizzly bears in our region. The threat to human life with Grizzly encounters cannot be denied. As recent as last summer and fall there were several fatal bear attacks reported in Montana, Canada, and Alaska. Among the victims were experienced hikers and campers and took all the recommended bearwise precautions. In one instance an empty can of bear spray was found at the site, presumably discharged without

success. Grizzly's in Washington? No thanks! Afraid? You bet! I can't imagine sleeping in a tent again knowing these apex predators are possibly near.

Correspondence: I vote NO on Grizzly bears in Washington State.

It would be terrifying to have them back. I do not want to go hiking and feel like I need someone with a rifle with me.

I certainly do not want them to be so close that they could swim to where I live. There is a reason they were wiped out of the area in the past. They are huge animals with long claws and teeth, are extremely dangerous, and can kill with no problem. They can easily attack not only people on foot, but can break into someone's home or car with no problem.

Correspondence: I'm an outdoor backpacker and climber who frequently recreates in the North Cascades. Grizzly bears should not be deliberately introduced back into the North Cascades unless there is an absolute ecological imperative to do so. These bears have been gone for a long time now and there are more and more hikers every year. Our healthy black bear population is increasingly in contact with humans in more populated mountain areas (walking around town in Leavenworth, for example). Grizzlies are highly aggressive apex predators, known for charging and attacking without reservation. Our trails and backwoods are heavily used and more so all the time. The plan to reintroduce sounds to me like a very expensive recipe for disaster.

Correspondence: First let me give you some background about me, I worked in Alaska from 1983 until I retired in 2011, 17 years of that time was in Valdez, where the bears, both Brown bears & Black bears are common during the summer fish runs. I am very familiar with identification of Brown bears, mainly by the shape of their ears. Last year in September while driving up Highway 2, I watched a Brown bear cross the highway at the first chain up area as I was driving East. I and two other cars had to stop for the bear to casually walk across the road from North to South and disappear into the trees. The time of day was early morning, it was light but not sunup yet. The point is that the Brown bears are already here, or at least one bear is here.

Correspondence: I am definitely opposed to the introduction of Grizzly Bears to the North Cascades. We have put into place so many protections for salmon in our state. This would be a huge step back. And Livestock would be at risk. But most importantly it would be a risk for humans.

People in this area are not used to Grizzly Bear precautions when enjoying hikes or camping. It would take a long time for people to learn the skills of awareness, keeping food away, and carrying Bear Spray. And the learning would come at a steep price of human safety and life. Expecting a population not used to this kind of predator to understand the risks and prevention techniques is not reasonable.

And my last objection has to do with climate change. We are seeing more interactions with wildlife in general due to habitats changing, not to mention development and growth for housing. What would assure us the Grizzlies would stay in 'their' area and not migrate to more urban areas? There is already a risk of the bears migrating from Canada. Why do we need to add more to an eco system that has not had them in decades.

The simple argument that they once lived here is a weak one at best. The grizzly bear is only a "threatened" species. I think if we want to protect them, do conservation and other measures in areas where they already exists. Do not bring them to new places that are not used to dealing with them. Even one human death is not worth that.

Sincerely, [REDACTED]

Correspondence: Do not reintroduce Grizzlies in north Cascades. Just in the past six months there have been 4 grizzly attacks fatal to the humans in North America, more than wolves, cougars and black bears combined. The danger is real.

In Yellowstone there are very expensive efforts every year to kill dozens of "problem" grizzlies. But the park has so many visitors, there are resources to pay for grizzly control, unlike the north Cascades. Statistics showing attacks at less than 1 in a million visitors in Yellowstone are misleading, because Yellowstone attracts most of its visitors who just drive and stay in lodges and hotels in towns such as West Yellowstone or in the park. The statistics for hikers that stay overnight in the forest are closer to one attack per 50,000, more than that of cougars and wolves combined. The north Cascades has far more population and attracts far more hikers and fewer hotel-based visitors. It is the terminus of the Pacific Crest Trail. Thousands of thru-hikers pass through this area with their food laden packs in September, with no room for the extra weight of a gun or supplies of bear spray.

There is no evidence of any ecological benefit of grizzlies here. There are already wolves, cougars and black bears.

Correspondence: I am in support of reintroducing grizzly bears to the North Cascades ecosystem. I teach high school biology, and we focus on the importance of keystone species. We have studied the degradation of ecosystems when those species are removed due to human action, such as removing sea otters from our coastal ecosystem and wolves from Yellowstone. As a keystone species, the grizzly bear needs to be back in the North Cascades as an apex predator controlling elk and other prey, and spreading seeds. The ecosystem evolved with grizzlies playing a critical role.

Additionally, grizzly bears are meaningful to local tribes, and my understanding is they are in support of the reintroduction. I stand with them.

We need to repair the damage Western expansion has caused as we recklessly removed creatures we found inconvenient to our own interests. We need to realize we are PART of the ecosystem, not lords over it.

I am a backpacker, and frankly, I am not at all excited about a possible grizzly encounter, but I can't let my own fear be the reason for the continued degradation of the natural ecosystem.

Sincerely,

██████████

Correspondence: I can understand that some people like the idea of restoring local wildlife that may have been here in the past. In theory this sounds nice. Many of the people who are pushing for this live in urban areas and their lives will not be practically affected. The people who live in rural areas will be affected more. There are also some people in rural areas who don't have livestock or children who are for it. This is also because they are less likely to be affected.

People can say that "there have hardly been any grizzly bear deaths". However, it is not only about deaths of people. It is also the threats to livestock and it is also the potential threat and how that affects people's everyday lives who live in these areas.

For example, if there was a serial killer living somewhere in the Seattle area, then people would know this and have to take daily precautions. They will be on edge every day even though the chance is very small that they would be personally affected.

This is the main problem with the grizzly bear introduction. They can and have maimed and killed people so people going in the woods or doing anything outside have to be aware of this at all times in case they run into one. Everyone with livestock has to be on edge and people going into the wilderness have to be prepared to deal with a lethal threat. People with children have to take extra precautions with having them in the woods etc.

All the other animals in the woods in these areas are in general afraid of humans and don't really pose a threat but grizzly bears can be very aggressive.

So, this will change the every day lives and peace of those who live here. There is no reason that these large aggressive animals cannot be kept far away from civilization and livestock and left in the areas where they have over time naturally migrated to.

Thank you for taking into account the lives of the locals who whose every day lives would be affected by this.

-Rural Resident

Correspondence: I do not support the reintroduction of Grizzly bears into the North Cascades. Humans reintroducing animals does not work. We have seen wolves decimate the deer population in areas where they have been reintroduced. Grizzly bears will only make matters worse. It creates problems for farmers as well. Grizzly bears may have been a part of the ecosystem at one point But that was before the area was so populated. It no longer works. There is no magic way to turn the switch back on and return the ecosystem backward. It will only cause damage to the environment.

Correspondence: I am strongly in support of the proactive reintroduction of Grizzly Bears into the North Cascades Ecosystem. To provide grizzlies and communities with the best chance for coexistence, I support Alternative C, which provides greater flexibility and adaptive management.

I have lived in the Methow Valley for nearly 20 years and have recreated in North Cascades National Park and surrounding national forests since I was a child. Although I recognize the living and recreating amongst grizzly bears will require some changes to my lifestyle, I also recognize that grizzlies are a keystone species and belong here. As a resident near the best habitat for grizzly bear restoration, I know that I have options for where I live in this large and diverse country whereas these bears do not. Our communities value the wildlands just outside our doors. This privilege of living so close to wildlands also comes with the responsibility of allowing wildland to continue to be prime habitat for a wide range of plant and wildlife habitats, including those of species that were hunted to the point of extinction and deserve a place back in their native range.

Correspondence: Please do not reintroduce dangerous grizzly bears to WA again. This puts people, pets and livestock at grave risk. Populations of grazing animals can be controlled by the predators that are already present and by hunting. Putting grizzly bears back in WA will end up getting people hurt and killed. Many people enjoy hiking in the beautiful wild areas that WA has to offer, don't make it less safe for people to live and recreate.

Correspondence: I am deeply concerned about grizzly bear introduction into northern Washington. As an avid outdoor enthusiast, I enjoy hiking, camping and hunting. When being in the wilderness or camping in the north cascades, there is always the concern that wildlife will be encountered. Black bears and mountain lions are the animals that I would be most concerned encountering. Having to worry about encountering a grizzly bear is an entirely new type of concern. The size difference and temperament difference between black bears and grizzly bears is hardly comparable. I feel confident deterring and surviving a black bear encounter if it were to happen. Having to worry and plan for grizzly bear encounters is not something I or any other campers or hikers would like to have to be prepared for. Having to worry if a grizzly bear may come into your camp or tent at night, is much more likely to end poorly than would the same encounter with a black bear. I believe this introduction of grizzly bears will affect all inhabitants of northern Washington and should be avoided. There will be a grizzly bear attack at some point and someone will lose their life.

Trying to monitor the grizzly bears also will be very time consuming and will require constant funding and human resources to constantly monitor. Having to monitor and track the bears is not a natural part of living with bears. The fact that they will constantly have to be monitored and tracked demonstrates that they do not belong being placed in the same areas as humans. There is a reason that many parts of this country don't have grizzly bears, since human to grizzly conflict is not tolerable, and will result in attacks. Black bears, again, are much smaller and less aggressive in nature, and conflicts can much more easily be avoided or have positive outcomes.

The introduced grizzly bears also will still be wild animals and may not stay in the areas we place them or behave in the ways we hope they will. They may move to areas that are too close to residences and towns. Once in these areas, will we then be unable to move them out since they have such a protected status? All of this becomes a burden financially and socially on the residents of northern Washington.

Although it would be nice to think that grizzlies and humans can live peacefully together, that is not the case. Do not introduce grizzly bears into Washington.

Correspondence: These bears have not been here since the 90's. They were eradicated due to their aggressive and violent nature. They kill people. This state is an amazing place for hikers and camping and it is enough to contend with the current bears we have. There is no need to introduce a violent predator back into our state. This is beyond ludicrous to consider.

Correspondence: I support Alternative C: Restoration with Section 10(j) Designation. The proposal would bring up to 25 non-problem grizzly bears into remote areas of the North Cascades over the next decade and manage them as an experimental population.

Alternative C is the best choice for bears and the people who live and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

I am a hiker/backpacker married to a fly-angler. I have hiked numerous trails in the Cabinet-Yaaks over several years and

simply followed common sense precautions. I realize that coastal bears are different, but would also add that my spouse has for years done wilderness trips in AK and one in Kamchatka where "grizzly" bears are common. I backpack each season in the Pasayten where they are reputed to occasionally wander in -- same as in northern parts of Wind Rivers. I have done a little hiking in Denali and Glacier and seen grizzlies--but again, no issues. Neither of us has had dangerous encounters --I recognize it is possible-- but likelihood not high enough to prevent us from recreating in those places. I feel the same about N Cascades-- I would still go but would take more precautions than currently do with black bears (bear spray, etc). I am listing all this not because I am any expert -- and not to suggest complacency---but because I know there is fear out there--I belong to an outdoor rec org and lead trips sometimes--also I volunteer regularly in one of our national parks--so I can tell you people I encounter are irrationally afraid of wild animals, especially bears-- much education needed.

The 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you

Correspondence: I hike in the beautiful North Cascades and, although it is at least a 90-minute drive for me, I visit as often as I can. Whenever I hike in bear country (black or otherwise) I carry bear spray. I have seen a few enormous black bears near Cascade Pass and Sahale Arm and they definitely get one's attention.

Having said all that, I do support the restoration of grizzlies into the North Cascades. They used to be a key component of a very complex ecosystem. They should be again.

I can understand local residents with animals who are rightly concerned about possible predation. I am not sure how to address their concerns but I do feel that we need to be able to live with the grizzlies, as do the people who live in what is still grizzly territory.

Correspondence: I support the reintroduction of grizzlies into the North Cascades. Grizzlies were native to this area prior to being brought to near extinction by humans. They are an important keystone species that will positively impact the North Cascade region's ecosystem, wildlife, and vegetation. Grizzlies help aerate the soil, disperse seeds, and regulate prey species. They also carry great cultural significance for local tribes where they are featured in art and stories.

The North Cascades comprise almost 10,000 square miles of wilderness which has been deemed appropriate for grizzly habitat. Grizzlies coexist with humans elsewhere in the West, and management programs can lessen potential conflicts with surrounding communities, such as farms and ranches. Cooperative efforts between public agencies, local communities, tribes, conservation and outdoor groups can bring about a successful reintroduction.

I commend the NPS for pursuing this restoration plan.

Correspondence: Having the possibility of a grizzly bear encounter go from 0% to a non zero percent is a terrible idea. The psychological suffering of always having to be "on guard" for an aggressive bear isn't what any hiker wants.

"Awareness, to Servheen, means not wearing headphones, oblivious to the world, but rather staying in tune with your surroundings." I want to be relaxed hiking. Not constantly afraid.

Also important to note, inland grizzlies are more aggressive than coastal grizzlies. Are we masochist? Don't reintroduce.

Correspondence: Hello,

I support the "no action" option. I do not support the reintroduction of grizzlies into the north Cascades. I do not believe our local entities will properly manage this population, given that other predator populations are not being properly managed, like cougars. We already see the negative impacts of the improperly managed predator population when looking at the decreased deer population and increased human conflicts. Introducing grizzlies is not a good use of public resources, this money would be better spent managing the wildlife we currently have.

Thank you.

Correspondence: I'm generally very pro environment and pro animal habitat. But I'm very opposed to deliberately reintroducing grizzlies in Washington state. People will be killed, not to mention stock. Hikers eventually will feel shut out of some areas. It just seems crazy. Let grizzlies thrive elsewhere, like Alaska -- where people hike with guns for bear protection. I don't think we need to encourage hikers here to carry guns -- or be bear food.

Correspondence: I do not support the proposal to reintroduce grizzlies to Washington. As someone who lives and hikes in Washington, introduction of grizzlies poses needless risks and will deter people from being able to enjoy the wilderness in this state. Statistics about risk to humans are being misrepresented - you cannot compare the type of use of land in Yellowstone to how people recreate in the North Cascades. The risk to human life will be much higher. There are thousands of people who recreate in the back country in Washington State, in large part due to the fact that you do not have to carry guns on you in order to feel safe while hiking. If implemented, this proposal would discourage back country recreation and would negatively impact quality of life for Washington residents.

Correspondence: I lived in Montana for 40 years. Thirty of those years were spent in Bozeman.

My wife and I backpacked in Yellowstone National Park very frequently, Glacier National Park less often and some mountain ranges outside the National Park system that were known to be grizzly habitat.

We always carried bear spray. We made noise if we saw signs of bear or were hiking on trails in brush.

We always hoisted our food and scented items (eg. toothpaste) on Park Service constructed bear poles provided at the campsites.

We never pitched our tent near our "kitchen" or the bear poles.

We never cooked heavily scented food (eg. bacon).

We saw grizzlies, often at a safe distance, and never had a near- dangerous encounter.

It's just that simple.

We had a wonderful 30 years.

I fully support the maximum reintroduction of Grizzly Bear to the North Cascade National Park.

Correspondence: What? Are you crazy? If one person is killed by a Grizzly or if someone is mauled by one, you all should be charged with murder or attempted murder. There WILL be encounters and these are fearless bears. Whoever is behind this is basically taking away the Parks from the people and handing them over to the Grizzlies. Camping, hiking, and outdoor activities are taken away from the people of Washington State. The parks and wilderness areas will be unsafe and greatly impacted. Whether you are hunting, fishing, hiking, camping, rock climbing, mountain biking, etc., you will always be looking over your shoulder, with very little to protect yourself. Bear spray is not effective in stopping a Mama Grizzly or a hungry Grizzly Bear. A gun probably wouldn't stop them either. This idea is insanity. Keep them in unpopulated distant areas. The black bears are more docile, and I honestly worry more about the mountain lions while hiking.

I love wildlife, but this is like swimming with the Great Whites with chum. The black bears are already moving into the eastside communities, looking for easy prey like pet food, pets, or garbage cans. Their populations grow fast and they spread out because of the competition, endangering the public. They don't have any predators except for a hunter.

I have had a Grizzly encounter in Alaska. My stupid Dad got out of the tour bus to get a picture of a Grizzly Bear. Luckily, he made it back in the bus in time. These bears are huge, fast, determined, and like a out-of-control freight train. A real lesson on how agile, and fast these bears are. You are not going to stop a freight train with bear spray.

There is a reason that this concept was abandoned before. Look at the fatal encounters in Glacier, Yellowstone and Colorado. These bears belong in the Canadian and Alaskan wilderness, away from people. Too late to reintroduce them to Washington

State. Too populated. Whoever is pushing this should move to Canada or Alaska and hang out with the Grizzlies there.

The problem with common sense is that is is not so common.

Correspondence: I am commenting on the Draft Grizzly Bear Restoration Plan EIS, North Cascade Ecosystem.

I wholeheartedly endorse the reintroduction of Grizzly Bears to the North Cascades. In other ecosystems, the reintroduction of top predators resulted in a much healthier, diverse, and resilient ecosystem. Washington State has been without Grizzly Bears for too long, and, given the climate breakdown we are experiencing, their reintroduction would prepare our forests and watersheds for the changes that lie ahead.

I would make two (2) comments on the EIS.

1) ALTERNATIVE B SHOULD BE PREFERRED

Alternative B would classify Grizzly Bears as a threatened species with the existing special rule (50 CFR 17.40(b)) under section 4(d) of the Endangered Species Act (ESA). Alternative C would designate grizzly bears in the US portion of the NCE and surrounding areas as a 10(j) nonessential experimental population. I understand that Alternative C would allow more flexibility in managing the bear populations including lethal removal for predation. However, our experience with wolf recovery, where lethal removal has been proven to be ineffective and, in fact, damaging to the overall recovery effort, tells us that lethal removal - especially in response to livestock predation - is a poor response. It would be more effective to get ranchers to manage their cattle than to manage the grizzlies with lethal removal. I would therefore prefer that Alternative B be the Preferred Alternative.

2) CLIMATE RESILIENCE

The EIS mentions the impacts that climate change might have on Grizzly Bear recovery. But it says nothing about the benefits that the reintroduction of Grizzly Bears would bring to the North Cascade Ecosystem with respect to climate change. Reintroducing top predators to an ecosystem changes the behavior of ungulates and other prey animals. In general, they are less likely to concentrate in easy to reach, resource rich areas and denude the landscape. They tend to disperse. In addition, bears have been shown to be transporters for seeds, spores, and nutrients to higher and more remote reaches of the landscape. I'm sure a biologist could develop a more comprehensive list of the benefits that Grizzly Bears would bring to our forests and watersheds. These benefits result in ecosystem resiliency in the face of climate breakdown, and you should take that into account.

In short, I fully support your plan to reintroduce Grizzly Bears to the North Cascades. I believe it would be a more effective plan if Alternative B were the preferred alternative.

Correspondence: We split our time between our primary residence in Port Townsend and a "grandma home" in Snoqualmie, and highly endorse the plan to restore Grizzlies to the North Cascades Ecosystem. There are numerous ways that humans and wildlife can safely share habitats, and it's more than time for us to yield back space to these magnificent animals that are a key element in the natural habitat.

Correspondence: The only realistic and reasonable alternative is No Action.

I oppose experimental and assisted migration of grizzlies in any numbers into the North Cascades. Grizzly bears are not endangered where their populations are expanding in other states and British Columbia across the border from the North Cascades.

Grizzly bears are not an essential top predator in the present North Cascades ecosystems .

Grizzly bears are not necessary for spreading seeds of plants and trees. Black bears and a multitude of other creatures do this within the present territory.

Grizzly bears, if successfully imported, would artificially and unnaturally upset the present balance as it is evolving and changing without them.

Grizzly bears migrating into the North Cascades on their own, expanding their range, adding to the diversity naturally is the most acceptable choice. "NO ACTION"

Sincerely,

Correspondence: Respectfully,

I do not support the reintroduction of Grizzly Bears into the NCE at this time. I'd like to voice my support for "Option A" at this time.

The State of Washington and the WDFW have shown that they are unable to manage our current predator populations well enough to balance the ungulate predation that they are responsible for. While I do support maintaining historic ecosystems NATURALLY, I don't support taking established, native bears from somewhere else in order to achieve a seemingly arbitrary goal of 25 bears or 200 in 60-100 years. Without detailed discussion of how current and future populations would be managed these plans are incomplete and dangerous.

Thank you for your consideration,

-Concerned lifelong Resident and Outdoorsman

Correspondence: Please, please, I beg you guys, DO NOT bring grizzly bears into North Cascade, where tons of people enjoy the outdoor of camping and hiking.

WA state, especially along cascade on both sides, has tons of population. People, of all background and outdoor experience level, should and would go to the mountains to hike and camp. Introducing grizzly here would cause lots of potential harm to people.

We should encourage city people, especially inner city kids, who generally are in poor social-economic condition, to go out hiking, camping, to enjoy nature to help their growth. As those kids are less likely to have experienced guidance, less likely to obtain the proper knowledge for outdoor, or affordability to the right equipment, any introduction to unnecessary danger is a deterrence for the effort to bring those kids out.

I don't believe people intending to bring grizzly bear back to North Cascade have the intention to discriminate minority/disadvantaged kids, but the net effect would be make less fortunate group people less likely to go out to enjoy nature; and their kids less opportunity to grow into a healthy and nature-loving adults.

Thanks for listening.

Correspondence: Thank you for the opportunity to comment.

Please choose a real no action alternative on this issue.

I have previously written to you on this issue and will only summarize those comments and concerns here.

I was born, grew up, lived and worked in and around the area being considered for importation of grizzly bears for 7 decades. I can confidently say that I have spent far more time in the heart of this area than anyone currently on the team working on this proposal. There is no solid scientific basis to conclude that there ever has been a year around grizzly bear population in the North Cascades and specifically in the proposed plan area. It's a speculative theory only and one that is almost certainly incorrect. Its speculation, not science as should be required for a decision of this magnitude.

To the extent that the bears existed in the area, they lived in the areas occupied by people now and likely occasionally roamed into the high county. We should not be conducting biological experiments in our Wilderness Areas by bringing in these bears.

Well-maintained, sustainable outdoor facilities have a much lower environmental footprint than unsustainable & poorly

maintained facilities. This plan has and will make that maintenance more expensive and the backlog larger by drawing needed funds away thereby increasing the overall environmental impact of existing infrastructure. Outdoor recreation on federal lands has seen explosive growth and become a key driver for the economies of cities and towns surrounding the North Cascades. It needs to be improved to sustainably handle the demand. Community health of the region will be improved if more people get out and enjoy the outdoors. There is a significant negative impact of spending scarce recreation management dollars on a misguided Griz import effort.

Please choose a real no action alternative in this EIS. It would be delightful to see the bears establish a population naturally on their own.

Respectfully submitted

Dear Sir,

Thank you for the opportunity to comment on The North Cascades Grizzly DEIS. I have lived in Washington State for fifty years. During that time, I have frequently visited the Methow valley and surrounding areas especially for hiking, back packing and cross-country skiing. The North Cascades is very important to me. I have been particularly concerned with maintaining a healthy ecosystem for resilient populations of plants and wildlife. The one thing missing from this equation is the grizzly bear. The ecosystem has been out of balance since the 1960's with the extirpation of Grizzly bears from the North Cascades. I support Alternative C in the current DEIS and the use of the 10(j) rule. I also support an essential designation under the 10(j) rule.

With the initial listing of the grizzly bear as threatened in 1975, the species loss continued to decline resulting in an endangered listing five years later. The current situation with the last know sighting of a grizzly bear in 1996 is now over a quarter of a century ago. The only way for the grizzly bear to return to the North Cascades is for active intervention. The current isolation from other grizzly habitat in southern British Columbia and the current very low reproductive rate for grizzly bears makes it highly unlikely for recovery to happen if no action is taken. Indeed since 1982 when the National Recovery plan was approved till the present day there has been de-facto "No Action" towards the recovery of grizzly bears to the North Cascade Ecosystem and we have evidence that there has been no increase in the grizzly bear population. Alternative A is unacceptable.

The North Cascades Ecosystem, with its 9500 square miles, is 97% in public ownership and 3% in private ownership. This Ecosystem provides a truly unique opportunity for successful grizzly bear recovery with a minimum of human conflict. Grizzly bears are primarily omnivores with 90% of their diet coming from vegetable and insect matter. The remaining 10% coming from scavenging and occasionally preying on game animals. The North Cascades Ecosystem provides 100 of the 124 plants species they forage on. The Ecosystem has not had the same resilience with the loss of the grizzly bears. The reintroduction of 3-7 bears per year over a 5 -10 years is very reasonable, as is the goal of an initial population of 25 bears. It is important to have management flexibility in order to achieve a sustaining population of grizzly bears. It is also important for the community be involved in conflict mitigation. There is one caveat, I do not support the issuance of conditional lethal take authorizations to private land owners. These conflicts must be managed with contributions form all parties, but the actual

decision for lethal removal (and the actual removal of the problem bear) must be made by the Federal agencies charged with the recovery efforts not by the private land owner.

As humans we have had a huge impact on the environment. The most recent example is Climate change. We need strong resilient ecosystems more than ever. Grizzly bears have been a part of the North Cascade Ecosystem for thousands of years and must be again. It is through our depredations that they are no longer part of the Ecosystem. They are a necessary component and they deserve to once again be a part of it. Their reintroduction to the Ecosystem would assist in regaining both balance and resilience. For example, the grizzly bears help to spread seeds and aerate alpine meadows. We must actively work at their recovery now or risk losing them forever. I want to visit as well as pass down a landscape to the next generation that includes the grizzly bear, and all native species. In the lower 48 states, the North Cascades Ecosystem is one of the few places left where the grizzly bears can exist. Additionally, we have a responsibility to bring them back as we are culpable in their absence from the ecosystem. Finally, grizzly bears are culturally important to both Washingtonians and tribal people. It is important to me to have grizzly bears return to the North Cascades.

Sincerely

I believe you are causing yourself a lot of problems with the proposed South Unit Release area. It appears from your map that the boundary of this proposed release area is only a few miles from several potential food sources that will attract the bears and create potential human conflict.

The private property Stehekin Valley ranch appears to be only 5-6 miles from the release area and has seasonal horse stable, garden, fruit trees, and in some years chickens and hogs. It seems to me that the released bears are likely to find this food source and have lunch.

In addition, the South Unit Release area is only a couple of miles from the Stehekin River which has late summer/fall kokanee spawning with many of these salmon family carcasses littering the stream bank. It is a much used tourist area with quite a few folks visiting the area. Visitors at that time of year are almost assured of seeing the black bears eating the dead spawned fish early morning and early evening along the river. The grizzly will easily find this food source in my opinion.

Also when I was up there the first week of October, the amount of traffic on the Pacific Crest Trail was still high. On one short day-hike along the trail I saw more than a dozen long distance hikers (all but one couple were single hikers), about 8 day hikers going 2-5 miles and about 15 folks hiking less than a mile or wandering around High Bridge. Since the PCT in this area is only a couple miles from the Release area, I would suggest you are asking for problems with your proposal.

Correspondence: It is imperative to reintroduce the Grizzly to the North Cascades and beyond. As an apex predator, the Grizzly has a specific role to play in the environment, and for too long, humans have interfered in the complex food web. While this reintroduction may cause some human - grizzly conflict, generally the humans are at fault due to poor behavior - this is not the Grizzly's fault. Greater Grizzly and human behavior education and compensation for ranchers who may lose stock are important elements that also need to be considered as part of the greater Grizzly reintroduction process.

Thank you

Re: Request for public comments on proposed Establishment of a Nonessential Experimental Population of Grizzly Bear in the North Cascades Ecosystem, Washington State, 10(j) rule for Take Prohibitions and Exceptions, and Draft Environmental Impact Statement

Submitted via <https://www.regulations.gov> Docket No. FWS-R1-ES-2023-0074; and

<https://parkplanning.nps.gov/commentForm.cfm?documentID=132104>

Dear Superintendent Striker and Director Williams,

Sierra Club fully supports recovery efforts to restore a grizzly bear population in the North Cascades Ecosystem (NCE). Sierra Club has a strong national interest in full recovery of grizzly bears in the lower 48 states, and appreciates the time and effort spent on restoration, and the Biden Administration's willingness to re-establish grizzlies in the North Cascades. The restoration of grizzly bears in the NCE is a key element of the national strategy for grizzly bear recovery, as part of the broader grizzly bear entity that was listed in 1975 under the Endangered Species Act. The federal government must undertake and complete all aspects of this national recovery plan in order to meet its legal obligations for grizzly bear recovery. This overdue and critical effort on the part of NPS and FWS is a step in the right direction in restoring grizzly bears to their rightful place in the NCE.

Sierra Club submits these comments to raise its concerns regarding the lack of adequate take protection provided by the proposed 10(j) rule. Sierra Club strongly supports reintroduction of grizzly bears into the North Cascades Ecosystem, but urges the Fish and Wildlife Service to provide the reintroduced population with take protections and exceptions that will promote, rather than undermine, the conservation of the species, as required by the Endangered Species Act.

The Sierra Club was founded in 1892 and is the nation's oldest grassroots environmental organization. The Sierra Club is incorporated in California, and has more than 3.5 million members and supporters nationwide, with approximately 100,000 members and supporters in Washington state. The organization is dedicated to the protection and preservation of the environment. The Sierra Club's mission is to explore, enjoy and protect the wild places of the earth; to practice and promote the responsible use of the earth's ecosystems and resources; and to educate and enlist humanity to protect and restore the quality of the natural and human environments. The Sierra Club has long worked to ensure that imperiled species such as grizzly bears receive the much-needed protections afforded to them under the Endangered Species Act.

Sierra Club members actively use our public lands in Washington State including the North Cascades National Park Service Complex, the Mt. Baker-Snoqualmie National Forest and the Okanogan-Wenatchee National Forest for wildlife watching, recreation and other pursuits. Sierra Club has a long history of work and engagement in the North Cascades. Sierra Club was integrally involved in the establishment of the North Cascades National Park and all of the wilderness area designations that post-date creation of the park.

Sierra Club has worked for decades to recover grizzly bears in the Rocky Mountains, including working with communities and organizations from Jackson, Wyoming to Polebridge, Montana (adjacent to Glacier National Park) to initiate and implement "bear smart" programs to prevent conflicts between grizzly bears and people and to foster coexistence. Sierra Club financially supported range riders and other methods of preventing conflicts between livestock and grizzly bears, and has long advocated for protection of important grizzly bear habitat to facilitate connectivity between isolated grizzly bear populations in the Northern Rockies, from Yellowstone to the Northern Continental Divide ecosystem. Based on firsthand knowledge, the Club recognizes that recreationists, ranchers, ungulate hunters and others can successfully coexist with grizzly bears on the landscape when the proper tools, regulations, human behavioral changes, and attitudes are in place. Sierra Club urges the NPS and FWS to undertake a restoration effort with this foremost in mind and to ensure that a significant, sustained effort is devoted to public outreach, education and proactive conflict prevention measures as part of the reintroduction effort, and to collaborate with non-governmental organizations and others in those endeavors.

Grizzly bears once roamed the NCE in significant numbers, but a confirmed sighting has not occurred since 1996, indicating the species is likely functionally extirpated from the region. As a result, the NCE is no longer as wild as it once was, and the key ecological functions that grizzly bears provided in the past as a keystone species have been lost. As demonstrated in public comment in the last round of the public process to reintroduce grizzly bears to the NCE, the vast majority of people are seeking renewed connections to the great bear and believe that grizzly bears belong in the North Cascades once again. The persecution of grizzly bears to the point of extirpation in the NCE, and to near extinction throughout the lower 48, is a sad chapter in this country's history. This restoration effort can begin to right that wrong in the NCE.

There should absolutely be a strong and vibrant grizzly bear population in the NCE. At 9,800 square miles, the NCE grizzly bear recovery area is larger than even the Yellowstone recovery area, home to an estimated 1,000 grizzly bears. Public lands comprise 93 percent of the NCE recovery area, of which approximately 85% are federal lands. More than two million acres

of designated wilderness on the Mt. Baker-Snoqualmie and Okanogan-Wenatchee National Forests surround the North Cascades National Park Service Complex. As such, this is a vast and still wild area, and grizzly bears belong there as an important native keystone species.

However, every effort must be made by the FWS to ensure that bears taken from their native ecosystems for the NCE restoration effort will be protected to the greatest extent. As described in the Draft EIS, bears considered for this restoration effort will be healthy, young, primarily female bears, likely from the NCDE population in Montana, with no history of conflicts. As such, the FWS must not set these relocated bears, and their offspring, up for failure and mortality, through weak sideboards in a 10(j) Rule.

As currently written, the proposed 10(j) rule is far too permissible in allowing grizzly bears to be injured and/or killed. The proposed 10(j) rule must be significantly revised to assure adequate protection for grizzly bears and to encourage property owners and others to adopt proactive conflict prevention measures. Specifically, the proposed 10(j) rule should be revised as follows:

- Lethal removal of a grizzly bear should only be considered where there is a demonstrable threat to human safety, and, for non-immediate threats to human safety, only after non-lethal management options, including concerted use of conflict prevention methods, have been exhausted.
- Any authorization of incidental taking should apply only to taking that is the result of non-negligent acts, which should be defined to require the exercise of due care to avoid the taking, as well as due care in the act more broadly.
- Deterrence should be limited to noninjurious hazing that does not result in any bodily injury or physical injury to the bear.
- No grizzly bears should be hazed or relocated as a result of conflict with livestock unless demonstrable, repeated efforts have been made by the livestock producer to prevent such conflicts, using commonly-available techniques.
- No grizzly bears should be killed on public lands as a result of livestock depredation.
- Landowners/private citizens should not be given a permit, or otherwise authorized, to kill a grizzly bear.
- No grizzly bear should be preemptively relocated if the bear is not a threat to human safety, particularly if the bear has not become habituated or food-conditioned, or when nonnatural foods/attractants have not been properly secured and made inaccessible to bears. Doing so acts as a disincentive for communities to employ conflict prevention measures, and increases the risk to the bear of injury or death from capture and relocation.
- Baited foot snares should not be used to capture bears intended for reintroduction to the NCE.

Further, as detailed below, the proposed 10(j) rule management provisions and supporting draft EIS fail to meet requirements imposed by the Endangered Species Act, National Environmental Policy Act, and Administrative Procedure Act.

Legal Background

Endangered Species Act ("ESA") Requirements

Prior to designating an experimental population, the Secretary must make two specific findings, *United States v. McKittrick*, 142 F.3d 1170, 1176 (9th Cir. 1998), the first of which is that an experimental population may only be released if the Secretary finds the release will "further the conservation of [the] species." 16 U.S.C. § 1539(j)(2)(A). Factors that must be considered by the Secretary in making this finding include:

- (1) Any possible adverse effects on extant populations of a species as a result of removal of individuals, eggs, or propagules for introduction elsewhere;
- (2) The likelihood that any such experimental population will become established and survive in the foreseeable future;
- (3) The relative effects that establishment of an experimental population will have on the recovery of the species; and
- (4) The extent to which the introduced population may be affected by existing or anticipated Federal or State actions or private activities within or adjacent to the experimental population area.

50 C.F.R. § 17.81(b). The Secretary is required to make this determination using the best scientific and commercial data available. *Id.* The requirement to use the best available scientific and commercial data available "is to ensure that the ESA not be implemented haphazardly, on the basis of speculation or surmise." *Bennett v. Spear*, 520 U.S. 154, 176 (1997) (discussing requirement in context of section 7(a)(2) consultation). While the Service "can draw conclusions based on less than conclusive scientific evidence, it cannot base its conclusions on no evidence." *Pac. Coast Fed'n of Fishermen's Associations v. U.S. Bureau of Reclamation*, 426 F.3d 1082, 1094-95 (9th Cir. 2005) (citing *Nat'l Ass'n. of Home Builders v. Norton*, 340 F.3d 835, 847 (9th Cir. 2003).

"Conservation," also referred to as "recovery," is at the heart of the ESA. Conservation is defined as "the use of all methods and procedures which are necessary to bring any endangered species or threatened species to the point at which the measures provided [by the ESA] are no longer necessary." *Sierra Club v. United States Fish & Wildlife Serv.*, 245 F.3d at 438 (citing 16 U.S.C. § 1532(3)). It is the "process that stops or reverses the decline of a species and neutralizes threats to its existence." *Ctr. for Biological Diversity v. Kempthorne*, 607 F. Supp. 2d 1078, 1088 (D. Ariz. 2009) (quoting *Defenders of Wildlife v. Babbitt*, 130 F. Supp. 2d 121, 131 (D.D.C. 2001)). The ESA's conservation purpose "is reflected not only in the stated policies of the Act, but in literally every section of the statute." *Babbitt v. Sweet Home Chapter of Cmities. for a Great Or.*, 515 U.S. 687, 699 (1995) (quoting *Hill*, 437 U.S. at 184); see also *Red Wolf Coal. v. United States Fish & Wildlife Serv.*, 210 F. Supp. 3d 796, 803 (E.D.N.C. 2016).

As with the other provisions of the ESA, conservation and recovery are at the heart of Section 10(j). *Ctr. for Biological Diversity v. Jewell*, No. CV-16-00094-TUC-JGZ, 2018 WL 1586651, at *5 (D. Ariz. Mar. 31, 2018). Congress enacted Section 10(j) in 1982 as a means of giving greater administrative flexibility to the Secretary in managing reintroduced species. Congress believed that this flexibility would facilitate the reintroduction effort and enhance recovery efforts. See H.R. Rep. No. 97-567, at 33 (1982), reprinted in 1982 U.S.C.C.A.N. 2807, 2833; 49 Fed. Reg. at 33,887-88; *McKittrick*, 142 F.3d at 1174 (management flexibility afforded under Section 10(j) "allows the Secretary to better conserve and recover endangered species"). The use of Section 10(j) was accordingly limited to "those instances where the involved parties are reluctant to accept the reintroduction of an endangered or threatened species without the opportunity to exercise greater management flexibility on the introduced population." 49 Fed. Reg. at 33,888-89. "Even in such cases, the experimental designation would only be applied when 'necessitated by the conservation and recovery needs of a listed species,' and an experimental designation based on nonconservation purposes would not be supported." *Ctr. for Biological Diversity v. Jewell*, No. CV-16-00094-TUC-JGZ, 2018 WL 1586651, at *5 (D. Ariz. Mar. 31, 2018) (quoting at 49 Fed. Reg. at 33,889).

"There is no indication that the management flexibility afforded to the agency under Section 10(j) was intended to displace the ESA's broader conservation purpose, or that it overrides the duty to use the best available science. On the contrary, it is clear from the legislative history that the management flexibility afforded under Section 10(j) 'allows the Secretary to better conserve and recover endangered species.'" *Id.* at *16 (quoting *McKittrick*, 142 F.3d at 1174.). "[A]ny effort to make the recovery effort more effective must be accomplished without undermining the scientific integrity of the agency's findings and without subverting the statutory mandate to further recovery." *Id.*

National Environmental Policy Act ("NEPA") Requirements

NEPA requires agencies to take a "hard look" at the effects of the proposed action. *Bark v. United States Forest Serv.*, 958 F.3d 865, 868 (9th Cir. 2020). An agency takes a "hard look" and properly considers impacts by including some "quantified or detailed information." *Ctr. for Cmty. Action & Env't Just. v. FAA*, 61 F.4th 633, 644 (9th Cir. 2023) (quoting *Bark v. U.S. Forest Serv.*, 958 F.3d at 872). "General statements about possible effects and some risk do not constitute a hard look absent a justification regarding why more definitive information could not be provided." *Bark*, 958 F.3d at 872; *Or. Natural Res. Council Fund v. Brong*, 492 F.3d 1120, 1133 (9th Cir.2007). A "'hard look' should involve a discussion of adverse impacts that does not improperly minimize negative side effects." *N. Alaska Envtl. Ctr. v. Kempthorne*, 457 F.3d 969, 975 (9th Cir.2006) (internal quotation marks and citations omitted).

NEPA requires consideration of all effects or impacts, which are "changes to the human environment from the proposed action or alternatives that are reasonably foreseeable and include...direct effects, which are caused by the action and occur at the same time and place...indirect effects, which are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable...and cumulative effects, which are effects on the environment that result from the incremental effects of the action when added to the effects of other past, present, and reasonably foreseeable actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions." 40 C.F.R § 1508.1(g) (effective May 20, 2022) (emphasis added). "Indirect effects may include growth inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural systems, including ecosystems." *Id.* §1508.1(g)(2). "Cumulative effects can result from individually minor but collectively significant actions taking place over a period of time." *Id.* §1508.1(g)(3). "Effects include ecological (such as the effects on natural resources and on the components, structures, and functioning of affected ecosystems), aesthetic, historic, cultural, economic, social, or health, whether direct, indirect, or cumulative. Effects may also include those resulting from actions which may have both beneficial and detrimental effects, even if on

balance the agency believes that the effects will be beneficial." Id. § 1508.1(g)(4).

"[T]he alternatives analysis section is the heart of the environmental impact statement." Ilio'ulaokalani Coal. v. Rumsfeld, 464 F.3d 1083, 1095 (9th Cir. 2006) (quoting Friends of Se.'s Future v. Morrison, 153 F.3d 1059, 1065 (9th Cir. 1998)). The failure to meaningfully compare alternatives is itself a significant error. Se. Alaska Conservation Council v. United States Forest Serv., 468 F. Supp. 3d 1148, 1152 (D. Alaska 2020).

Administrative Procedure Act

Judicial review of agency actions under the Endangered Species Act and the National Environmental Policy Act is governed by the Administrative Procedure Act (APA). Native Ecosystems Council v. Dombeck, 304 F.3d 886, 891 (9th Cir. 2002). Under APA Section 706(2), the court may set aside agency action where it is found to be arbitrary, capricious, an abuse of discretion or otherwise not in accordance with applicable law. 5 U.S.C. § 706(2)(A). "Normally, an agency rule would be arbitrary and capricious if the agency has relied on factors which Congress has not intended it to consider, entirely failed to consider an important aspect of the problem, offered an explanation for its decision that runs counter to the evidence before the agency, or is so implausible that it could not be ascribed to a difference in view or the product of agency expertise." Motor Vehicle Mfrs. Ass'n of United States, Inc. v. State Farm Mut. Auto. Ins. Co., 463 U.S. 29, 43 (1983).

I. Neither the Preamble to the Proposed 10(j) Rule Nor the Draft Environmental Impact Statement Provide a Meaningful Analysis of How Much More Lethal Take Will Result Under the 10(j) Take Provisions Compared to the 4(d) Rule

The draft EIS fails to take a hard look at how much lethal take of grizzly bears will occur under the proposed 10(j) rule provisions (Alternative C) compared to management under the 4(d) rule (Alternative B). The draft EIS provides only cursory and conclusory statements unsupported by any citation or facts. The only apparent analysis of this important question occurs on page 72, where the draft EIS states:

To foster additional social tolerance for restoration, the 10(j) designation allows for management of grizzly bears not allowed under alternative B. These management tools include conditioned lethal take in management zones 2 and 3. Additional grizzly bear mortality is anticipated under alternative C compared to alternative B in these management zones; however, the amount of additional mortality is difficult to quantify because it is likely that some conflict situations under alternative B would eventually escalate to the point that lethal take would be necessary and implemented by agency personnel. Escalation of conflict situations without the management tools to adequately address grizzly bears involved in conflict is likely to erode social tolerance for grizzly bear restoration among some groups. Therefore, despite allowing lethal take in limited circumstances, the 10(j) designation are expected to improve social tolerance of grizzly bears and, in turn, improve the chances of establishing and maintaining a grizzly bear population in NCE.

Thus, the draft EIS concedes that "additional grizzly bear mortality" is anticipated under the proposed 10(j) rule's provisions, but then rather than estimating the extent of that additional mortality, asserts that the amount is "difficult to quantify" because some lethal take could occur under the 4(d) provisions if situations "escalate" and that allowing more lethal take under the 10(j) provisions would improve "social tolerance"--ostensibly because the lethal take will occur before any "escalation" that would "erode" social tolerance. The draft EIS then offers the conclusory assertion that the improved "social tolerance" will somehow improve the success of the population, without any examination of whether the amount of additional lethal take will outpace any purported benefits from "social tolerance." Those conclusions in the draft EIS are devoid of any factual support or citation to scientific or commercial data whatsoever. The implication seems to be that allowing more legal killing will deter illegal killing, but there is no factual support offered for that implicit assumption. The preamble to the proposed 10(j) rule is also devoid of any such facts or analysis.

The draft EIS also misrepresents the differences between the 10(j) rule provisions and the 4(d) rule by describing the 4(d) rule inaccurately. Specifically, the draft EIS states that under the 4(d) rule: "A grizzly bear constituting a demonstrable threat to human safety or to lawfully present livestock, guard dogs, crops, beehives, or other personal property, may be taken, up to and including lethal removal[.]" DEIS at 34. But the actual text of the 4(d) makes clear that with regard to situations where there is no threat to human safety, lethal take is only authorized under a much narrower scope of circumstances, where there is: "significant depredations to lawfully present livestock, crops, or beehives." 50 C.F.R. § 17.40(b)(i)(C) (emphasis). Thus, it is not just any threat to livestock, as the draft EIS states, but rather only "significant depredations" of livestock. Further, the draft EIS incorrectly states that lethal take may occur where there is any threat to "other property," but the actual text of the grizzly 4(d) rule does not include any such broad category, and is expressly limited to "significant" depredations of only three narrow types of property

“livestock, crops, or beehives.” See *id.* Consequently, the draft EIS improperly skews the comparison of alternatives by misrepresenting the 4(d) rule provisions as being less protective than they actually are, thereby diminishing the contrast with the proposed 10(j) provisions, which, *inter alia*, allow a bear to be killed to protect essentially any property--including compost--from a threat that is not even significant. See 88 Fed. Reg. at 67,210.

The draft EIS also inaccurately describes the proposed 10(j) rule in ways that misleadingly make it sound more protective than the actual proposed text of the rule. Specifically, the draft EIS states that unintentional incidental take is not prohibited “provided such take is non-negligent and incidental to an otherwise lawful activity, the take is promptly reported to the FWS, and if the take occurs on national forest lands, that the USFS has maintained its “no net loss of core” approach and implemented food storage restrictions throughout management zone 1.” DEIS at 38. But the actual text of the proposed 10(j) rule does not impose any such broad limitation to ensure that only “non-negligent” unintentional incidental take is allowed. See 88 Fed. Reg. at 67220-21 (proposed rule 50 C.F.R. § 17.84(y)(3)(iii)). Instead, the proposed rule only contains a limitation specific to hunting. Thus, the text of the draft EIS describes a more protective rule that would make incidental take lawful only where the take was caused by a non-negligent act (i.e., where due care had been exercised to avoid the take, and where due care has been exercised more generally in the act causing the take), while the actual text of the proposed rule does not provide any such broad protection. Again, the effect is to unlawfully skew the comparison of alternatives by misleadingly making it seem like the difference between the 10(j) provisions and the 4(d) protections is narrower than it actually is based on the text of the respective rules.

In sum, the draft EIS violates NEPA by failing to take a hard look at the amount of additional killing of grizzlies that will occur under the 10(j) rule compared to the 4(d) rule, thereby failing to take a hard look at the negative consequences of the preferred alternative, and also violates NEPA by skewing the comparison of alternatives by misleadingly describing the 10(j) and 4(d) rules in ways that unlawfully minimize the actual gap in protection between the two.

This error is serious because, as described below, in making the required findings for the proposed 10(j) rule, the Service irrationally and baselessly assumes that the reintroduced population will exhibit the same success as other grizzly populations, without considering that those other populations benefit from much more protective take prohibitions under the 4(d) rule compared to the 10(j) rule proposed for the NCE population.

II. The Service's Determination that the Reintroduction Will Further the Conservation of the Species Arbitrarily Relies on the Success of Populations Benefiting from More Stringent Protections than Proposed for the NCE Experimental Population

In making the determinations required pursuant to 16 U.S.C. § 1539(j)(2)(A) and 50 C.F.R. § 17.81(b), the Service relies on the success of other grizzly populations to conclude that the proposed NCE experimental population will similarly succeed. Problematically, in doing so, the Service totally fails to consider that those other grizzly populations long benefited from take protections more stringent than those proposed for the NCE population, particularly with regard to conflict-related and incidental take.

With regard to the findings required pursuant to 16 U.S.C. § 1539(j)(2)(A) and 50 C.F.R. § 17.81(b)(4), the Service rests its conclusion that livestock allotments will not limit the reintroduced population in Management Zone 1 on the assertion that similar practices in GYE and NCDE “are not limiting grizzly bear populations” in those regions. 88 Fed. Reg. at 67207. The Service similarly asserts, “As described in Management Zone 1, these activities pose some risk to grizzly bears, but will not likely preclude grizzly bear presence in Management Zone 2.” *Id.* For Management Zone 3, the Service states: “Grizzly bears may still occupy portions of Management Zone 3, but human activities will limit their presence.” *Id.*

These findings are arbitrary and capricious because the Service has failed to consider that even for Management Zone 1, the proposed 10(j) regulation will provide far less protection to the NCE population than the GYE and NCDE populations have received for many years under the 4(d) rule. Under the proposed 10(j), even in Zone 1, seemingly any “depredation to lawfully present livestock” can result in lethal removal. See 88 Fed. Reg. 67, 219 (proposed definition of “Grizzly bear involved in conflict”); *id.* at 67,221 (proposed 50 C.F.R. § 17.84(y)(3)(vi) (providing for up to lethal removal in Zone 1 for “grizzly bears involved in conflict”). In contrast, under the 4(d) rule, only a “significant” depredation of livestock can precipitate a removal. 50 C.F.R. § 17.40(b)(i)(C). Furthermore, the 4(d) rule broadly protects the GYE and NCDE bears from incidental taking, whereas the proposed 10(j) will provide only extremely limited protection from incidental taking. And the proposed 10(j) provision will allow bears to be subjected to vaguely defined bodily injury in the course of deterrence, whereas the 4(d) rule does not allow for hazing that includes injury; although the deterrence provision bars injury causing death, as detailed below, it plainly creates a risk of death and survival impairment that the Service has failed to evaluate. Moreover, the Service utterly fails to consider that the even more limited

take protection in Zones 2 and 3 will affect the persistence of the population within Zone 1. Many areas within Zone 1 are permeated by areas that are designated as Zone 3. See 88 Fed. Reg. 67,702, Figure 2. Thus, as a practical matter, bears in Zone 1 will be extremely vulnerable to lethal removal when they cross through those patches of Zone 3. The Service's findings thus arbitrarily rely on the GYE and NCDE populations to conclude that the NCE population similarly will not be "limited" by livestock allotments and other land management, without rationally examining the impact of the much less protective take provisions proposed for the NCE population. As discussed above, the Service cannot rationally or lawfully rely on the draft EIS for analysis to assert that the populations will fare similarly despite the different protection provided by the proposed 10(j) rule compared to the 4(d) rule. The discussion in the draft EIS is based purely on speculation and surmise and fails to offer any evidence to support its conjecture. See DEIS at 72. Consequently, it cannot provide the basis in fact required by the requirement to utilize the best available scientific and commercial information. 50 C.F.R. § 17.81(b).

Similarly, in making the findings required pursuant to 16 U.S.C. § 1539(j)(2)(A) and 50 C.F.R. § 17.81(b)(2), the Service arbitrarily concludes that because "in the GYE, NCDE, CYE, and Selkirk Ecosystem, grizzly bear population trends in these ecosystems are stable or increasing, and range extent has continued to expand... we can expect human-caused mortality and direct and indirect effects of human activity for the [experimental population] to be reduced to a level such that these threats would not prevent population growth and stability." 88 Fed. Reg. at 67,205. Again, the Service reaches this conclusion without any meaningful consideration of the reality that the populations in the GYE, NCDE, CYE, and Selkirk Ecosystem benefitted from take protections under the 4(d) rule that are far more protective than the proposed 10(j) rule provisions, particularly with regard to conflict-related and incidental take. For the same reasons discussed above, the Service cannot cure this defect with information from the draft EIS, and the Service has consequently failed to make its findings based on the best available scientific and commercial information. It is plain that the greater amount of lethal removal allowed under the proposed 10(j) rule compared to the 4(d) rule may affect population growth and stability, but the Service has failed to provide any meaningful analysis or evidence regarding this critically important consideration.

As a result of these errors, the proposed 10(j) rule is not supported by findings that lawfully comport with the requirements of 16 U.S.C. § 1539(j)(2)(A) and 50 C.F.R. § 17.81(b).

III. The Preamble Misrepresents the Proposed Rule with Regard to the Scope of Incidental Take Allowed Under the Proposed 10(j) Rule and the Effect of Negligence

In describing the management provisions under the proposed 10(j) rule, the preamble states that "incidental take" must be unintentional and not due to negligent conduct." 88 Fed. Reg. at 67,209. However, as detailed above, the actual text of the proposed 10(j) rule does not impose any such broad limitation to ensure that only non-negligent unintentional incidental take is allowed. See 88 Fed. Reg. at 67,220-21 (proposed rule 50 C.F.R. § 17.84(y)(3)(iii)). Instead, the proposed rule only contains a limitation specific to hunting. Thus, the preamble misleadingly describes a more protective rule that would make incidental take lawful only where the taking was "not due to negligent conduct"--i.e., where due care had been exercised to avoid the take, and where due care has been exercised more generally in the act causing the take--while the actual text of the proposed rule does not provide any such broad protection. The effect is to arbitrarily mislead the public into believing the proposed 10(j) rule is much more protective than it actually is. This error violates the requirements of the APA by undermining the ability of the public to comment on the proposed rule. It also indicates that the Service's decision-making is arbitrary and capricious, in violation of the APA, because the Service is making its decision based on an inaccurate description of the proposed rule.

IV. The Service's Failure to Impose a Prohibition on Incidental Take Resulting from a Lack of Due Care (Negligence) is Arbitrary and Capricious and Inconsistent with the Conservation Purposes of Section 10(j) and the ESA More Broadly

As described above, although the preamble to the 10(j) rule states that incidental take will only be allowed under the 10(j) when it is not the result of negligent conduct, the actual proposed regulation text is devoid of such a requirement. The failure to include such a limitation stands in stark contrast with the regulations that the Service finalized in the 10(j) rule for the Bitterroot experimental population, which allowed incidental taking only where "due care" had been exercised to avoid the taking. 50 C.F.R. § 17.84(l)(5). There is no rational basis to allow incidental take for activities that are being accomplished negligently, without due care to avoid the taking, or without due care more generally--particularly when the Service has recognized the need to limit incidental taking to non-negligent actions.

V. The Proposal to Allow Deterrence Causing Bodily Injury Is Vaguely Defined, Arbitrary, Creates a Risk of Death, and Inconsistent with the Conservation Purposes of Section 10(j) and the ESA More Broadly

The proposed rules authorize deterrence that causes “bodily injury” as long as the injury is not “lasting” and does not “cause...death.” See 88 Fed. Reg. at 67,219-20 (proposed 50 C.F.R. § 17.84(y)(1) (definition of “deterrence”); proposed 50 C.F.R. § 17.84(y)(3)(ii) (allowing deterrence)). The rules fail to define what “lasting bodily injury” means, and ostensibly this might be interpreted to include even an extremely severe injury as long as that injury could heal without permanently maiming the bear. By failing to prohibit bodily injury, or to define “bodily injury” in a manner that makes clear that what is permissible, the proposed rule needlessly creates danger that the public will believe it is broadly permissible to injure bears as long as the injury is not maiming or clearly intended to be fatal, and therefore will be more likely to inflict injuries on bears that may actually impair survival. This failure is arbitrary and capricious and inconsistent with the conservation purposes of the ESA.

Moreover, in the past, with regard to the 10(j) rule for the Bitterroot experimental population, the Service has recognized the need to limit authorized deterrence only to noninjurious harassment that does not cause any bodily injury. See 50 C.F.R. § 17.84(l)(5)(iv); see also 50 CFR 17.84(l) (defining “opportunistic, noninjurious harassment” to exclude any “bodily injury”).

The Service provides no rationale for allowing the public to inflict bodily injury on bears here, and its proposal to do so is arbitrary and capricious, and inconsistent with the conservation purposes of the ESA.

Additionally, the 5-day window for the Service's notification requirement following deterrence that causes injury, see 88 Fed. Reg. 67,221 (proposed 50 C.F.R. § 17.84 (y)(6)(ii)), is arbitrary and capricious, and inconsistent with the conservation purposes of the ESA. The proposed rules required that notice regarding death of a bear be provided within 24 hours, but give five days instead to report an injury. Allowing five days rather than 24 hours to report an injury, when it is highly likely that the public may not be able to distinguish a lethal or survival-impairing injury from an injury causing no “lasting” injury, plainly and needlessly increases the likelihood that an injured bear will die before the Service or other authorities are notified, and could otherwise provide care to prevent death. Notably, in contrast, the 10(j) rules for the Bitterroot experimental population required notification of hazing of a bear within 24 hours, even though the only hazing allowed was “noninjurious.” 50 C.F.R. § 17.84(l)(5)(iv).

VI. The Proposal to Allow Lethal Taking by the Public Is Arbitrary and Inconsistent with the Conservation Purposes of the ESA

In contrast to the protections of the 4(d) rule, which allows lethal taking in response to conflict only where the killing is accomplished by officials, the proposed 10(j) rule would allow the Service to permit members of the public to kill bears based on conflict with livestock or property. Neither the preamble to the proposed rule nor the draft EIS provide any scientific support to demonstrate that this serves any conservation purpose. As detailed above, the Service has failed to provide scientific support for its conclusory assertions regarding “social tolerance.”

Moreover, the Service has failed to provide any explanation of how it will ensure that members of the public, as opposed to officials, accomplish lethal taking in a manner that is actually humane. Although the proposed rules state that the lethal taking must be accomplished “in a humane manner,” there is no mechanism provided in the rules to ensure that members of the public who receive such permits have the proper training to kill the bears in a humane manner. 88 Fed. Reg. at 67,221 (proposed 50 C.F.R. §§ 17.84 (y)(4)(ii)(C) and (5)(ii)(C)).

VII. Allowing Lethal Taking on Public Lands Is Inconsistent with the Conservation Purposes of the ESA

The Service has failed to provide any analysis to explain how lethal take of bears on federal public lands to protect livestock grazing on public lands serves a conservation purpose. The preamble to the proposed rule and draft EIS lack adequate consideration of alternative mechanisms for federal lands that would better take into account the authority that federal land managers have to protect the reintroduced population, better fulfill the conservation purpose of section 10(j), and better align with the duty imposed on such agencies under ESA section 7(a)(1) to further conservation of the species.

VIII. The Proposal to Give the 10(j) Rule Effect Regardless of Whether the Reintroduction Has Occurred Is Unlawful

The Service's proposal to make the 10(j) rule's management provisions effective regardless of whether any reintroduction into

the NCE has occurred yet is inconsistent with ESA section 10(j), and therefore unlawful. Adopting this proposal would also violate the requirements of NEPA because the draft EIS does not evaluate such an alternative. The proposed rule states that even if no reintroduction occurs yet, the 10(j) regulations here would remain in place, and would apply to any bears that migrate into the area, such as bears associated with reintroduction activities undertaken by the Canadian government in British Columbia: "In other words, if we determine to reintroduce bears to the US portion of the NCE with a final 10(j) rule, but we are not able to implement that reintroduction before grizzly bears are reintroduced in the Canadian portion of the NCE and travel into the NEP area any grizzly bears entering the NEP from Canada would still be managed pursuant to the 10(j) rule[.]" 88 Fed. Reg. at 67,208.

Implementation of the management provisions under ESA section 10(j) is premised on the reintroduction of an experimental population. Putting those provisions into effect prior to, and regardless of whether any such reintroduction has occurred yet is inconsistent with ESA section 10(j), which allows take to be regulated under those measures, rather than under the 4(d) rule, only for the purposes of facilitating the reintroduction, and thereby furthering the conservation purposes of the ESA. See, e.g., *Ctr. for Biological Diversity v. Jewell*, No. CV-16-00094-TUC-JGZ, 2018 WL 1586651, at *5 (D. Ariz. Mar. 31, 2018) (citing 49 Fed. Reg. at 33,888-89 to explain that use of 10(j) rule only appropriate to further conservation via reintroduction, not for non-conservation purposes). Cf. DEIS at 49 (acknowledging that use of 10(j) designation improper where no bears would be translocated into the area).

Moreover, the Service cannot lawfully adopt its proposal to put the management provisions into effect with regard to whether any reintroduction has yet occurred because it has not analyzed that alternative in the draft EIS. The draft EIS explicitly rejected analyzing an alternative that would impose a 10(j) rule without a reintroduction, see DEIS at 49, and also did not analyze any alternative where there would be a delay between the application of the proposed 10(j) management measures and the actual reintroduction. Adopting an unexamined alternative would thus violate NEPA.

Conclusion

In summary, Sierra Club strongly supports restoration of grizzly bears to the NCE and recovery of a viable population, as required by the Endangered Species Act. However, such an effort must ensure that healthy, non-conflict bears taken from their native ecosystems and brought to the NCE are given the greatest possible chance of success. If restoration moves forward under a 10 (j) rule, significant improvements to the proposed 10 (j) rule are needed to ensure adequate protections for grizzly bears and to comply with the Endangered Species Act, National Environmental Policy Act, and Administrative Procedure Act.

Correspondence: I fully support grizzly bear restoration efforts in the North Cascades. As a former Washington resident, restoring grizzly population would be long overdue for a keystone predator that has a long awaited return to part of its historic range. With the recent Colorado wolf reintroduction program beginning, it gives me hope another misunderstood species may find its footing in land it was ripped from.

Correspondence: I support restoration of grizzly bears into the North Cascades, and prefer option C.

I am an avid hiker and backcountry users and have made many trips to the North Cascades over the past 40 years. I also own a home on the Chiwawa River near Plain, WA.

The North Cascades ecosystem (NCE) is not complete without grizzlies. We need them to make this incredible place whole again. Numerous studies have shown that the NCE is big enough and wild enough to support a viable population of grizzly bears. Restoring grizzly bears to the NCE is a crucial step in preserving the region's ecological and cultural heritage.

They were hunted, trapped, and poisoned, exterminating them from the landscape. We owe it to them to support their return.

Far from feeling that restoration would pose a threat to me as I live in and enjoy the NCE, knowing that NCE is once again providing a home for grizzlies would be a huge positive.

Correspondence: I fully support restoring grizzly bears in the PNW. I believe it's our responsibility to restore the ecosystems we have destroyed in the past and protect what remains for the future. I also think that grizzly bears are a significant part of indigenous culture, and that their roots should be honored and respected. The US government seized and decimated native land, and recognizing that grizzly bears should be restored is a step toward taking accountability for the irreparable damage caused by colonization and industrialization.

Correspondence: Based on the data that I've seen, the environmental improvement by reintroducing the grizzly is questionable and limited at best. Aeration of roots and spreading seeds can be achieved by other animals and birds.

The downsides are obvious. Tragic human/bear encounters, impact to livestock and encroachment in populated areas will happen over time. Additionally, this will result in more armed back country enthusiasts - which personally does not appeal to me.

If we want our parks to achieve true balance in the ecosystem, let the grizzlies migrate to the N. Cascades without human intervention.

Correspondence: I am writing in support for the restoration of the grizzly bear population in the North Cascades. It is natural habitat for grizzly bears for thousands of years. The environment is interdependent - where grizzly bears thrive, so does clean water, abundant native fish and wildlife populations, and the necessary resources for the health and well-being of our human population.

I support Alternative C: Restoration with Section 10(j) Designation.

Alternative C designation would give communities and land managers additional options for managing bears, including deterrence, relocation, or removal of animals involved in a conflict. These additional tools could offer more safety and certainty for the region, while still providing for the recovery and conservation of the species. This is the best choice for bears and the people who live in and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

The 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please allow back this native species to our state's ecosystems through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage. Thank you for taking the time to keep our North Cascades healthy and wild!

Correspondence: My family is an avid hiking and backpacking one. We have enjoyed many trips in the Copper Creek and Ross lake areas, extending of course into National Forest lands as well. We are 100% supportive of Alternative C:

Restoration with Endangered Species Act Section 10(j) Designation.

Aiming to restore grizzly bears in North Cascades National Park will give people the tools they need to thrive in and around grizzly bear country. Grizzlies belong in the North Cascades, as they enhance the park's ecological integrity and contribute to its wildness.

Just as with efforts focused on saving and restoring salmon, working to return grizzlies to their historic ranges will greatly remediate the ecological disruption we humans caused in the balance of nature and the food chain in the region.

We have backpacked in 'grizzly country' in Yellowstone National Park, and the pleasure and wonder we experienced at seeing repeated evidence of the grizzlies was amazing! Although we never sighted a bear, practicing bear smarts made us even better Leave No Trace visitors.

A restored population of grizzlies will boost the NCNP's appeal and attract nature enthusiasts, scientists, and tourists from around the world. This would provide economic benefits to local communities and support the park's mission to protect park resources in perpetuity.

Alternative C, with the 10(j) rule, addresses safety concerns while protecting the grizzly population. It ensures coexistence between humans and bears.

Please consider the positive ecological and economic benefits and support Alternative C. Restoring grizzly bears will preserve the park's natural heritage and conserve an iconic species for current and future generations.

Thank you for your dedication to our national parks.

Correspondence: I am in favor of reintroduction of Grizzly bears into the North Cascades Ecosystem. I prefer alternative 'C' of the EIS, which enables the protection of reintroduced bears. If bears are to be reintroduced, we need to set the stage for their survival and not allow for the past treatment of bears that led to their near extinction.

In reality the ecosystem of the North Cascades is not complete. It's controlled by human fear of, and over-hunting of, predators. The wilderness is less wild without the natural predators that contribute to the balance of a healthy ecosystem. While farmers and ranchers near and inside the North Cascades, need to protect their livestock from predators, I believe that the priority use of the North Cascades is to protect and preserve wilderness. Farmers and ranchers must implement measures to protect their livestock while contributing to a healthy ecosystem.

Thank you for the opportunity to provide comment. I am a person who enjoys hiking, bike-packing and backpacking in the outdoors. My privilege of enjoying the outdoors is founded on respect for natural ecosystems. Bears deserve their healthy place in the ecosystem of the North Cascades just as humans do.

Correspondence: Dear Superintendent Don Striker and Supervisor Brad Thompson,

I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations. We need those bears as much as the need us to support them!

I support Alternative C: Restoration with Section 10(j) Designation. The proposal would bring up to 25 non-problem grizzly bears into remote areas of the North Cascades over the next decade and manage them as an experimental population.

Alternative C is the (qualified) best choice for bears and the people who live and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities. Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and sometimes respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape. I am really only okay with 10(j) rule if lethal taking of a bear is nearly never invoked. Like literally almost never.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you for taking the time to keep our North Cascades wild!

Sincerely,

Kenmore, Washington

Correspondence: I'm commenting to give my vehement objection to introducing grizzly bears into the North Cascades. Grizzly Bears should have been removed from the Endangered Species list long ago, seeing as their numbers in the Greater Yellowstone Ecosystem is over 1,000 (up from 136 in 1975). With that population, establishing a new bear population makes little sense. The North Cascades currently has a healthy black bear population. Grizzly bears do not enhance the ecosystem in a unique way that would justify their re-introduction. Grizzly bears do, however, harm the ecosystem in multiple ways, each deserving consideration.

To begin, no federal bureaucracy or agency can contain any bear population to a specific area. The bears, once introduced and established, will leave the park boundaries and wander into neighboring valleys and onto farmers' and ranchers' property. These farms and ranches are a boon-- Washington State exported over \$8 billion dollars in Washington-grown or processed agricultural products in 2022. This incredible productivity is not only appealing to humans-- it is a veritable feast for opportunistic grizzly bears. Each and every farm contributes to the food economy in the state, and to the United States as a whole. The security of farms and ranches is a top priority for ensuring a healthy nation. Western Montana has adopted the Bear Smart program which seeks to restrict, control, or eliminate things bears target: garbage, bee hives, and fruit and vegetable gardens. Imagine intentionally restricting food production and bee keeping for the sake of environmentalism!

Introducing grizzly bears will mean introducing more layers of bureaucracy, more restrictions on citizen's liberties, and more tax-payer expense.

Grizzlies not only threaten the food economy in Washington, they are a menace to people. Washington aggressively limits citizen's second amendment right, most recently banning semi-automatic rifles (HB 1240). Semi-automatic rifles are used for both hunting and defense and would be the weapon of choice when protecting self or others from a grizzly bear. Bear spray has its merits but it is not a substitute for a gun. The government's restriction of citizen's rights to bear arms whilst introducing an incredibly aggressive apex-predator displays a malicious disregard towards the people of Washington. Will federal agents gather after each mauling and take the time to honor the lives of victims? Will they say their names?

Correspondence: The landscape and land uses have changed. Land which may have once been suitable is no longer. The increasing number of human v animal conflicts is already on the rise. With 44 grizzly attacks on average per year and increasing, we are setting WA state up for catastrophic failure of its human residents. The wolf population reintroduction still hasn't been resolved properly. Why begin with another complicated and, frankly, ill thought out reintroduction when the first one is still so egregiously unsettled. I'm appalled by the willingness to endanger businesses and lives with this poor plan. I'm opposed.

Correspondence: I love the parks and being outside. I believe it's important we do what we can to protect the natural ecosystem.

As a Washington resident and national park lover, I strongly support the National Park Services preferred Alternative C: Restoration with Endangered Species Act Section 10(j) Designation. This plan will both effectively restore grizzly bears in North Cascades National Park and give people the tools they need to thrive in and around grizzly bear country. Grizzlies belong in the North Cascades, as they enhance the park's ecological integrity and contribute to its wildness.

Grizzly bears play a vital role in maintaining ecosystem balance, cycling nutrients, dispersing seeds, and changing the behavior of species around them. Restoring them would benefit the park and the people who use it.

A restored population of grizzlies will boost the park's appeal and attract nature enthusiasts, scientists, and tourists from around the world. This would provide economic benefits to local communities and support the park's mission to protect park resources in perpetuity.

Alternative C, with the 10(j) rule, addresses safety concerns while protecting the grizzly population. It ensures coexistence between humans and bears.

Please consider the positive ecological and economic benefits and support Alternative C. Restoring grizzly bears will preserve the park's natural heritage and conserve an iconic species for current and future generations.

Thank you for your dedication to our national parks.

Correspondence: I am very concerned with protecting the habitat of our existing populations of wildlife (plant and animal). These populations are already being stressed by human encroachment and climate change - it will be enough of a challenge to protect their future without the addition of more competition seeking limited resources.

I want to see further study of how climate change will impact the resources this environment provides.

I want to see further study how the introduction of the Grizzly Bear will impact the behavior of the currant animal (primarily

Cougar and Black Bear) populations.

It disturbs me that the NPS picks the winners and losers in nature (still riled over the slaughter of goats in Olympic National Park). Can we just provide for the beautiful creatures that we now share our environments with?

Correspondence: Absolutely brown bears should be reintroduced into the area! The reintroduction of natural predators will help aid in overpopulation issues of prey animals such as deer and therefore reduce the risk of issues such as Chronic Wasting Disease. As hunters decline, it is becoming a heavier financial burden to manage the deer population for the state. While reintroducing brown bears may not guarantee help, it certainly will provide ecological benefits that expand far past what the division of fish and wildlife can do.

Correspondence: Grizzlies should absolutely be reintroduced. Human beings are incredibly selfish when it comes to nature. Everytime we go out for a hike or a camping trip, we need to accept the risk that comes with venturing into wild animals homes. They were here before us, and they deserve to come home. And to the people who disagree because they won't feel "as safe", on their nature outings, well, then you didn't go on your outing because you love nature. You went for the photo op. If you actually loved nature, there would be no question in your mind to reintroduce these majestic creatures.

Correspondence: Until five years ago, I was a long time resident of the Southern Sierra Nevada in California, living at approximately 5000 ft. elevation. We didn't have Grizzly bears but we were frequent victims of the next extremely dangerous bear - the Black bear.

I, members of my family, and my neighbors had many encounters with the Black bears dangerous behavior that resulted in destruction. And these encounters are not relegated to only the rural areas but also small towns. One family had their fence torn down more than once, their chicken pen destroyed, and their chickens killed. Several others had dogs killed and horses injured. One of my son's horses was injured so badly by a Black bear that it had to be put down.

In the process of building his log home, a Black bear tore out my son's door and proceeded to cause severe damage inside the house. A close friend kept a freezer, closed and secured with a chain, on their screened-in porch. A Black bear broke into the porch, drug off the freezer, tore off the lid, and spread the contents down their road. These are just a few incidents that show the power of bears - and Grizzly bears are much more powerful and aggressive than Black bears.

Now, as a resident of the mountains of Central Washington, I dread the possibility that Grizzly bears may be reintroduced into the North Cascades. I'm very concerned that my grandchildren may be at risk for bodily harm or death and that my family and neighbors may become victims of these vicious animals.

Please consider the danger, destruction, and fear that bringing Grizzlies to our area will cause. Please do not reintroduce Grizzly bears into the North Cascades ecosystem.
Thank you for reading these comments.

Correspondence: YES - I, and the rest of my family of 5, strongly supports reintroduction of grizzly bears into the North Cascades Ecosystem. We frequently hike/camp there and would be honored if USFW would help bring up population #s of grizzlies and many other T/E species into this area.

Bears were in the PNW well before humans and we should do EVERYTHING we can to help this species survive. It is far less expensive and more likley to be successful to use land that has not been ruined by human development for conservation/wilderness areas than trying to restore/change a damaged or inappropriate area. We are so lucky that the N Cascades ecosystem is already suitable habitat for grizzlies.

Counter-arguments to what some opponents argue:

"The campsite I own/operate may be impacted" - Humans, including campers and residents, are guests in the forest. Most people with even a HS education understand that animals (black bears, coyotes, racoons, etc.) can get into human food supplies when humans are careless. Human litter adversely impacts animals (refer to recent bear in Telluride CO that was so sick due to plastic blocking GI tract that it had to be euthenized) and it will always be our responsibility to not cause such suffering (e.g. by properly stowing our food and garbage and behaving kindly toward animals). All of this is already the case and adding grizzlies to the PNW does not change anything for humans.

"My land may become less valuable" - total speculation; we all take this risk whenever buying property. Just as likley it will go up as a result of the reintroduction of grizzlies as people realize this is a conservation area where people really CARE about being stewards for native flora and fauna. Don't be a greedy human - no one likes or respects that position.

There is really NO DOWNSIDE here.

Correspondence: I strongly support the reintroduction of Grizzly Bears into their former territory of North Cascades National Park.

We have the responsibility to do everything possible to help the population grow, as it continues to remain on the Endangered Spieces List.

Many experienced hikers that go backcountry already know how to adjust their awareness when they hike in Glacier or Yellowstone National Parks.

The concern of private livestock owners should not dictate the the need for improving the range for the bears, as it is our responsibility to help improve bear populations, we must accommodate the bears and coexist.

I support Alternative Plan B.

Correspondence: Indigenous people lived alongside bears for thousands of years. People still live alongside grizzlies in Canada and Alaska.

We know 2 things. Bears are a keystone species and this ecosystems coevolved around their presence. Grizzlies are dangerous. In this time of modern technology, I believe we have what we need to recognize the ecological role of the grizzlies and to minimize the danger they pose to people.

Let's continue to compensate farmers at fair market value for predation, bit let's also help these farmers innovate to meet this environmental challenge. For example, the addition of 1 Llama to a herd of cattle, sheep,or goats will cause the Llama to adopt the herd and serve their protector. Various instruments have been successfully used to ward off animals from wolves to elephants as well. Farmers should be financially aided to deploy these instruments on their land.

The unaddressed challenge beyond this though, is that farmers continue to graze on federal land where these bears will be introduced. Farmers that choose this practice will need to accept that they are sending their livestock into wilderness and understand the risks that come with that. Those who wish to use federal wilderness as a denatured cattle field must understand that this is public land, and if the public chooses to restore this land to full ecological function then they must respect that.

Correspondence: Dear Sir or Madam:

My husband and I oppose the introduction of the Grizzly bear into the North Cascades ecosystem. There is no room for these apex predators in this ecosystem. The current population of Black and Brown bears have established their territories - territories that have already been negatively affected by the spread of human populations further into the rural areas. What happens to the native Black and Brown bears when the Grizzlies are dropped into their territories?

Clearly the Black and Brown bears will be displaced by the Grizzlies, possibly being killed by the stronger, more aggressive Grizzly and/or starved out by competition for prey/food in what once was their territory. And what of the deer, elk, moose, and fish populations? What of the other food sources eaten by bears? The pressure on these animals and food sources will increase many fold. The introduction of the Grizzlies will cause a domino effect of negative impacts on the entire ecosystem.

As a result, Black and Brown bears may be forced into becoming marauders, turning to raiding campsites and/or foraging livestock and domestic fowl to feed their starving bellies. The destruction this will cause to local farmers, ranchers, hikers, campers, and other citizens of the area will in turn lead to destruction of the marauding bears. Just one more sad effect of having been pushed out of their territories by the non-native Grizzlies.

Why do this to the Black and Brown bears and the other members of the current North Cascades ecosystem? Please do not introduce the Grizzly bear into the North Cascades ecosystem.

Thank you for reading these comments - I hope they are taken to heart!

Correspondence: I support Alternative C with the Endangered Species Act Section 10(j) designation. That said, I would like to comment on the process that the National Park Service is pursuing to reintroduce grizzly bears to the North Cascades.

As much as I am a bit terrified of the animal itself, I have a boundless respect and admiration for this magnificent creature and would not want to do anything to lessen its chances for survival.

What distresses me is that outside of the sessions where the locals have a chance to air their concerns and fears (I attended the meeting in Winthrop this year and in Okanogan a few years ago), I see no efforts made to educate the community about grizzly bears. Just having posters around the room with a staff member standing by doesn't readily communicate the facts or clarify misinformation.

Instead, the myths and fears seem to proliferate and get worse. Rolled into that is distrust of the federal government and government employees. The impact statement does call for educating communities, but it needs to be done beforehand not after the fact. It would be helpful if local politicians and the sheriff were on board, but they're not. And the local environmental groups don't have much sway with the old-timers in the valley.

My husband and I live between Winthrop and Mazama in a riparian area that is rich with wildlife--black bears, cougars, moose, mule and whitetail deer, beaver, birds--all frequent and seem to flourish in this area. We dearly love seeing and are grateful for the wildlife here. We have learned to put up an electric fence to keep black bears out of our compost in the garden; I have seen black bears twice while walking our half-mile long driveway out to Highway 20. They go their way and I go mine.

However, when I imagine a grizzly in this scene (lots of chokecherry and serviceberry bushes along our gravel driveway), I feel a riskier edge to the stroll to the mailbox. Personally, I think that heightened awareness is a good thing, but I can also sympathize with the farmers, ranchers and outfitters who don't want their comfort level changed while enjoying and working in the outdoors.

Instead of respecting the wild and safeguarding it, all we humans seem to think about is our own comfort and security. Years ago, I had the great good fortune of being introduced to a series of caves at Carlsbad with a group of search and rescue volunteers. Ron Kerbo was our guide. He sat us down in a huge space and admonished us to treat that cave with the greatest respect and care. Somehow, my fears of crawling around in a tight confined dark space evaporated because suddenly I was in love with that cave. It was a deft and miraculous transformation of fear into love and caring.

I wish the same for the grizzly bear and its reintroduction to the North Cascades.

Correspondence: I am enthusiastically in favor of introducing grizzly bears into the North Cascades. At a time when we are in climate crisis we will see the end of livestock sooner than we think. In 60-100 years no one will be raising cows to be

preyed on. And we can do without methane belching doggies. We may never see those amazing bears, but just knowing that they are out there fills me with joy!

Correspondence: I'm writing to share my concerns about bringing grizzlies into the North Cascades. As someone who loves hiking, backpacking, fishing, and hunting in the area, the idea of grizzlies roaming around is pretty unsettling. I get that grizzly encounters are rare in general, but for hunters, it's a different story.

Studies show that grizzlies, especially during their hyperphagia stage, can follow hunters stealthily, often without being noticed. They're drawn to the carcasses of game like elk, which hunters often target. This behavior has been observed where grizzlies closely trailed hunters, sometimes even before any game was downed. It's a bit spooky to think that a bear could be tailing me and my family without us even realizing it.

Across North America, there were 183 bear attacks between 2000 and 2015, with grizzlies responsible for a significant number of these incidents. On average, 24 deaths were caused by grizzly bears in this period. Although the odds of being attacked by a bear are about one in 2.1 million, which is lower than many other risks, the presence of grizzlies could increase these odds for hunters specifically.

This possibility makes me think twice about bringing my family into the woods. And, honestly, it dampens my enthusiasm for contributing to conservation efforts if it means potentially putting us in harm's way.

Appreciate you taking the time to read my thoughts.

Correspondence: Hello,

I would just like to say that for me, allowing Grizzly Bears to become more prolific in our area would be a mistake. We've had at least 3 instances where Black Bears have been interacting with our homes in the development. The loss of habitat seems to have driven them into our living space. I don't think that the Grizzly's addition to our area would be a good idea.

I know that the deer population in our area has been effected by the loss of habitat too. So the bears have to look somewhere else for their food. I wouldn't like to meet a Black Bear, let alone a Grizzly on a trail, far from help.

Thank you for your consideration

Correspondence: As an avid mountaineer, I have enjoyed recreating in the North Cascades for over 30-years. I have reviewed the 2023 North Cascades Ecosystem Grizzly Bear Restoration Plan / Environmental Impact Statement and support the proposal to restore the grizzly bear to the US portion of the North Cascades Ecosystem. I believe the expected benefits will out-weigh any potential impacts. I look forward to someday traveling through grizzly country in Washington state such as when I have traveled in the past though existing grizzly country in Alaska, Montana and British Columbia.

Correspondence: As a member of Back Country Horsemen of Washington, I am very concerned with the ability to continue to recreate in the North Cascades should a small population of heavily protected grizzly bears be mechanically moved into the region that we recreate in. The DEIS does not sufficiently analyze the impact to recreation or present any options for how trails can be maintained open in the presence of protections implemented to reduce human-grizzly interactions.

1. The Pacific Crest National Scenic Trail runs through the core habitat and has permitted distance hikers of around 10,000. When considering the other trail users in and along the North Cascades Ecosystem (NCE) since this is one of the most populated areas around any bear ecosystem, the use likely exceeds a quarter million visits. However, the DEIS indicates that the use is insignificant. It is very significant and will likely result in many human-bear interactions.
2. The Pacific Northwest National Scenic Trail also runs through the NCE as well as other bear ecosystems to the east, including the Cabinet-Yaak (CYE). The CYE has a more established population of bears but still has resulted with challenges to the very existence of the trail due to the limited number of bears in the CYE (20-40). Opposition to the National Scenic Trail in the recovering bear population area as well as the connecting landscapes between ecosystems has also been expressed by USFWS staff, the same agency putting forth the NCE proposal through which the same trail will pass.
3. Without a more detailed analysis of how to retain the carrying capacity of the trails, trailheads, and campgrounds without resulting in long term or permanent closures, there is no way to effectively review this DEIS.
4. Furthermore, the NPS and USFWS have pointed out that the Canadian counterparts and First Nations are preparing to release grizzly bears in the northern part of the NCE. IF that was the only release point, it would move the core recovery/release area north and away from the more densely human populated areas of Washington State. It also would be in line with Washington State law as well since no bears would be translocated directly into Washington, and there also would be predictability on how many bears are being moved into the entire NCE which overlaps both countries. The BC government has noted that their Recovery Plan is being developed jointly with the USFWS even though this US EIS only addresses the Washington effort.
5. As a trail horse rider in the NCE, I ask that the No Action Alternative be selected. The areas we ride in includes the Mt

Baker Snoqualmie National Forest, the Okanogan Wenatchee National Forest including the Pasayten Wilderness, and the North Cascades National Park. We have many horse camps along the boundary of the NCE. We cannot support either Action Alternative without more substantive analysis on impacts to recreation as well as knowing more on the joint planning with Canadian counterparts.

Correspondence: Hello,

My name is [REDACTED] and I would like to comment on your decision regarding bringing Grizzly bears back to the Cascades. How can this be! If you are so concerned for the environment you should not be bringing Grizzly bears into it. Since when has introducing an apex predator into a unique, beautiful, and productive environment, been helpful? Our state is a lovely place, and it has a lot farms and ranches. As you and I both know, Grizzly bears are apex predators and they will go after any animal. This poses a real threat to farms and ranches, do you want to ruin Washington's economy?

Grizzly bears kill tens of people every year, and the attacks are only becoming more common. In fact, at many national parks there are signs that say "do not take selfies with the bears". Can you honestly say that you think more deadly animals will solve the problem? We have all heard the horror stories of small children, teens, and adults who were mauled by Grizzly bears. Are trying to kill Washingtonians? If you read a news article or a book, that was talking about a government that sent deadly bears upon their people. Then did not allow their citizens to protect themselves against these bears with a gun, that it was their right to have. And then deprived their citizens of meat, and therefore a healthy, strong, and long life. What would you think? It seems that in the name of environment you want to end many peoples lives.

Your [REDACTED]

Correspondence: I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish, and wildlife populations. I have had the opportunity to visit 23 National Parks and dozens of National Forests and Monuments and I consider the preservation of America's wild spaces as one of the most important contributions we can make to future generations. I also had the privilege of spending 7 months exploring the North Cascades while living and working in Seattle.

I support Alternative C: Restoration with Section 10(j) Designation. Alternative C is the best choice for bears and the people who live in and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you for taking the time to keep our North Cascades wild!

Correspondence: After much thought following the public comment hearing on 11/01 I have decided to oppose grizzly bear translocation in the north cascades. As an advocate for wildlife, particularly wolves and bears, I am concerned about the risks to the animals that would be translocated, particularly because they will not have the same protection as bears who have migrated into the north cascades naturally.
At the public comment hearing the local livestock producers were very vocal and implied that they espouse the "shoot shovel and shut up" policy and I would be very disheartened if any wild grizzly were to fall dead at their hands, particularly after being translocated, which can be a stressful and disorienting process for the animal.
I understand and admire the parks service's goal of boosting grizzly numbers and I sympathize. I believe Washington state is a leader in wildlife conservation, the project that I think exemplifies this is the wildlife bridge over I90. In my opinion, the best approach to long term stability of wildlife populations begins with addressing habitat fragmentation. We know that there are a number of grizzly bears in the north cascades already and if we continue to reopen historic migratory corridors we can expect to see bears and other species returning to their native habitat without costly and complicated translocation operations. Thank you for your attention.

Superintendent
North Cascades National Park Service Complex
810 State Route 20
Sedro Woolley, WA 98284

Subject: A recovering grizzly population in the North Cascades needs Endangered Species Act protection -- Draft Grizzly Bear Restoration Plan / Environmental Impact Statement, North Cascades Ecosystem

To Secretary of the Interior Deb Haaland, NPS Director Charles Sams, USFWS Director Martha Williams, North Cascades National Park Service Complex Superintendent Don Striker, and USFWS Deputy State Supervisor Ann Froschauer:

I strongly support the restoration of grizzlies to the North Cascades (and throughout their historic range), and I urge the National Park Service (NPS) and the U.S. Fish and Wildlife Service (USFWS) to conduct the restoration in ways that don't

violate the Wilderness Act or harm the area's wilderness character. Grizzlies belong in the North Cascades, as they enhance the park's ecological integrity and contribute to its wildness, but any restoration must be good for both bears and Wilderness.

Grizzly bears play a vital role in maintaining ecosystem balance, cycling nutrients, dispersing seeds, and changing the behavior of species around them. We have the opportunity to bring back these magnificent animals which were hunted and trapped into extinction during the 1800s and 1900s. The North Cascades Ecosystem is one of the remaining six areas in the lower 48 that has enough remaining habitat to support a viable population of grizzly bears. We have seen that grizzly bears and humans can coexist in the lower 48. Currently there are over 1,000 grizzly bears in each of the Greater Yellowstone and Northern Continental Divide Ecosystems. Restoring them to the North Cascades would benefit the park and the people who use it. A restored population of grizzlies will boost the park's appeal and attract nature enthusiasts, scientists, and tourists from around the world. This would provide economic benefits to local communities and support the park's mission to protect park resources in perpetuity.

"It is horrifying that we have to fight our own government to save the environment."
-- Ansel Adams

Disappointingly, both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness, the placement and use of telemetry installations, and steer clear of heavy-handed management of bears. There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide release sites without the use of helicopters inside Wilderness.

While I fully support recovering a healthy grizzly bear population in the North Cascades of north-central Washington, I oppose the use of a 10(j) rule in the restoration work, which would designate threatened grizzly bears moved to the North Cascades as a "nonessential experimental population." This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection. This is unethical and must not be allowed to happen.

Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest. Grizzly bears in the lower 48 states are threatened, and we don't have extra grizzly bears in the lower 48 states to capture and ship to the North Cascades, only to be killed because they had lost their ESA protections.

A 10(j) rule makes it much easier to kill grizzly bears and treat a grizzly bear population in a way that the USFWS would not treat other grizzly bears in the lower 48 states. A 10(j) rule also allows the USFWS to preclude any habitat protections which are necessary if bears are going to recolonize this landscape and eventually link up with other recovery areas. A 10(j) rule also allows the federal agencies to avoid the normal ESA Section 7 consultation requirements, which otherwise require consultations among the federal agencies (in this case, especially the U.S. Forest Service) to avoid jeopardizing the grizzlies.

For all these reasons, I oppose the use of a 10(j) rule for the proposed grizzly bear restoration work in the North Cascades. Instead, a natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives, thus reducing the need for wilderness-degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

Unfortunately, the USFWS hasn't done the legwork for preparing communities and recreationists for the arrival of grizzly

bears through basic Bear Smart and coexistence measures, which just means that conflicts will be more likely--and the results will inevitably be dead grizzly bears.

Fortunately, the no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the North Cascades. Restoring grizzly bears will secure the park's natural heritage and conserve an iconic species for current and future generations. But the restoration must combine natural recovery with population augmentation under full ESA protections

"A thing is right when it tends to preserve the integrity, stability, and beauty of the biotic community. It is wrong when it tends otherwise."

-- Aldo Leopold

Thank you for your consideration of my comments. Please do NOT add my name to your mailing list. I will learn about future developments on this issue from other sources.

Sincerely,

San Rafael, CA

Correspondence: I am writing in support of Alternative C of the subject EIS. The data and arguments in the EIS are rational. My family and I live adjacent to some of the Forest Service land that will be most effected by the reintroduction. We chose to live close to wilderness and are willing to do what is required to coexist with wildlife. Already, in response to incidents with black bears we have built an electric fence around our beehives, bought a bear-resistant garbage can (which we also keep in the garage), have no bird feeders, etc. - all the best practices for not attracting bears. When we have had incidents with black bears we report them to Home Range Wildlife Research. With the slow rate of reintroduction into such a vast area, it's unlikely that I will even see a grizzly, but I will be prepared and am excited by the prospect.

Correspondence: Hello NPS,

I read thru the draft, it didn't explain why grizzly bears disappeared from Washington State. If we don't know the root cause of this species' decline, what should we expect even if we reintroduce? Since the human activities have increased in the area, and the climate change has made natural resources scarer, how will they survive this time?

Not to mention how dangerous it would be for local communities and outdoor recreational visitors.

Thus I suggest not to take actions to re-introduce the grizzlies but to use the resources to protect what's left to us.

Thanks,

Correspondence: I am not against grizzlies returning to the North Cascades, but I do question the wisdom of artificial reintroduction. The Park and adjacent Pasayten wilderness have been in existence for 55 years now with a lengthy and barrier free border with Canada (which also has extensive parks that abut the border). Why haven't grizzlies reestablished themselves

even though the habitat has been deemed suitable? Why are the populations declining in Canada? It seems to me that there should be definitive answers to these questions before considering reintroduction.

Correspondence: I am firmly against the reintroduction of grizzly bears in the North Cascades in Washington state. I come from a family of hikers and we will no longer feel safe to bring our children to nature knowing there are grizzly bears in the wild. There are enough carnivores to control herbivores populations in the area such as wild cats and coyotes. So I disagree with the statement that the grizzlies would contribute further to the local ecosystem. Furthermore, there are other bear species which might be negatively impacted by the grizzlies.

I hope you take my opinion into consideration and those of other concerned citizens.

Correspondence: Hello -

I am writing to express the fact that I am against any policy or action to haul dangerous grizzly bears into the North Cascade ecosystem. The very idea of doing such a thing is pure, bold nonsense. These are dangerous animals should be left in their current habitat. Mixing bears and humans is just asking for trouble. Leave the bears alone.

Cheers,

[REDACTED] Landowner, farmer, rancher, West Richland, Washington.

Correspondence: I support the plan to restore grizzly bears to the NCE. I am not an avid hiker, but when I do hike in bear country (mostly in MT), I carry bear spray and have an awareness and understanding that I could have an encounter with a grizzly. These are risks I am willing to take when hiking in the wilderness.

Correspondence: My Name is [REDACTED] I am President of the Kittitas Valley Trail Riders, a group of about 45 Horse Back riders who ride many of the hundreds of trails in the Kittitas County area and a bit beyond. I am very concerned about the reintroduction of Grizzly Bears any part of Washington State.

I want you to think about the numbers, numbers tell the story. Montana has 7 people per square mile, Washington state 101 people per square mile. Riding the back country in Washington you see a whole lot of hikers, Mountain Bike Riders and Horse Back riders, it'll be just a matter of time for a chance encounter. Montana is 147,000 Square Miles where as Washington state is 71,000, half the size of Montana, the potential square miles a group of 20 grizzlies will need to roam will be in the neighborhood of 10,000 miles, that is a 7th of the state of Washington. Releasing Grizzlies in areas that are highly fire prone, or that have minimal habitat for Grizzly because of terrain will extend that 10,000 mile range. We had a fire next to the Teanaway Community Forest 5 - 6 years ago, The Jolly Mountain Fire, it drove deer, elk and bears from Jolly mountain down into the Teanaway. For up to 4 years we had multiple sightings of black bear in Teanaway, where we normally see one a year. Black Bear are legally hunted in Teanaway, talking with hunters who had been using game cameras in Teanaway they saw way more Black Bears then before, they told me that the Bears were pushed down from Jolly Mountain due to the fire and that it took several years for their forage to grow back enough to support a population. The Mega Fires that have occurred in the North Cascade areas will push bears into human population areas WHEN THEY OCCUR, because they will with global warming.

I'm not addressing the Ranchers dilemma, because that's a no brainer.

If Grizzlies are introduced it'll be just a matter of when a Human to Grizzly incident happens...

Correspondence: I am very concerned about the introduction of Grizzly bears and what it will mean for outdoor recreation in the Cascades. Given the proximity to Seattle, there are a lot of inexperienced people exploring the outdoors (a great thing for them to appreciate the nature!) and I doubt they would all store their food safely, cook away from their tent when backpacking etc. This is a recipe for a bad encounter. Likewise there are a lot of climbers and other outdoor enthusiasts who will likely try to not carry bear spray or even a bear canister on their big mountain pushes. In addition, there is a lot of brush in the Cascades and travel on overgrown trails or off-trail is common. Together this is a recipe for fatal encounters with grizzly bears. Washington has perhaps the perfect outdoors: wildlife that is not life-threatening, beautiful weather, diverse rugged wild landscape. This is paired with a nearby megacity with many people not having experienced the outdoors before. It's where many people fall in love with it through the unique backpacking experiences, turning them into lifetime nature lovers and wildlife advocates. Introducing grizzlies will make that care-free adventure backpack almost impossible to experience. Especially since you can't rely on everyone behaving appropriately even if you follow the rules exactly, which will endanger both humans and as a result bears. Case in point is the example of the black bear at Cascade pass this year that had obtained food from humans too many times. If that had been a Grizzly there is a high likelihood there would have been a mauling. The cascades, or rather the human population here, are not ready for this. Maybe in a few decades, when responsible outdoors behavior has become more engrained in the culture. I strongly disapprove of introducing any additional Grizzly bears in the Cascades.

Correspondence: I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C: Restoration with Section 10(j) Designation. Alternative C is the best choice for bears and the people

who live in and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you for taking the time to keep our North Cascades wild!

Correspondence: I explore the Cascades every weekend as a climber or hiker. This tends to take me and mostly just one other party member off trail into very remote regions. Given the long approaches and the weight of technical climbing gear, we minimize the gear we bring on each trip down to the grams. There is a sizable community here engaging in these kinds of mountain activities. I am convinced that only several Grizzly bear caused fatalities in Washington would induce climbers to carry both bear spray and a bear canister on big mountain pushes where every gram counts and you are already pushing your physical limits and safety margins (do I leave behind two climbing cams I will definitely need or the bear canister I might not?). Likewise group sizes for these kinds of activities will always remain very small, further increasing the risk of a potentially fatal encounter. This in combination with the high likelihood that bears will learn dangerous behavior from inexperienced hikers or at trailheads (since so many Seattleites are completely new to the outdoors) makes a fatality very likely. I would strongly caution against introducing Grizzly bears to maintain the safety of the outdoors and climbing community and our ability to enjoy this precious piece of wilderness we love so dearly.

Correspondence: As a mountain climber and backcountry skier I've spent many days and nights in the the North Cascades. These activities take me, usually with only a single partner, into remote regions far from any trail at all times of the year. I have concerns about the safety of climbers and their gear in the presence of grizzly bears. Because of the remoteness, off trail travel, and small party sizes, any injuries from an encounter with an aggressive bear, or sustained while trying to escape or evade one, could lead to deaths.

Food storage options are often limited because of the terrain. Unfortunately, many climbers have dialed their equipment margins down to a minimum in order to move fast and far through challenging terrain. Few climbers will be willing to carry bear canisters or bear deterrents in addition to their other equipment. This could lead to bear encounters and the bears learning dangerous behaviors. Honestly, it would probably take at least one deadly encounter with a grizzly before even bear-educated climbers would take a bear canister with them.

Because of the remoteness and the nature of the terrain climbers encounter, any damage to gear caused by a bear looking for food could also lead to a life threatening situation. What gear is taken is essential and climbers travel with few pieces of back up equipment. Gear and food is often left unattended at base camp during summit days. If a bear were to destroy a tent, stove, or sleeping bag while trying to obtain food it could lead to a life threatening situation.

Grizzlies may pose no more of a risk than other animals climbers encounter - I'm not a grizzly expert - I just want decision makers to be aware of the presence and relative vulnerability of climbers in remote regions of the North Cascades. Climbers likely visit every single valley in the Cascades throughout the year and I hope that their presence is taken into account in this decision.

Best,

Correspondence: I live near the Selkirk recovery zone. I work and recreate in the Selkirk recovery zone. A grizzly encounter is unlikely but possible, and poses a significant threat if I was to encounter one in the woods. It is enough to feel the need to carry bear spray as well as a pistol for self defense. I know of a person near Bozeman, Mt who felt it was necessary film an encounter with an aggressive grizzly before shooting it, to prove that the act was in self defense to the authorities, because of the scrutiny he knew he would face from Fish and Wildlife officials. Recently, a hunter was severely mauled near Big Sky, effectively losing his jaw. A couple and their dog were attacked, more than likely in a predatory attack, and killed in Banff National Park, just a few months ago. Glacier National Park has had numerous attacks over the decades.

While the release and population rise will be slow, it will inevitably eventually lead to negative encounters with people like myself who recreate in the North Cascades. I am strongly in support of a no action alternative. Grizzlies are present in Canada and may eventually return to the Cascades on their own. I see no reason to spend millions of federal tax dollars to return a creature which will inevitably lead to attacks and possibly deaths of humans. The management of problem grizzlies, including hazing, tracking, capture, relocation, and dispatching will alone cost a fortune, not to mention the initial costs of the release and monitoring program.

Shooting of grizzlies due to self defense are highly scrutinized. Activities such as camping or climbing will need another level of preparation with grizzlies in the area.

There is not enough scientific evidence to support benefits of restoration of grizzlies to the ecosystem. At the end of the day, it is an opinion that they would be beneficial, and it does not overshadow the negative effects. Grizzly restoration is primarily being pursued by wildlife biologists, who are blinded by the romanticism of returning a large carnivore to their management area. Hikers, skiers, climbers, hunters, and your average outdoorsman does not support Alternative B or C.

Alternative A - No Action is the most beneficial and cost effective option.

Correspondence: Absolutely allow Grizzly Bear population to live within the North Cascades NP.

I think it's a smart idea to restore nature and make sure natural habitats are protected and conserved for species that evolved to live as a keystone species. As humans we need to change our behaviours and live more simply on the planet. Humans must evolve to put other species life as a priority. Not live just for our consumption and comforts. If we have to change being in the Park, we should give space to Grizzly Bears.

Correspondence: Humanity tends to measure our progress through fairly simplistic economic values like growth. We expand & extend our presence into once wild areas, & if we come into contact with an species, & that species interacts with us in ways that arent convenient. Humans, decide to reduce that inconvenience by putting in place management programs, which basically mean, we kill those animals to minimise the risk to humanity. This is the slippery slope that we have embraced for many generations, & it eventually means that those animals die out.

I would ask you, "Why are we destroying this planets biodiversity for our short sighted convenience". Don't our children deserve to see the world's wonderful animals & wildlife, & their children, & their children's children. It takes one generation to say enough! Then put in place ways that we can coexist for now & for the future. It may take more money, it may take making some hard decisions, like lets not bull doze that forest area. But with some care & thought, we can find a way to live together with all of gods creations.

I support alternative C, which would restore Grizzle bears to the north cascades.

Correspondence: I oppose the reintroduction of grizzlies to the North Cascades. I hike there frequently, and would probably have to stop with the reintroduction. The obvious risks are just too great.

Since they are already gone, what's the need for this program? I certainly wouldn't vote to EXTERMINATE any species, but they are gone. The world is full of habitats no longer inhabited by one-time tenants, so this is a natural progression. In the absence, other species have settled into a existence. Introducing a top-line predator will surely have a dramatic impact on them -- is their existence too unimportant to consider? It seems that the goal of impacting an environment should be tilted towards maintaining the status quo, which currently does NOT include grizzlies.

I fully oppose the reintroduction and hope you will table the suggestion.

Thank you.

Correspondence: Based on the Agency's neglect for Public Safety the 'No Action Alternative A' is recommended for the following reasons, including the Agency's violation of federal law and the noncompliance by the National Park Services of its own policies.

(1) Failure to Comply:

Pursuant to Title 40 Chapter V Subchapter A, Part 1502.2(b) which states, "Environmental impact statements shall discuss impacts in proportion to their significance. There shall be only brief discussion of other than significant issues. As in a finding of no significant impact, there should be only enough discussion to show why more study is not warranted."

The draft EIS fails to comply with Code of Federal Regulations Title 40 Chapter V Subchapter A, Part 1502.2(b) insofar as it's noncompliance to proportionately document the risks to public safety. While the classification of the Grizzly is easily identified by laypersons as having dangerous and unpredictable behavior and is well known as the top-of-the-food-chain apex predator, nevertheless the draft EIS fails to discuss the consequences to humans of such dangerous and unpredictable behavior. Moreover, the draft EIS fails to discuss in proportion the well documented significant risks to the public as required by 40 CFR 1502.2(b). While Grizzly attacks have been frequent news headlines for communities located near existing Grizzly recovery zones, this same information is not easily available by heretofore unaffected communities. This is why the

draft EIS is required to inform the communities that are in the crosshairs of these actions proposed by the Lead Agencies, however this has not been done. The safety of the public deserves to be a principal consideration during the draft EIS process when proposing to put apex predators onto public lands. Clearly this is not the case. Instead, impacts to public safety are disproportionately represented, in fact are silent in the draft EIS through omission of relevant information concerning Grizzly attacks on humans. The fact is the draft EIS fails to include the well documented grizzly-to-human conflicts resulting from frequent Grizzly attacks occurring inside and outside existing recovery zones. Existing research shows the majority of human-grizzly bear conflicts occur outside recovery zones, according to the draft EIS Page 60 which states, "Approximately 90% of the recovery zone is in federal, Tribal, or state ownership, with only 10% on private lands (Dood, Atkinson, and Boccadori 2006). However, the majority of human-grizzly bear conflicts and bear mortality occur on private lands, especially as grizzly bears expand their ranges." In other words, while the draft EIS admits to the predominant destination of Grizzlies to private lands, by omission it conceals from the public the tragic consequences of Grizzly attacks on humans, including the frequency of such attacks, proximity to population centers, as well as severity of resulting injuries and deaths. As an example, at the end of my comments is a partial list of recent human deaths and injuries resulting from Grizzly attacks inside a brief 4-month period, and is a partial list because the season for Grizzly activity extends into late November.

(2) Failure to Comply:

Pursuant to Title 40 Chapter V Subchapter A, Part 1502.2(f) which states, "Agencies shall not commit resources prejudicing selection of alternatives before making a final decision."

The draft EIS fails to comply with Code of Federal Regulations Title 40, 1502.2(f) insofar as its repeated failures in a) furnishing accurate information on NCE habitat, b) neglecting to utilize relevant and currently existing documentation, and c) disregarding the adverse impact that Grizzlies will have on other wildlife, including bighorn sheep, Canada lynx, Fishers, and various fish species, some which are currently threatened and have ESA protection, but are still regarded as Grizzly prey. The draft EIS has utilized outdated resources that are prejudicial to the No Action Alternative A. The draft EIS applies multiple false narratives by citing documentation which dates back nearly 60 (sixty) years, consisting of reports on NCE habitat and health of the ecosystem. On other words by omission of present-day information, the Agencies are clearly and intentionally "prejudicing selection of alternatives before making a final decision". This is particularly significant given the growth in human population inside and bordering the proposed recovery zones, as well as the losses of habitat that have occurred over the last 60 years that the draft EIS is silent on.

(3) Failure to Comply:

National Park Service Management Policy language concerning NPS conduct and decision making -

NPS policy at Section 4.4.2.2 of the 2006 Management Policies Manual states:

"The Service [NPS) will strive to restore extirpated native plant and animal species to parks whenever all of the following criteria are met: 2) The species does not, based on an effective management plan, pose a serious threat to the safety of people in parks, park resources, or persons or property within or outside park boundaries."

Further, Section 1.9.1.4 of the 2006 NPS Management Policies manual emphasizes that human life must not be compromised, rendering analysis in the final NCE/EIS a necessity:

"The safety and health of employees, contactors, volunteers, and the public are core Service values. In making

decisions on matters concerning employee safety and health, NPS managers must exercise good judgment and discretion and, above all, keep in mind that the safeguarding of human life must not be compromised. "

(4) Failure to Comply:

The Revised Code of Washington (RCW 77.12.035) unambiguously prohibits transplantation or introduction of grizzly bears into the State, including Federal initiatives:

"The commission shall protect grizzly bears and develop management programs on publicly owned lands that will encourage the natural regeneration of grizzly bears in areas with suitable habitat. Grizzly bears shall not be transplanted or introduced into the State. Only grizzly bears that are native to Washington State may be utilized by the department for management programs. The department is directed to fully participate in all discussions and negotiations with federal and State agencies relating to grizzly bear management and shall fully communicate, support, and implement the policies of this section."

Correspondence: I have lived in the PNW for most of my life and also visited areas with Grizzly bears such as Banff and Yellowstone. I do not support grizzly release into the North Cascade. In grizzly bear areas today, people adjust their activities to avoid being put in a position where they might unsafely encounter a bear. This either means more planning or avoiding the activity all together. We do not need the additional risk or fear near population areas.

Correspondence: Dear National Park Service,

I support reintroducing grizzly bears into the North Cascades ecosystem. Grizzly bears belong in this region since they once occupied it and are of cultural and ecological importance.

Like for all wildlife, people and wildlife can coexist with each other. People need to respect these large predators that once occupied this region for thousands of years. If restoring the population were to occur, the chances of a human seeing a grizzly bear in the National Park would still be low since the North Cascades is a remote wilderness with limited road access.

Large areas of open space are a habitat requirement for a healthy brown bear population. The North Cascades ecosystem is a large open wilderness and is a perfect location to reintroduce grizzly bears.

Sincerely,

Correspondence: As a native apex predator, this reintroduction is necessary and a smart investment for a healthy ecosystem. Health is wealth. The ecosystem services realized will stimulate Washington's' economy, and enrich our local flora and fauna to create a more biodiverse landscape. This is a great proposal. Check out How Wolves Change Rivers via YouTube for a great clip that showcases apex predator influence on ecosystems.

Correspondence: This is the same argument that was used to try to stop the reintroduction of the wolves to Yellowstone NPS. With the wolves the park and wildlife is healthier and thriving.

Now bringing back an apex predator is not without concerns but we need bears and other predators to help keep a healthy wildlife population and bears help spread necessary seeds and even help to lessen to a small degrees the risk of fires.

I understand a small portion of the populations concern but the health of the forests and Washington State need bears. Most of the most vocal opposition is from people who don't want to learn something new.

Am I worried about Bear - human interactions, yes, but is rather have to carry bear spray than continue to watch or forests and wildlife slowly decline into history.

Correspondence: Please do not reintroduce Grizzly bears to the North Cascades Ecosystem. Bears would endanger the lives of human beings who are increasingly enjoying the extraordinary outdoors of the North Cascades. I am not convinced there is any real benefit to the ecosystem to reintroduce the Grizzly. While I am a supporter of wildlife and the environment, there are far more urgent and important ecosystem topics to focus upon that will not endanger human life. While the Grizzly is iconic, why not put more emphasis and money into increasing natural grasslands/wildflowers, for example, so insects can thrive, birds can thrive, rodents can thrive and on up the food chain. The reintroduction of the Northern Leopard Frog in the Potholes area of WA state is a good example. Thank you for asking for comments and thank you for the good work you do every day.

Correspondence: I am 100% in favor of Grizzly Bear restoration in the Pacific Northwest. Restoring keystone species to ecosystems should be an obvious mission for the next century and more. In fact, I'm a bit surprised the mention of Grizzlies as a keystone species is buried on page 276. For me, that is a pivotal argument for restoration. The impact a keystone species has on an ecosystem is tremendous and should be highlighted. We need to build life-ways that are in harmony with natural ecosystems, including spending resources restoring those elements we can that we have had such a negative impact. Nature will re-build itself, but it needs a tiny bit of help from us to nudge it in a more complete direction.

Correspondence: We support the restoration of grizzlies to the North Cascades, and suggest that the restoration be done in ways that don't violate the Wilderness Act and harm the area's wilderness character. This is what would be best for bears and Wilderness.

Both of the action alternatives as they now stand would violate the Wilderness Act. The action alternatives should be modified to avoid helicopter landings and flights in Wilderness. Also please avoid the placement and use of telemetry installations and don't over managem the bears.

There are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that these could be used as release sites and avoid using helicopters.

We are opposed the use of a 10(j) rule for the grizzlies in the restoration work. This would mean grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana would be taken from their homes, dropped into the North Cascades, and lose their previous protection.

Montana doesn't have any "extra" grizzlies to lose to the North Cascades. Montana grizzlies are not yet recovered under the ESA, and any dispersing grizzlies from Glacier or Yellowstone are needed to naturally recover areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. The new information presented by Superintendent Striker regarding the likelihood of naturally migrating bears from Canada suggests active repopulation urgency may be more about protecting agency discretion than protecting Wilderness and creating the best environment for grizzly bears to migrate, live, and thrive.

For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears. Please include these coexistence measures in both of the action alternatives.

Please do all you can to prepare residents and visitors for bears, particularly given the relatively large human population in the region and rapidly increasing recreation pressures in the Park.

Correspondence: Thank you for this opportunity to comment on the: Draft Grizzly Bear Restoration Plan / Environmental Impact Statement for the North Cascades Ecosystem

As a member of Back Country Horsemen of Washington, I am very concerned with the ability to continue to recreate in the North Cascades should a small population of heavily protected grizzly bears be mechanically moved into the region that we recreate in. The DEIS does not sufficiently analyze the impact to recreation or present any options for how trails can be maintained open in the presence of protections implemented to reduce human-grizzly interactions.

As a trail horse rider in the NCE, I ask that the No Action Alternative be selected. The areas we ride in includes the Mt Baker Snoqualmie National Forest, the Okanogan Wenatchee National Forest including the Pasayten Wilderness, and the North Cascades National Park. We have many horse camps along the boundary of the NCE. We cannot support either Action Alternative without more substantive analysis on impacts to recreation as well as knowing more on the joint planning with Canadian counterparts.

BCHW supports Alternative A the No Action Alternative.

Correspondence: I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C: Restoration with Section 10(j) Designation. Alternative C is the best choice for bears and the people who live in and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you for taking the time to keep our North Cascades wild!

Correspondence: The introduction of Grizzly Bears into the North Cascades will without a doubt result in 1-2 deaths on a yearly basis. This makes the outdoors significantly less safe for humans and I believe those who are in favor of this are not the same people who use the outdoor/trail system frequently. Backpackers like myself will now need to carry firearms, be on alert constantly and carry significant bear deterrents to protect themselves.

It's rare to see a public proposal that you know without a doubt will directly result in death in the future. If the government moves forward with this proposal I would like to see those that sponsored it explain to the families of those that are killed that their deaths were worth it to have a more 'full' ecological system.

Choose Life, don't introduce Grizzly Bears to the North Cascades.

Correspondence: My family has lived and ranched in the Kittitas Valley for over 100 years. The problems with predators has escalated to the point that our livelihood is threatened.

The reintroduction of Grizzlies to Washington State would add one more apex predator to an ecosystem already overpopulated.

The Wildlife along with the public would be threatened.

Idaho has had more people attacked by Grizzley's since their introduction in the last few years than ever before. The public are out in the National Parks more and more each year.

What is more important Grizzley's or people??

The grazing of public lands helps with the fires and the ecosystem benefits.

Correspondence: Good morning,

As a mother, hiker, backpacker native to Washington and now raising my family here I support the "no action" option for Grizzly Restoration in the North Cascades. I do NOT support Grizzly Restoration.

My 14 year old son asked me to go backpacking alone with him last summer- an experience I cherish. I would not have the same comfort level backpacking alone with him with increased grizzly encounters.

Our population has grown and changed and re introducing grizzly bears in this region is not taking into account our human impact on the existing ecosystem or the increased probability of grizzly encounters including dangerous encounters.

I live within 10 minutes of downtown Seattle and we have black bears that frequent our neighborhood and live in the adjacent woods. These bears have been impacted by our growing population. We would create further problems by re introducing the grizzly to the North Cascades.

Please do NOT proceed with Grizzly Restoration in the North Cascades.

I support "no action."

Thank you

Correspondence: This is nonsense. Grizzlies are dangerous, why on Earth re-introduce them? Why not in the L.A. area? They used to be there too, no?

I camp, fish, hunt, and bring my children to these woods. Why would you intentionally make it more dangerous for us? What happens when inevitably someone gets killed by a grizzly bear? Regardless of your "very small chance" nonsense, if you bring them back it WILL happen. Statistical inevitability. So when the family of that victim(s) rightfully points out in court that their loved ones would absolutely still be alive without your meddling, what will be the response I wonder?

Make no mistake, anyone involved in this will carry some responsibility for the inevitable and avoidable deaths of people. All just to meddle in things that don't need to be meddled in.

Correspondence: There are several questions that need to be asked (and answered) before making any determinations concerning establishing grizzly bears in the North Cascade Mountains. The most important question is this, What are the grizzly bears supposed to eat in the North Cascades? Is the information true that has been fed to the public about grizzly bears living and roaming in this area? After all, Lewis and Clark never mentioned this particular breed of bear living here--in Eastern Washington, yes, but no mention of them on the West side. We now have no deer living in our mountains because of cougars--the only deer will be found living in someone's backyard--the only safe place to live. Hikers enjoy spending time in our mountains--will they feel safe if grizzly bears are in our mountains (and are known for stalking humans)? Has anyone interviewed a person who has been attacked by a grizzly bear and lived to tell the story? These are the folks to talk to--not the so called environmentalists who have nothing better to do than insist on these questionable practices.

Correspondence: I am a avid hiker and climber. I've summited all the major peaks in the Cascades. I was a Scoutmaster for 35 years with a focus on backpacking and climbing. In 1985 I worked with the USFS and the Seattle Mountaineers to introduce "Leave No Trace" to the Boy Scouts of America.

I typically had 85 boys in my troop at any given time with an average of 60 nights of camping per year, most of it backpacking.

In 1990 I took my troop backpacking on the historic Chilkoot Trail in Alaska and then in the Yukon Territory in Northern Canada where we had an encounter with a grizzly. We educated ourselves prior to our arrival by seeking out subject matter experts. We had no problems with our face to face encounter as we did everything right and the bear departed.

It was made extremely clear to us that as soon as bears learn to associate people with food, encounters will happen. Posting a sign at the trailhead "Grizzly bears ahead" is insufficient. I have observed hundreds if not thousands of unprepared backpackers on the trails. After decades of backpacking it's pretty trivial to take a look at a hiker, his boots, clothes, pack and determine if he's prepared for what's ahead.

The Puget Sound area has had an explosion in population, with the wilderness as part of the attraction. These people didn't grow up here, many didn't even grow up in the US. I have seen soooooo many hikers totally unprepared for rain or snow, on the trail, camping overnight. If we can't prepare hikers for the rain, we can't logically expect to prepare them to be ready for an encounter with a grizzly. And it will only take a few encounters with people before the bear learns about the tasty snacks available for the taking. A 180 lb backpacker is no match for a 600 lb grizzly.

Also of note is that the Chilkoot Trail has an infrastructure to allow backpackers to be safe. There are cinder block buildings with steel doors and bear proof locks where campers can cook and store their food. The Wilderness Act of 1964 prohibits the creation of such buildings. You can be sure there will be grizzlies in Wilderness Areas in the North Cascades.

Finally, I have zero confidence the US Government will properly fund the introduction of grizzlies. INTENSE education is required. The plan doesn't say how this education will take place or how it's funded. A 10X increase of backcountry rangers is required. There is no way the financial resources will be allocated for the next 25 years to deal with bears that need to be destroyed or relocated. Bringing in 25 bears without funding all the other activities that must take place is plainly irresponsible. The plan submitted indicates humans will be able to defend themselves against grizzlies should the need arise. A pistol is going to be useless. Carrying a gun big enough to do any harm and having the skill to use it reduces the ability of a hiker to defend themselves to practically nothing. The plan also says other agencies can take action to relocate or destroy problem bears. But there is no mention of how this is going to be funded. It is irresponsible to bring bears into the area and put the onus on 'other agencies' to deal with the aftermath.

I am opposed to the reintroduction of grizzly bears in the N. Cascades.

Correspondence: I am vehemently against reintroduction of an additional predator to WA State. Is there a lack of predators in WA? Or, perhaps, is WA overrun by unchecked grazers? Why introduce another animal to the ecosystem that will be a problem to humans, when there are much better eco solutions that can be implemented with a much greater impact? For example, why is the reintroduction of the American Chestnut tree is going so slow? But, no, we have to go and put grizzlies in WA! I say no!

Correspondence: Please reintroduce these beautiful and needed animals back into the cascade range. Having lived and hiked and enjoyed Washington for the past 44 years we know you need to respect the wilderness and the animals that live there. The black bears return will make the cascade range even more special knowing you are sharing it with them once again. We can't survive as a single species. Thank you for your efforts in this reintroduction.
Sincerely, the Peltola Family

Correspondence: Bring the bears back. We love them, we need them, a key species is missing from an ecosystem because of humans being awful (classic). Had it not been for our brutality, communities of today would have to coexist with grizzlies. Which many communities in states like Montana and Wyoming already do. It is not ethical nor lines up with Washington's love of the outdoors and her ecosystems to deprive her of a keystone species for the sake of capital.

Grizzly bears > Capital

Correspondence: Hello,
I am strongly opposed to the introduction of Grizzly Bears in The North Cascades of Washington State. Our family enjoys the peace, quiet, and safety that the North Cascades offers our family on outings. Our tax dollars to local, state, and federal entities are given to you by us to be used responsibly. Grizzly Bears are a danger to our family, and we do not consider your introduction of the bears a responsible use of our tax dollars.

I am a member of Back Country Horsemen of Washington. We do considerable trail work for various government agencies. I feel our partnership has been violated with this Grizzly Bear topic. Grizzly Bears are dangerous and should not be allowed in the North Cascades.

Janet Keller

Correspondence: I support "alternative C, the preferred alternative, where the FWS would designate grizzly bears in the US portion of the NCE and surrounding areas as a 10(j) nonessential experimental population (NEP) under section 10 of the ESA. Designation of grizzly bears released into the US portion of the NCE, including their offspring, as a NEP would provide state, federal, and Tribal agencies with greater management flexibility should conflict situations arise. "

As demonstrated for Olympic National Park objectives to attain a prehistoric faunal diversity within the Park boundary by removal of Mountain Goats (*Oreamnos americanus*) from within the ONP it is appropriate that objectives to support the prehistoric faunal diversity within the North Cascades Ecosystem to restore Grizzly Bears to this portion of their historic range.

As demonstrated from recent habitat surveys in NCE there appears to be adequate vegetation diversity and distribution to support viable populations of Grizzly Bears. In addition with climate change and increased probabilities for wildfires and regeneration of early successional forests with shrubby vegetation and berry producing *Ribes* and *Vaccinium* spp. there may be greater opportunities for suitable Grizzly Bears habitat from an increased wildfire regime resulting from climate change. Although historic populations of Grizzly bears in the NCE may have been seasonally supported by anadromous fisheries, as currently occurs in coastal Alaska and British Columbia, Grizzly Bears are not dependent on fishery food source as demonstrated by inland populations throughout North America. Although anadromous fisheries have declined since prehistoric times restored populations of Grizzly Bears will likely not be compromised by the lack of sustainable fisheries food resource. Observation from WDFW field studies of Black Bears on the Olympic Peninsula (G. Koehler 1994, personal observations) Black Bears do not seasonally congregate along salmon spawning streams with current depauperate salmon

populations than occurred historically. However, Black Bears do congregate among seasonal high elevation alpine habitats where Vaccinium species predominant.

Although some publics express concern for human safety and conflicts with Grizzly Bears there is limited evidence to support these concerns. Grizzly Bear populations have increased from estimates of 136 in 1975 to 1,063 in 2021 in the Yellowstone Ecosystem where 3 to 4 million people visit annually. Only one visitor was injured by a Grizzly Bear in 2021 and 4 human fatalities are documented for Montana since 2020. These data suggest that there would be greater threat to public injury and fatalities during vehicle accidents for visitors traveling to YE than during an encounter with a Grizzly Bear.

Correspondence: I think it is a very bad to bring grizzly bears into the North Cascades of Washington. There is no reason to take these bears from a place where they are doing fine and there is plenty of room for them. If people want to see these bears they can travel to where the bears are living. The bears are better off where they have less contact with people, contacts which can be fatal to bears that do what bears sometimes do. Bringing bears to the North Cascades in a goofy idea of selfish people who don't want to go out of their way to see them. It is a totally different thing with wolves, who move back to places on their own, and it very hard to find even one documented case of a wild wolf harming a human.To capture bears and take them against their will to a place where life will not be as good for them because "I want to see grizzly bears in the North Cascades" is WRONG,. SELFISH. Don't do it!

Correspondence: To Whom It May Concern:

I am in favor of reintroducing *Ursus Arctos Horribilis* into the North Cascades Complex. If successful, which it is not a certainty, it would go a long way in restoring the natural balance of those beautiful mountains. Which has been proven in other areas.

If it turns out that too many hikers & backpackers .or others, are threatened hunting permits could be sold to wealthy trophy hunters. They are always looking for a new quarry to pursue and it would recoup the costs if you charged alot. Seems like a win-win situation to me and at least we could say we tried.

Leave No Trace,

Maple Falls, Wa

Correspondence: Thank you for the opportunity to comment.

I support the restoration of grizzlies to the North Cascades as long as restoration is compliant with the Wilderness Act and does not harm the area's wilderness character. Additionally, restoration efforts must minimize human handling of grizzlies and prohibit any harassment of grizzlies.

Regrettably, both of the proposed action alternatives violate the Wilderness Act. Hence, these action alternatives must be modified to 1) prohibit helicopter landings and flights in Wilderness, 2) prohibit the placement and use of telemetry installations, and 3) prohibit heavy-handed management of bears.

Note that there are many roads that bisect or penetrate the recovery area or dead-end next to Wildernesses that could provide

access without the use of helicopters inside Wilderness.

I strongly oppose the use of a 10(j) rule for the grizzlies in the restoration work because it would allow fully protected grizzlies (under the Endangered Species Act [ESA]) to be taken from their homes. This is far too disruptive & violates current protection measures.

This is especially true for the Montana grizzlies: their populations have not yet recovered under the ESA. Likewise, dispersing grizzlies from Glacier or Yellowstone is disruptive; these grizzlies are needed to naturally recover in areas like the Selway-Bitterroot Wilderness and the Nez Perce-Clearwater National Forest.

Relocating grizzlies from one place to another is cruel and unnecessary. They are sentient beings and should be left to repopulate habitats naturally.

A natural recovery alternative must be fully developed and analyzed, even if recovery would take longer than active repopulation. For the long-term success of grizzly restoration, natural recovery measures must be included in both of the proposed action alternatives. This reduces the need for wilderness degrading activities that ultimately harm bears and their habitats.

Natural recovery processes require strong partnerships with British Columbia to 1) ensure that grizzlies have corridors to move back and forth across the international border and 2) prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

The no-action alternative has many good Bear-Smart components on how people and communities can coexist with grizzly bears; these coexistence measures should be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Thank you for considering these comments.

Correspondence: Dear Superintendent Don Striker and Supervisor Brad Thompson,

I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

Any effort we can do to combat the current climate crisis and restore the natural balance of the ecosystems is extremely important! People must be able to live harmoniously with all animals if we are to create a sustainable living situation for ourselves.

I support Alternative C: Restoration with Section 10(j) Designation. The proposal would bring up to 25 non-problem grizzly bears into remote areas of the North Cascades over the next decade and manage them as an experimental population.

Alternative C is the best choice for bears and the people who live and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities. Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and sometimes respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you for taking the time to keep our North Cascades wild!

Sincerely,

██████████

Correspondence: I appreciate the goal of restoring habitat for an endangered species and re-establishing natural ecosystems but, as an avid user of these lands for recreation (mountaineering, hiking, camping, etc.) and with a strong desire to bring my young family into these special places in the coming years, this proposal would put me and my loved ones at risk. We can recreate in these areas today without significant fear of predators and without all of the precautions required to mitigate their risk. I therefore request alternative A - no action.

Correspondence: I have spent a lifetime in the mountains and love them and the wildlife there. I have hiked tens of thousands of miles in the backcountry. That being said, there are better ideas than this plan. We are long past the time when this would work. Civilization has progressed much too far for there not to be conflicts that will lead to these animals being killed. That expensive and unpopular result will come from this poorly thought-out idea. The concept comes from people who do not understand nature. It will also lead to far more people being armed in the forests, which is never necessary. The last thing we need is more people in the wild areas with more and more guns, which will make it far less safe for all of us. Do you want to see thousands of more people with assault rifles everywhere in the mountains on hikes? If you do this, you will, I assure you. Please do not do this ill-conceived plan.

Correspondence: To whom it may concern: I go by Bill. I am 85 years old. I have been a wildlife enthusiast all of my life. I am deeply concerned in about the proposed re-introduction of Grizzly bears into the North Cascade wilderness in Washington State. I have checked recently with the wildlife department of British Columbia and asked for the population of Grizzlies in that province. They gave me the estimate of 16,000 animals. It is my belief that if these British Columbia bears, the same sub-species once found the North Cascade Wilderness, found this area to be habitable over the last 200 years, they would have found their way by now.

I am totally agensnt any form of re-introduction program you suggested. We the people have previously spoken!! We have better wildlife projects to spend the tax payers dollars on.

Thank You

I am writing in support of reintroduction of the Grizzly to the North Cascades. As a Washington native, an avid hiker and an educator of 33 years within the public school system teaching AP Environmental Science I am compelled to comment in favor of the reintroduction plan. This beautiful animal historically lived throughout Washington and was critical to the balance of the ecosystem. Due to many challenges, the grizzly has become increasingly isolated from others of the species making breeding and "natural" recovery of their numbers remote, if not impossible. The Grizzly is for the most part a solitary and shy animal that avoids human interaction. Reintroduction of Grizzly Bears from different regions would increase genetic diversity within the species, which would be especially important when the numbers of Grizzly Bear are critically low now. The North Cascades offers some of the best habitat for a successful reintroduction of this iconic animal! The reintroduction plan includes collaring and monitoring the bears, which should offset opposition to the reintroduction plan. We are stewards of this land and its inhabitants - learning to coexist with as many species as possible is both rewarding and our responsibility. Successful reintroduction of the Grizzly Bear in the North Cascades would enrich the culture of our state, increase biodiversity and be a step forward in managing our state lands considering what is available for future generations to experience. We have seen firsthand how reintroduction of *Canis lupus* has brought Yellowstone National Park back in balance; this is another chance to witness the recovery of a species and the associated return to full health of the ecosystem they belong in.

I wrote in support of the reintroduction of the Grizzly to the North Cascades in February 2017, July 2019 - this discussion has been going on for years - please move forward with reintroduction NOW!

Respectfully submitted,

Correspondence: My summer home is located 4 miles north of Concrete, Washington in a wooded area where we have seen wildlife including some cougars and black bears as well as deer and coyotes.

We have managed to live with these animals, but grizzlies are a different story. They are a more aggressive animal and threatening to our welfare and the enjoyment of our surroundings, including hiking trails, rivers and lakes.

I ask you, just because grizzlies might have existed there in the past, why is it necessary to bring them back to an increasingly human population that enjoys recreational activities and living in a wooded and forested environment.

It is also a threat to the farmers in the area who provide food for our population. There are not that many open spaces as our human population grows. Are bears more important than our welfare and livelihood? There are plenty of other places to consider. I hope that you will listen to and not ignore our concerns and comments.

Government tends not to listen to concerns and must be more transparent to the public.

I look forward to your public comments addressing our issues and concerns. Don't wait until something bad happens like the recent Grizzly attack in Canada. We are fearful.

Correspondence: We strongly support reintroduction of grizzly bears into northern Washington Wilderness lands. Your carefully-crafted plan, well-vetted by state residents is a key component of comprehensive environmental restoration. Such long-term efforts cannot be successful until and unless apex predators are present in relevant numbers. Please do not allow private parties (especially those raising livestock on public land) to thwart this effort. Nor should this program be adversely impacted by hypocritical reactions from hikers claiming their enjoyment of the terrain in question would suffer from the presence of ursus arctos horribilis. Please proceed with this long-overdue, carefully implemented plan.

Correspondence: It is NOT a good idea to re-introduce a predatory species into an environment where this predatory species has been eliminated a very long time ago.

Especially at a time when almost every citizen is completely overwhelmed with problems and overstressed - it is so important to have safe places in nature to be able to recover, "recharge" and breathe freely - without the fear of being attacked and mauled by a bear.

It happens again and again that bears attack and kill people:

In May 2021, a Colorado woman, walking her dog in the afternoon, was mauled and killed by a female bear and her two cubs.

In October 2022, a woman near a park in downtown Leavenworth, on the east slopes of the Cascades, was injured by a bear. And multiple hikers and campers have been killed by bears in recent years.

No - we truly don't need grizzlies reintroduced in the Cascades - this is totally inappropriate.
Absolutely No!

Correspondence: As a regular backcountry visitor to the Cascades (20+ days/year), I strongly oppose reintroduction of grizzlies into the area. Having traveled extensively through bear area and having encountered grizzlies before, I find it absurd that we would purposely increase risk to human life for any reason. Anyone with grizzly experience knows how ridiculous advice like be "bear aware" or "carry bear spray" is with respect to grizzlies. Two experienced hikers were just killed near Banff with empty bear spray cans found next to them. I carry a shotgun when traveling in Alaska bear country knowing even that barely increases my odds. Just look north to BC to see the people of Pemberton terrorized by grizzlies bluff charging children! My sense is that the overwhelming view of those that are even aware of this project do not support it. How can the federal government foist this upon us? I hope you will take the pleading to cancel this project seriously. Thank you.

Correspondence: The reintroduction of Grizzly bears will do more harm than good to the environment as well as the populace.

Given that these animals will be relocated from where they once were roaming and released into foreign environments would exacerbate the bear's threatening behavior. This could lead to more attacks on those who enjoy the outdoors and Washington's beauty. It would be no surprise that we will see these kinds of incidents in the near future.

The expenditure on relocating these bears into our environment is not money well spent. Every year people from around the country and abroad get to enjoy what Washington State has to offer, from its Parks and Recreation to its natural resources. Access to these lands is deteriorating and are limiting access for hikers, hunters, animal/bird watchers and outdoor enthusiasts alike. The state needs to focus on rehabilitating access of forestry roads rather than relocating and introducing predators to the State.

Please reconsider this reckless project and look into reinstating and reinforcing access to Washington's beauty.

Don't deter it to its inhabitants.

Correspondence: I am writing to express my strong opposition to the Grizzly Bear "Restoration" Plan for the North Cascades. I am 34 years old, and a third generation resident of Mazama, Washington. I grew up on a livestock farm located in Mazama with my childhood spent learning about the outdoors. I have been blessed with hiking, climbing and backpacking throughout the Cascades and packing horse trains into the Pasayten Wilderness. I believe that introducing grizzly bears into the Cascades poses significant risks and concerns.

As a child, and now adult, I would frequently backpack the PCT with my family. I grew up completing a "Peak of the Week" challenge with my dad and local friends and have now summited most of the local mountains over Washington Pass. My brother and I packed our horse trains countless times into the Pasayten, under the age of 18 and got to experience the tranquility that the wilderness offers. This was all done because we felt safe in the outdoors. With my experience I also consider myself a conservationist but at the same time am strongly opposed to this issue.

One primary concern is obviously for public safety and the potential danger that grizzly bears may pose to outdoor enthusiasts like myself. While I understand the importance of maintaining a diverse ecosystem, the safety of individuals who explore and coexist in these areas should not be compromised. Those that are arguing that the risks posed by grizzly bears are greatly exaggerated are wrong. The population in the Methow Valley has greatly increased in the last five years and are mainly from the Seattle and greater city area. They do not have the experience or have spent time in the outdoors to have knowledge of this. I will also mention that the Methow Citizens Council, an advocate for the restoration project, completely consists of second home owners and recent residents to the Methow Valley. I strongly urge you to listen to the people who have to live with the real consequences of the impact of this decision, rather than listen to the philosophical reasons.

After living in Bozeman, Montana and its surrounding areas for 8 years, I directly felt the looming anxiety of trying to coexist with grizzly bears. Every single year there are multiple, life threatening and fatal encounters. While living there, I never went anywhere without bear spray, even small local hikes. I eventually bought a gun as this was the only safe way one could backpack or complete the long day hikes offered in the surrounding mountain ranges. My enthusiasm for the outdoors rapidly declined and I found myself only adventuring in large groups, with bear guns. One reason I loved returning to the Methow Valley was my urge to solo adventure returned and I now venture daily into the mountains with my dog with neither bear spray or a gun. If Grizzly bears are introduced, this will not be the same for me and the Cascades will no longer offer the peace as they currently do.

Furthermore, I can say that again, as a third generation resident of the Methow Valley, I know that grizzly bears, with the exception of one in the 1940's, do not reside here. That is not because they were ever targeted or hunted. I would like to suggest an alternative conservation strategy, one that is not as controversial as introducing a large predator. The resources required may also be better used for other conservation efforts or community needs.

I would like to highlight the apparent inconsistency in the Washington Department of Fish and Wildlife's approach to wildlife management. It seems contradictory to express concern over the mule deer and elk populations while simultaneously introducing additional predators such as wolves and grizzly bears into the Cascades. In Winthrop, two thirds of WDFW's wildlife units are being closed this winter to protect its migratory mule deer herd, yet we are introducing grizzly bears? Okanogan District Biologists have also been quoted multiple times reporting a recent "crisis point" for the deer population. As an advocate for responsible hunting, and a hunter myself, I am troubled by the potential impact of these predator introductions on the elk herds and other wildlife whose habitat is the Cascade Range.

I urge the department to consider alternative approaches to conservation that do not compromise public safety and the delicate balance of existing ecosystems. It is crucial to strike a balance that ensures the protection of wildlife while also safeguarding the interests and safety of outdoor enthusiasts who contribute significantly to the region's appreciation and

conservation.

Thank you for taking the time to consider my concerns. I hope that the Washington Department of Fish and Wildlife will carefully evaluate the potential risks and consequences associated with the Grizzly Bear Restoration Plan for the North Cascades.

Correspondence: As someone who enjoys hiking in the cascades with my family and going on trail runs, I do not want grizzlies wandering in the forest. It would be one thing if grizzlies migrated back, but to intentionally re-introduce them seems like an unnecessary risk. Having a management plan for human-bear conflicts is not sufficient - let's prevent them by not re-introducing the bears. Ecosystems change and adapt to change all the time. I don't think it was right to kill off the grizzlies in our region, but it's done. Let's not over-meddle in the other direction and create more problems.

Correspondence: I live in Montana and have for the last 24 years. My husband and I have backpacked in grizzly bear country (Yellowstone National Park very frequently, Glacier National Park less often and some mountain ranges outside the National Park system).

We carry bear spray and make noise when we see signs of bear or were hiking on trails in brush.

We always hang our food. We never pitched our tent near our cooking area or the bear hangs.

We often see grizzlies at a safe distance, and never have had a dangerous encounter.

I fully support the maximum reintroduction of Grizzly Bear to the North Cascade National Park. We also backpack in the North Cascades, having hiked the Pacific Crest Trail and the Pacific Northwest Trail.

Correspondence: I strongly agree with plans to reintroduce grizzly bears into the Cascade Mountains areas described here. Encouraging, supporting, and fostering a full spectrum of wildlife populations is good for the natural world and for humans. The risks posed by these animals are minimal and overstated by those opposed. Thoughtfully and carefully moving into and through natural environments is important to avoid all sorts of risks. Falls on uneven terrain are far more common and dangerous than a few dozen animals spread out over many miles. Please continue your excellent work on this and other projects.

Correspondence: As a keystone species, grizzly bears have a positive effect on the ecosystems where they thrive. They regulate healthy populations of the animals they prey on, such as elk and moose, and keep forests healthy by dispersing seeds and berries through their feces. Grizzly bears are also known to catch salmon and bring their meals into the forest. The salmon carcasses serve as fertilizer and help trees grow strong and healthy. I refer you to the Umbrella Effect: Wherever they roam, grizzly bears are monarchs on the land. From the Yellowstone high country to the coasts of British Columbia and Alaska--where the species is often called the brown bear--grizzlies cast broad impacts over the plant and animal communities with which they share space.

Despite their predatory capability, grizzlies are opportunistic omnivores, not carnivores. In most places, their diet relies significantly on plant foods, as bears dig for roots and browse for berries from spring to fall. Aside from the fish-loving coastal brown bears, the meat grizzlies eat often comes from grubs and moths, or from scavenging animals that died from other causes. When grizzlies kill larger animals for food, they are opportunists, picking off the weakest prey from a group in order to save energy.

However, a grizzly fills its stomach, the process plays a key role in the balance of a natural area. By digging for roots and insects, a bear freshens soil like a rototiller. Its scavenging and digestion of dead animals returns energy quickly to the ground, fertilizing the soil that grows the plants upon which a place's food web relies. Meanwhile, the presence of grizzlies keeps deer and elk herds on the move, preventing them from lingering in an area so long that they overgraze its shrubs and grasses.

It adds up to a simple biological truth: where grizzly bears walk the land, other plant and animal species are healthier. In scientific terms, this wide-reaching impact makes the grizzly an umbrella species.

Thank you for your attention to this very important matter.

Correspondence: I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

Having wiped out the grizzly bear over the past 150 years we now have the unique opportunity and the ethical obligation to restore them to their native home, where suitable habitats still exist.

People and grizzly bears can coexist and thrive. They do so in British Columbia, Montana, and Wyoming where grizzly populations and back and front country recreation continue to grow hand in hand, providing a vital economic boost to those areas' gateway communities.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

The North Cascades Grizzly Bear Recovery Zone (NCGBRZ) is the second largest of six such designated areas at nearly 10,000 square miles. Combined with contiguous protected areas in British Columbia, including Manning Park, there are 14,000 square miles of productive, wild habitats, wilderness, and roadless areas.

I support Alternative C: Restoration with Section 10(j) Designation. Alternative C is the best choice for bears and the people who live in and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Correspondence: I am very opposed to the reintroduction of Grizzly Bears to the NCE. I approve of Option A under this Draft EIS, do nothing. The last confirmed Grizzly Bear sighting was in 1996. If our ecosystem and environment has not suffered adverse consequences in almost 30 years, then why are they now being deemed of such importance? I sat in on the Darrington public comment meeting, where I heard the Sauk-Suiattle tribe speak out about how their traditions and food sources have changed over time, and Grizzly Bears are not needed for them to continue their cultural practices and sustenance of life. This goes directly against the one of the prime objectives listed for this proposal- "seek to support tribal culture and spiritual values related to the grizzly bear". We need to listen to their peoples as they were here long before us, and coexisted with the grizzlies first.

Correspondence: To all involved in this decision of reintroducing Grizzlies to the North Cascades of Washington state:

As one who has cherished, roamed with and studied wildlife my entire life and careers, I am adamant that Grizzlies are NOT reintroduced to the North Cascades mountains and park and forests.

My first question is what good will this do for them? As humans we decimated their population, is this what you want to do AGAIN? Human-bear interactions have never worked for the bear, no matter how you manage it all or efforts you make or thoughts you have of it working, the animal always loses.

My husband and I are Pro wildlife but also pro bear, meaning we love all wildlife and to look out for their welfare, is to leave the area as is.

Mountain Goats were introduced into the Olympics, then moved to the Cascades because, again, human and wildlife do not coexist, with the animal always the loser. Many perished in this transition. Then wolves were introduced to many areas, AGAIN, we end up shooting them in cold blooded murder of numerous families of wolves. How is this good at all for the animals, the ecosystem, anyone and everyone?

If Grizzlies are reintroduced, we only see negative interactions of humans and wildlife AGAIN with the outcome always being death for the wildlife. We see absolutely no reason to reintroduce the Grizzlies. You may think that you're putting them far from humans into the wilderness, but we all know that more and more humans are exploring and recreating/hunting/poaching deeper into the wilderness as human population explodes. This is NOT something our wildlife agencies need to add to their management woes. PLEASE think of the animal and not your human fantasies in decision making. WHO BENEFITS AND WHY?

Thank you for reading this and realizing this is not a good thing for the future of humans and Grizzlies.

*██████████ Anacortes, WA.

Correspondence: The purpose of my comment is to voice my NO vote for planning to introduce the Grizzly Bear to the North Cascades.

My decision is based on three research articles/letters and a lifetime of living in Washington State. .

1. The use of the North Cascades by humans' peaks in the summer and fall months. The appetite of bears increases during these same months. The opportunity for the bears to collide with the campers, hikers, horse, mule riders is great. Therefore, we are in present in the same annual time period while there are more humans using the forests/meadows/back county trails for recreation in this State year to year. (Backcountry Horsemen.

2. "Bearing UP" is a WSU published article sharing how the University is currently researching bear resistant food coolers (magazine.wsu.edu /extra/cooler-bears). Humans bring in food that all bears smell and like. This "new" food source will be learned by the Grizzlies very quickly and draw them to human odors, animals, camps and vehicles.

3. I have read the Environmental Impact Statement. It indicates the human use is insignificant. We are significant! We build and clear the trails; we use the trails, and we provide emergency services to the human and animal populations living and using the area. We also kill the very predators Supporters wish to introduce when they enter human areas and commercially harvested forest and farm areas. I know this to be true from horseback riding in Federal and State and Private Forestlands owned by Weyerhaeuser, Green Diamond and other companies. I listened to the Vail Forest black bear cries suffering in traps set by Federal workers (Hell of a way to make a living I think.). So why bring Grizzlies into unwelcome areas, I believe, they will just kill or be killed. We aren't ready for this in Washington. And certainly not necessary at this time for Grizzly or human protection if not done. NO ACTION PLEASE.

Correspondence: Do not reintroduce Grizzly Bears to the NCE. The benefits of reintroducing a once native species is far outweighed by the detrimental and negative consequences taking this action would lead to. I have read through the draft EIS summary, and there are very alarming details in there leading me to this conclusion.

For example, the information provided stated that the last habitat evaluation done on the NCE was 1986-1991. Over 30 years ago. They are using model projections for growth to calculate the current carrying capacity. I'm not sure there is any model that could accurately depict the immense changes in population, climate, industry, and access that we have seen in the Pacific Northwest over the last 30 years. Before proceeding, I would expect a more recent survey to be conducted on the sufficient habitat available for grizzly reintroduction.

Another concerning line in the draft summary reads like this- "primary restoration activities under alternative B would not involve any disturbance of fish habitat. Fish are not expected to be a primary food source for grizzly bears." Where is the research on this? Animals go for the easiest food source available, that is why we are continuing to see black bears in suburban neighborhoods all over the Pacific Northwest. Their lands are being encroached upon by housing and instead of leaving, they are staying because they can eat out of garbage bins. When the high mountain berries dry up, and the grizzly's are still hungry, what is stopping them from going to the alpine lakes, then the rivers to continue their foraging? How far down river will they continue to venture? How long before they get low enough and have a year-round food supply that they no longer need to hibernate? I disbelieve the draft statement on fish habitat, unless further research and proven studies can be shown.

Choose draft alternative A- the do nothing stance.

Correspondence: Three or four years ago an initial proposal to reintroduce grizzly bears was circulated and comments were collected and published. I took the time to review the over one thousand comments for positive or negative response, and to note where the respondents lived.

1. The negative responses greatly outnumbered the positive ones. The respondents who did not wish to have the grizzlies reintroduced were mostly local residents, farmers, climbers and hikers. A great many were from the Methow Valley which protrudes deep into the North Cascades. A common statement was, "are you crazy?"

2. The positive responses were largely from out-of-State individuals including many from the East Coast and Europe, who seemed to believe the Reintroduction Area to be pristine wilderness where little contact with the population might occur.

My Comment: The new Recovery zone is larger than the initial proposal and encompasses literally hundreds of miles of forest roads and trails heavily used by our Puget Sound populous each summer. The chance of encounter is much higher, I believe, than the Montana-based proponents suggest.

I do not believe you are paying enough attention to all the potential bear food the many thousands of apple and other fruit trees that are present within and adjacent to the recovery area.

I have read that even though there are not a lot fruit orchards near Yellowstone or Glacier NP, a number of grizzly bears have traveled quite some distance outside of their home ranges in order to help themselves to some fruit.

Some years ago, I was fortunate enough to be invited to attend the one week grizzly course in Yellowstone at the facilities in the Lamar Valley. I was with a group of folks from the Wenatchee Valley at lunch one of the days when one of the professional biologist came over to eat with us. He suggested that the reintroduction of grizzly to our area, on the east slope of the cascades would be quite problematic due to the vast area of orchards in and adjacent to the recovery area. He suggested that the bears would likely be able to smell the apple orchards from dozens of miles away and travel to them.

Assuming that the information that I have read and heard is correct, you need to have a much more detailed plan than you have presented in order to be successful in keeping the grizzly out of the orchards. Few of the orchards are fenced to any extent and the logistics and cost of fencing all of them are likely prohibitive for both the owners and for the government. In addition, I have heard that the WDFW has not been at all helpful when an orchard owner has a black bear problem.

You need a more detailed plan of action for when a grizzly finds an orchard.

Correspondence: I am in accordance with draft EIS alternative A- do nothing to reintroduce grizzly bears to the NCE.

My biggest concern with either of the action alternatives is the access and tourism issues that may arise with the

reintroduction of grizzlies. Highway 20- the main highway through the North Cascades, is closed for half of the year due to snow. This means all the small towns on either side of the mountain pass are fully reliant on tourism business during the summer and fall months to sustain the year. Living in Arlington, a close neighbor of Darrington, my wife and I often find ourselves out there year round visiting friends. I can tell you from experience, it is a ghost town after the pass gets closed for the season. Business hours are reduced, and some even close up shop a few days a week. I believe the same is true for Winthrop, an even larger tourism town. If grizzly sightings start closing off trailheads for hiker safety, or if people are just not comfortable being up there anymore, that will directly impact several small businesses that are barely hanging on in these small towns.

Another concern is access for hikers. I'm not sure if you have driven over Highway 20 in the summer, but there are cars lined up for miles on the sides of the highway near trailheads. This is a super population destination for day hikers, and overnight backpackers. How are you going to keep that many people safe with grizzly bears in the mix? Will there be a permit requirement for hiking access like there is at places like Mt. Rainier? How many permits will be given out? The same amount as the current hiking brigade we see every year up there? If less permits are given than the current amount of hikers up there, that will lead directly back to the tourism financial issue. Do people like going up there now because there is no waiting or permitting period?

There are too many unknowns in the action alternatives, and at some point one party, or several parties, will suffer the consequences at the expense of having grizzly bears reintroduced. Please, please, do not reintroduce grizzly bears to our backyard.

Correspondence: As a lifelong resident of Darrington, and avid outdoorsman, it is disheartening to once again see policies that directly affect myself and my neighbors being pushed by people from large cities and distant states who have no real connection to any consequences that may result. Our salmon, deer and elk populations continue to suffer under the regulations put in place by people who have no real connection to any part of the situation other than uninformed feelings. Adding more large predators to the area will not add to the health of the ecosystem as it may have in places like Yellowstone. Yellowstone is a large, fully protected area with minimal human competition, the North Cascades is my backyard. The population of deer and elk will not sustain more predators on the landscape. Even with the 10j rule allowing for management the Washington department of Fish and Game has shown an appalling bias toward restricting hunting, especially the hunting of predators.

History has shown that "reintroduction" of animals rarely happens without unexpected downstream effects. With wolves bringing hoof rot to the elk or goats attacking people for their urine, we need to leave nature to sort itself out. I am against bringing Grizzlies to the north cascades. I am against being the feel good nature show for people in Seattle to look at and think they have "helped"; I am against being part of the group most affected and least acknowledged.

Correspondence: I am writing to express my opposition to the proposal of restoring and managing grizzly bears in the North Cascades of Washington. I am a hiker and I enjoy exploring the natural beauty of this region. However, I do not want to worry about the danger of encountering a grizzly bear on the trail.

Grizzly bears are large, powerful, and unpredictable animals that can pose a serious threat to human safety. According to the National Park Service, grizzly bears have killed 10 people in Yellowstone National Park since 1980¹. In 2020, a grizzly bear attacked and killed a hunter in Alaska². These incidents show that grizzly bears are not compatible with human recreation and activities.

Moreover, grizzly bears are not native to the North Cascades and have not been confirmed in the area for decades. The last confirmed sighting of a grizzly bear in the U.S. portion of the North Cascades Ecosystem was in 1996³. Therefore, restoring grizzly bears to the North Cascades would not be a natural recovery, but an artificial introduction of a non-native species. Furthermore, grizzly bears are not endangered or threatened in the U.S. as a whole. There are about 55,000 grizzly bears in the U.S., making homes in only 5 states⁴. The grizzly bear population in the Greater Yellowstone and Northern Continental Divide ecosystems has recovered and is ready for delisting⁵. Therefore, there is no need to restore grizzly bears to the North Cascades for the sake of conservation.

I urge the National Park Service and U.S. Fish & Wildlife Service to reject the proposal of restoring and managing grizzly bears in the North Cascades. This proposal would endanger the lives of hikers, hunters, and residents in the region,

and disrupt the natural balance of the ecosystem. Please consider the interests and safety of the human population over the unnecessary and risky reintroduction of grizzly bears. Thank you for your attention and consideration.

Comments

Draft September 2023 Grizzly Bear Restoration Plan/EIS North Cascades Ecosystem

Thank you for the opportunity to comment on the Draft September 2023 Grizzly Bear Restoration Plan/EIS North Cascades Ecosystem.

On December 13, 2022, I provided "Public Scoping Comments" on the 11/14/2022 "Notice of Intent to Prepare North Cascades Ecosystem (NCE) Grizzly Bear Restoration Plan/EIS, WA" through the online National Park Service PEPC submittal process. Many of my December 13, 2022 comments still apply.

Following are my general comments, concerns, and specific comments.

General Comments & Concerns

I support the no-action alternative (Alternative A). In addition, I support using the 10(j) nonessential experimental population (NEP) under section 10 of the ESA, as proposed in Alternative C, so that when Grizzly Bears (GB's) do expand back into the NCE it would give state, federal, and tribal agencies greater management flexibility should conflict situations arise. Recent news reports indicate that Canadian reintroduction efforts just across the border in British Columbia, are imminent. If successful, some of these GB's could end up occupying habitat in the NCE.

Relocation/Reintroduction VS Restoration of Grizzly Bears (GB)

The Draft EA does not have any information about the relocation of GB's being used to restore populations elsewhere. It appears that the proposed GB restoration for the NCE, which recommends relocating GB's from other GB ecosystems, has never been tried before. Consequently, the potential success of this GB relocation technique as a method to restore populations has never been evaluated. For public agencies (federal, state, Canadian, etc.) to spend significant time, resources, and funding this, so far, unproven technique, combined with the high risk of injury and death to GB's which are an ESA listed "Threatened" species, during capturing (trapping, anesthetizing, transporting, etc.) and relocation (via helicopter and other methods), seems like an unwise use of public funds.

Instead of relocating GB's to the NCE implement habitat restoration actions to increase habitat diversity. Increase GB forage habitat using silvicultural treatments, prescribed fire, etc., for ungulates species (deer, elk, mountain goats, etc.) to provide more food for GB's. Increase GB forage habitat by increasing huckleberry habitat, through silvicultural treatments and prescribed fire methods. It is unclear whether, or not, these GB habitat restoration treatments have been thoroughly investigated in the NCE.

Concern about potential permanent road and trail closures for Grizzly Bear restoration.

The Draft EA makes no mention of road or trail closures, other than for temporary closures only expected to last a few hours up to a couple of days during actual GB helicopter flights to relocate bears. However, it states "Beneficial impacts could occur from the decommissioning of roads in or near species habitat" but does not state whether, or not, permanent road closures could be implemented as a result of the plan implementation. It also states that "Closure of park or forest facilities and main roads are not expected to occur" and that "it is reasonable to assume that any trail and area closures would be temporary, localized, and limited."

The Mt. Baker-Snoqualmie National Forest, which is adjacent to the North Cascades National Park, has already been implementing, or proposing permanent road closures for GB habitat management purposes, in order to meet requirements for the North Cascades GB Recovery Area MOU with the USFWS, "that there be no net loss of core habitat." (USFWS 1997). Examples include the Upper North Fork Nooksack River (MBS NF 2022), Upper Middle Fork and South Fork Nooksack watersheds, Upper Swift Creek, and Baker River (Skagit River) watershed (MBS NF 2002), and the Finney Creek (Skagit River) watershed. Will this new plan for GB's result in more permanent road and trail closures on National Forest lands

adjacent to the North Cascades National Park? These public roads and trails are critical for recreation access to these important public lands and provide significant recreation benefits to the local economies. Closing existing public roads and trails on USFS lands that provide important recreation value to the public is a significant issue.

Concern about the genetics and adaptability of the Grizzly Bears proposed to be relocated.

The Draft EA (page 58) described studies (Alamack et al. 1993; Gaines et al. 1994) that were conducted to evaluate portions of the NCE for GB's and concluded that the NCE has suitable habitat essential for the maintenance of a Grizzly Bear population. The studies identified 124 plant species known to be GB foods through an exhaustive review of studies conducted on GB's south of Alaska and that 100 of the 124 identified plant species exists in the study area. They also mapped ranges of GB wildlife prey species known to occur in the NCE study area and said that ungulates were dispersed relatively evenly throughout the study area. Based on these studies, the teams concluded that sufficient vegetative GB foods are readily available in the NCE and that occurrence of wildlife prey species can sustain a GB population. I have worked in the NCE area since 1984 and do not understand how the study could say that important GB prey species (elk, deer, mountain goats, marmots, etc.) are dispersed relatively evenly throughout the NCE. My experience is that these animals (especially elks, mountain goats and marmots) are found in certain areas but missing from many other areas in the NCE.

The EA Draft (Fig. 5, Page 59) indicates that GB's would be captured from four source areas in British Columbia that have healthy populations that are ecologically similar to the NCE: 1) Robison GBPU, 2) Wells Gray GBPU, 3) Columbia-Shuswap GBPU, and 4) North Seilkirk GBPU. Have genetic studies been conducted on these proposed source populations to determine similarities between these populations before relocating any of these GB's?

The EA Draft (page 56) describes a habitat study (Agee et al. 1989) that compared historical GB sightings to land cover types to determine which land cover types bears prefer. The results showed that GB sightings were positively correlated with whitebark pine, subalpine larch, and subalpine cover types, inferring that these are the preferred habitat types of GB's. It also noted that whitebark pine is not a common habitat type throughout the NCE and may not be as important for GB's in this ecosystem as it is in others where it is more prevalent.

How well adapted would the relocated GB's, from the proposed source areas, be to new habitat conditions in the NCE? These other ecosystems could be more different from areas in the NCE where bears could be relocated.

How successful would these relocated GB's be in a new ecosystem, which may have a different combination of food resources (plant and animal) than they were adapted to, and how viable and self-sustaining would these population be?

Specific Comments

Page 18. States "If the preferred alternative is selected, and if release sites on USFS-managed national forests were used, the USFS would have to separately comply with applicable federal laws prior to authorizing any actions on national forest lands, which could include issuing temporary closures around staging and release areas as needed per 36 CFR 261 Subpart B, 'Prohibitions in Areas Designated by Order.' Therefore, the responsible officials for the USFS will decide through their own process whether to authorize any needed actions on their respective forests."

"Prior to authorization of the staging or release of grizzly bears on USFS lands, the alternative would be implemented on NPS lands only."

For the USFS to separately comply with these federal laws they will need adequate staffing and funding to conduct this process. Based on recent USFS funding for the Mt. Baker-Snoqualmie National Forest, the chance of receiving funding is unlikely.

Page 24. Last paragraph states "Any loss of core area within the park complex would likely require mitigation on USFS land to maintain no net loss of core area for the BMU as a whole. The USFS would continue management under the no net loss agreement established by the 1997 interagency MOU until forest plans are revised or amended."

Again, the concern here is that USFS will not have adequate funding and staff to handle planning and implementing mitigation measures (road closures, etc.), let alone to revise or amend forest plans.

Page 28. Release. 2nd paragraph States "Release sites would be chosen from within three release areas, shown in Figure 3." Only the North Unit Park area is located completely within the NC National Park. The other two areas (Western Pasayten and South Unit Park and GPW) contain significant amounts of USFS land. Therefore, no GB releases can occur in the USFS lands until all USFS planning requirements are completed, which again, will take adequate funding and staffing, which is unlikely based on recent funding.

Page 30. Monitoring. 2nd paragraph states "Key uncertainties associated with the implementation of this plan include accurately predicting grizzly bear behavior, habitat utilization, and movements once released; reproductive success; genetic limitations; and source and rate mortality."

Given all these uncertainties and unknowns associated with this plan, the cost to taxpayers, and my comments above, it is unwise to pursue any action alternatives.

Page 32. Access Management. 1st paragraph states "No long-term closures or modifications to public access would be

implemented because of grizzly bear restoration. The agencies do not anticipate the need for lengthy closures such as those experienced in Yellowstone National Park because no similar bear congregation areas have been identified (e.g., areas of high prey concentration)."

However, as stated above on page 24, "Any loss of core area within the park complex would likely require mitigation on USFS land to maintain no net loss of core area for the BMU as a whole."

The MBS NF is already implementing, or proposing, permanent road closures for GB habitat management purposes, to meet requirements for the North Cascades GB Recovery Area MOU with the USFWS, "that there be no net loss of core habitat." (USFWS 1997).

Page 33. Primary Phase. 2nd paragraph states "Grizzly bears would be released at multiple sites in remote areas on NPS lands. Release sites on USFS lands could be included once USFS completes its own environmental compliance."

Again, the USFS would need additional funding and staff to complete this required environmental compliance.

Page 35. Top of page. States "Livestock depredation by grizzly bears would likely occur in the NCE."

Page 36. Management Zones. States "The proposed geographic extent for the GB NEP includes all of Washington state except an area around the Selkirk Mountains GB recovery area (Fig. 4, page 37)."

This is a huge area contains many opportunities for GB-human conflict and potential impacts to wild ungulate populations, especially those that are known to be declining, such as the North Cascades and Colockum elk herds [see page 74] and ESA federally listed salmon, steelhead, and Bull Trout populations, located in various watersheds draining into Puget Sound to the west, and into the Columbia River to the east. In addition, as stated on page 35, domestic livestock and other domestic animals would be at risk from GB impacts.

Page 48. Natural Recovery. States "A Joint Nation grizzly bear recovery partnership has been established among First nations in collaboration with the British Columbia government to outline population recovery objectives and strategies in a 'North Cascades Grizzly Bear Stewardship Strategy.' Translocation efforts in British Columbia have not started, and it is unclear how such an effort, if implemented, would impact the US portion of the NCE. Should reintroduction efforts occur in British Columbia, it is likely that some grizzly bears reintroduced into the Canadian portion of the ecosystem may move into the proposed NEP area in the U.S., either as a transient and return to Canada or may ultimately remain in the US."

Recent news reports indicate that these Canadian reintroduction efforts, located just across the border in British Columbia, are imminent. So, there is the potential for these GB's to expand south into the NCE.

Page 52. Analysis Area. States "The 6.1-million-acre recovery zone includes all of the park complex and most of the adjacent Okanogan-Wenatchee and Mt. Baker-Snoqualmie National Forests, along with small amounts of interspersed state and private land."

Page 53. North Cascades Ecosystem Description. States "The recovery zone encompasses the entire Park complex, which makes up 11% of the recovery zone, along with most of the Okanogan-Wenatchee and Mt. Baker-Snoqualmie National Forests, which together make up 74% of the recovery zone. Private lands account for an additional 7% of the recovery zone, while state and local lands make up the remaining 8%."

Again, if the GB reintroduction is successful, this huge area presents many opportunities for GB-human conflict and impacts to wild ungulate populations, ESA federally listed salmon, steelhead, and Bull Trout populations, as well as domestic livestock and other animals.

Page 83. Predator-Prey Interactions. States "In summary, grizzly bears released into the NCE are expected to have an opportunistic feeding strategy and may prey on ungulates if encountered during spring calving/fawning season. Grizzly bears are expected to kill deer and elk, mainly fawns/calves, and small numbers of moose, particularly neonates."

Page 84. 2nd paragraph. States "Once restoration population goal is achieved, grizzly bears would have a greater impact on other wildlife and fish via predation. Grizzly bear distribution in the NCE would expand throughout secure core habitats and increase the potential for bears to encounter ungulate calves in spring or spawning salmonids, and potentially impacting local recruitment of wild ungulates or spawning of local salmon runs."

Again, if the GB reintroduction is successful, this is a huge area with many opportunities for GB-human conflict and potential impacts to wild ungulate populations, ESA federally listed salmon, Steelhead and Bull Trout populations, as well as domestic livestock and other animals.

Correspondence: One of the things I love about the North Cascades is the vastness, ruggedness, and seemingly untouched wilderness there. However, its not really untouched at all. Human intervention has eradicated one of the greatest native species in the Cascades - the grizzly bear. I believe true conservation of this land should include reintroducing the grizzly through the 10(j) designation. Supporting a harmonious balance between bears and the people of this area is most likely to ensure the long term success of the reintroduction project. Grizzlies play a vital role in the native ecosystem and that ecosystem is what those of us who live here and recreate here love most.

Docket No. FWS-R1-ES-2023-0074

City: * Okanogan State/Province: * WA Postal Code: * 98840

Organization: Self Employed/Delfeld Farms

Date: November 12, 2023

Comments or Requests: I am a landowner in Okanogan County, producer, Small Business Owner, Wildland Fire Contractor and our Farms is 3rd Generation Cattle and Farming operation. To stay in business, we have had to diversify, update, change and make current our business plans. We are not operating under business plans our 1st generation Grandparents

created our cattle and farming operations. We have changed for many reasons some we have been forced, due to government regulations. Why is the National Parks Service referencing to, and operating under 30,32-,37- and 41-year-old, outdated plans, documents and studies throughout this EIS document to support introducing grizzly bears? None of us in private business, would still be in business, operating under those same circumstances. Please see my specific substantive comments supporting Alternative A: NO ACTION
NO to Section 10(j) ESA RULE needed.

I am requesting NPS to respond to my comments, to myself and the people of Okanogan County.

NEPA requires Agencies to consider the reasonably foreseeable projected lifetime outcome direct and indirect short-term and long-term effects of their proposed actions and reasonable alternatives.

- The Agency failed to fully, openly and adequately address NEPA requirements on several levels as required.
- Agency failed to address significant economic impact on a substantial number of small entities.
- Agency failed to consider reasonably foreseeable direct and indirect effects of their proposed actions and alternatives as well as no action alternatives short- and long-term effects pertaining to all aspects to Okanogan County customs and cultures, citizens, businesses, producers, our way of life, industries and recreation activities.
- Agency failed to address who is responsible when grizzly bears kill our family members?
- Agency failed to address who will pay for loss of life?
- Agency failed to address what process will be for loss of livestock loss reimbursement cost.
- Agency failed to address who is Liable?
- Agency failed to address and outline the Emergency process to the citizens of and/or the visitors to Okanogan County WHEN a grizzly bear attack occurs on a family member, employee, livestock, pet, etc.
- During large wildland fire incidents, temporary cell towers are brought in, for cell coverage in our remote areas. There are many areas in Okanogan County with NO CELL SERVICE!
 - o The Agency failed to address, For example:
 - o Who will people call when we have a grizzly bear emergency?
 - o What procedure has been established with our local Sheriff 911 Dispatch?
 - o Has this plan been approved by our Elected County Sheriff?
 - o Will they call North Cascades NPS in Sedro Woolley?
 - o Will a NPS employee be available by phone 24/7?
 - o How long will we have to wait until an "official government representative" shows up before we can remove our wounded/eaten/mauled family member or livestock to prove it was a grizzly bear attack? (As we have learned from the introduction of wolves).
 - o Are we to take pictures of our wounded?
 - o Pictures of the grizzly bear before the attack on us?
 - o Does the agency really expect us to contact them for permission to kill a grizzly bear that just killed one of our family members? When our Constitution give us our RIGHTS to protect our LIVES/FAMILIES?

Agency failed NEPA requirements.

The Agency failed to address clearly, reasonably foreseeable projected lifetime outcome direct and indirect long-term and short-term effects of their proposed actions and reasonable alternatives of these realistic issues to the residents of Okanogan County.

Alternative A: NO ACTION

NO to Section 10(j) ESA RULE needed.

The Agency failed to address Okanogan County Search and Rescue, including Back Country Horsemen, ATV/UTV into remote areas finding lost, injured/hurt hikers. The Agency through their proposed alternative will be putting each and every search and rescue member in deaths way of grizzly bear attacks.

- Horses can smell bears from a distance before humans can visibly see bears, potentially causing severe turmoil for the rider.
- Potential attack on the horse and rider from grizzly bear killing horse and/or rider (s)
- Potential harm to one or more of the search and rescue horses or riders
- Agency failure to address: Potential breakdown of one of the UTV/ATV engine failure/flat tire causing effect of "sitting duck" potential grizzly bear attack on one of the search and rescue members.

Agency failed NEPA requirements.

The Agency failed to address clearly, reasonably foreseeable projected lifetime outcome direct and indirect long-term and short-term effects of their proposed actions and reasonable alternatives of these realistic issues to the residents of Okanogan County.

Alternative A: NO ACTION

NO to Section 10(j) ESA RULE needed.

As stated, The U.S. Fish & Wildlife Service is separately inviting public comment on a proposed rule under section 10(j) of the Endangered Species Act that The Agency will "Provide local communities more flexibility to manage the grizzly bear population with additional wildlife management tools."

Section 9 of the ESA describes prohibited acts under the law. For endangered species, along with other prohibited acts, it is unlawful to take any endangered species (16 USC 1538(a)). The term "take" means to "harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct" (16 USC 1532(19)). Whenever any species is listed as threatened (e.g., grizzly bear), the FWS issues regulations under section 4(d) of the ESA that are necessary and advisable to provide for the conservation of the threatened species. The 4(d) rule is the mechanism by which take prohibitions can be applied to threatened species. Section 10(a)(1)(A) of the ESA provides exceptions to the take provisions. Under section 10, the FWS may permit acts that purposefully take threatened or endangered species so long as those actions are for scientific purposes or "to enhance the propagation or survival of the affected species." Section 10(a)(1)(B) allows the FWS to permit take that is incidental to, and not the purpose of, the carrying out of otherwise lawful activities (16 USC 1539(a)(1)).

Comment:

ESA was specifically designed to protect endangered species at all costs. There is not flexibility that is easily "Provided" to local communities to manage. There are too many hoops, we must jump through, that takes time, or phone calls we must make, in a county that in some areas has little to no cell coverage, to make emergency calls! So, no, I do not believe there is any government program that can provide this. This statement is misleading to the people of Okanogan County and provides false hope that we will be able to take care of a grizzly bear emergency issue ourselves without penalty.

The Agency has failed transparency, clear explanation of plan and how it will be carried out:

- The comment, "Provide local communities more flexibility to manage the grizzly bear population with additional wildlife management tools," in full detail to be understood, upfront, prior to EIS decisions, what actions, if any, can be taken when a grizzly bear attack happens.
- What will be the response time after a Grizzly Bear attack on any livestock?
- Person, or family pet?
- Who will people call when we have a grizzly bear emergency?
- What procedure has been established with our local Sheriff 911 Dispatch?
- Has our Elected County Sheriff approved these procedures?
- Does the public call North Cascades NPS in Sedro Woolley?
- Will a NPS employee be available by phone 24/7?
 - o Okanogan County doesn't have enough Deputies to staff 24/7 shifts.
- How long will we have to wait until an "official government representative" shows up before we can remove our wounded/eaten/mauled family member or livestock to prove it was a grizzly bear attack? (As we have learned from the introduction of wolves).
- Are we to take pictures of our wounded?
- Pictures of the grizzly bear before the attack on us?
- Will immediate permission be given to us to kill a grizzly bear, without the threat of going to jail, under Section 9 ESA?
- Specifically address what fines will be assessed on us for the taking of a grizzly bear?
- WE understand our Constitutional rights, however, specifically explain how Agency Employee's will interpret our rights.
- Does the Agency understand in the majority of our county, has NO cell phone service?
- During or after grizzly bear attacks, getting medical aide to our family members before they die, could be impossible, how does the agency expect us to contact them for permission to kill a grizzly bear that just attacked our loved one, before they kill the entire family?

The agency failed to specifically outline plans to address any and all of these very important questions that will impact

residents and visitors of Okanogan County when grizzly bear attacks occur.

Agency failed NEPA requirements.

The Agency failed to address clearly, reasonably foreseeable projected lifetime outcome direct and indirect long-term and short-term effects of their proposed actions and reasonable alternatives of these realistic issues to the residents of Okanogan County.

Alternative A: NO ACTION

NO to Section 10(j) ESA RULE needed.

North Cascades National Park Service: "North Cascades Ecosystem Grizzly Bear Restoration Plan/EIS" It implies that Grizzly Bears will only be released into the North Cascades Ecosystem. This statement is false and misleading. This information is within the EIS; however, all other publicized information is related to "North Cascades Ecosystem" implying to North Cascades Mountain Pass area, NOT the actual land mass as described within the document.

The NCE itself, is comparable in size to the state of Vermont, encompassing approximately 9,800 square miles, or 6.1 million acres, within the state of Washington (FWS 1997). Situated in the core of the area of analysis is the 680,855-acre North Cascades National Park Service Complex (park complex). The park complex includes North Cascades National Park and Ross Lake and Lake Chelan National Recreation Areas and makes up approximately 11% of the NCE grizzly bear recovery zone. The 642,340-acre Stephen Mather Wilderness composes approximately 94% of the park complex. The park complex is bounded on the east, west, and south by national forest lands. These lands consist of most of the Mt. Baker-Snoqualmie and Okanogan-Wenatchee National Forests, including nearly 2 million acres of wilderness, and make up roughly 74% of the NCE grizzly bear recovery zone (for a total of 85% of federally managed land in the NCE). Approximately 8% of the NCE grizzly bear recovery zone is made up of state and local lands including state parks and Department of Natural Resources lands, and 7% is made up of private lands (FWS 1997).

Comment: Agency failed to clearly communicate to the public the actual land masses the grizzly bear EIS will cover. Agency implying "North Cascades Ecosystem" SHOULD have stated "6.1-Million Acres North Cascades National Park Service Complex Ecosystem" throughout the State of WA.

Okanogan County 3.5 million acres is the largest County in WA ST. Private land ownership is probably 6% or less. We carry the tax burden, struggle to stay in business with the heavy unnecessary regulations from the State and Federal Government, fighting for our private property and water rights, fighting against wolves, cougars now agency employees want to help build numbers of grizzly bears. When grizzly bears already exist in at least two locations, north of Okanogan County adjacent to Canada and in NE WA in WA STATE, adjacent to Idaho.

Agency failed NEPA requirements.

The Agency failed to address clearly, reasonably foreseeable projected lifetime outcome direct and indirect long-term and short-term effects of their proposed actions and reasonable alternatives of these realistic issues to the residents of Okanogan County.

Alternative A: NO ACTION

NO to Section 10(j) ESA RULE needed.

From EIS document: "Other Wildlife and Fish

"Wildlife or fish species such as elk and deer, black bear, and salmonids could be affected in terms of grizzly bear predation or competition for resources".

Comment:

The Agency failed to meet NEPA requirements especially regarding salmon.

The Agency failed to provide sufficient evidence that long term negative impacts to the Salmon population, that all of us have had to adjust water, agriculture operations, road construction, housing developments, building, taking land out of production, purchasing land with waterfront and water rights all around saving and building salmon populations in Okanogan County. Introducing Grizzly Bears that it's a proven fact they will have a negative impact on salmon and put us back on all of our salmon recovery efforts that millions and millions of dollars have been spent and have cost us for salmon recovery already.

- Quick research: an average male grizzly bear can eat 30 salmon a day
- Agency Staff goal grizzly bear population will be 200

- 200 X 30=6,000 salmon a day could potentially eaten a day
- Or 6,000 X 360 days a year=2,160,000
- If I could do the quick research and math, why did Agency personnel fail to provide this information?

SO, 2 MILLION, ONE HUNDRED SIXTY THOUSAND SALMON A YEAR potentially to our salmon recovery efforts! I'm not a fish biologist, I'm not in salmon recovery, but to me it sounds like it could be a major impact to Okanogan County salmon recovery efforts! Again, when we all have been forced to change our farming, ranching business management practices, costing us thousands of dollars for the salmon, and the Agency provided NO information, NO studies, NOTHING regarding this government driven issue, that WILL be impacted! WHY?

Agency failed NEPA requirements.

NEPA requires Agencies to consider the reasonably foreseeable projected lifetime outcome direct and indirect short-term and long-term effects of their proposed actions and reasonable alternatives.

Alternative A: NO ACTION

NO to Section 10(j) ESA RULE needed.

Wilderness Character: Portions of this section are included:

Together, the park complex and surrounding national forest wilderness areas protect over 2.6 million acres of federally designated wilderness within the NCE. Grizzly bear restoration activities could affect wilderness character and values for solitude or primitive and unconfined recreational qualities of wilderness character.

Comment:

- Agency admits their own actions will result in varying effects on wilderness.
- Utilizing helicopters, possibly airplanes.
- Agency staff will be introducing grizzly bears, monitoring, relocating.
- As grizzly bear numbers increase so will the activities of the agency.

However, these actions are acceptable because it's the agency personnel performing these actions and impacts, with their main goal, at all costs, to introduce the grizzly bears. The Agency has ignored local comments from the people that will be impacted. As you read the next paragraph, you will clearly understand, close roads, stop cattle grazing, with no mention of the benefits of rotational cattle grazing studies.....

The Agency failed to meet NEPA requirements.

NEPA requires Agencies to consider the reasonably foreseeable projected lifetime outcome direct and indirect short-term and long-term effects of their proposed actions and reasonable alternatives.

Alternative A: NO ACTION

NO to Section 10(j) ESA RULE needed.

Trends and Planned Actions:

USFS forest vegetation management projects could have both beneficial and adverse impacts on grizzly bears if bears return depending on whether they create opportunities to enhance habitat for certain species. Cattle and sheep grazing on USFS lands could have adverse impacts on grizzly bears if conflicts with grizzly bears occur. Beneficial impacts on grizzly bears could occur from decommissioning roads for a 63

variety of reasons unrelated to grizzly restoration actions in or near sensitive habitat. However, trail maintenance, mountain lake restoration, motorized travel management, and administrative flights may temporarily disturb grizzly bear habitat, while ski area expansion projects on USFS lands could have adverse impacts on grizzly bears or habitat because land clearing could disturb and fragment additional habitat. Cattle and sheep grazing on USFS lands would continue to impact wildlife and fish habitat by altering the composition, structure, and productivity of plant communities. In general, grazing adversely affects species that require denser cover for protection and benefits species adapted to open habitats. Grazing degrades riparian and instream habitat and increases competition among fish and wildlife for resources.

Comment:

Comment: After reviewing the EIS document, it is very obvious the Agency Personnel/Employees approving this EIS has several underlying goals OTHER THAN introducing grizzly bears. The Agency, through the EIS admits WA ST already has grizzly bear locations in our STATE in at least two locations repopulating themselves. Current, 2020 and 2022 studies

confirm grizzly bears are re-populating in the natural habitat adaptation ecosystems they are choosing. One location, north of Okanogan County, they travel back and forth across the Border to Canada, the other location in NE WA, they can travel into N. Idaho if they choose. However, to achieve Agency, Employee, underlying goals, are using grizzly bears as their introduction to:

- Close roads
- Stop cattle grazing
- Limit public access to public lands
- Stop future ski expansion areas
- "Prohibitions in Areas Designated by Order."
- The benefit and enjoyment of present and future generations of people.
- "Beneficial impacts on grizzly bears could occur from decommissioning roads for a 63 variety of reasons unrelated to grizzly restoration actions in or near sensitive habitat".
- Agency failed to address the items listed above that could be perceived by the public that were attempted to be "hidden" within the document.
- The agency must explain why they failed to address the agency's goals of road closures, limit public access to public lands, stop cattle grazing, stop future ski expansion areas, beneficial impacts on grizzly bears could occur from decommissioning roads for a 63 variety of reasons unrelated to grizzly restoration actions in or near sensitive habitat, prohibitions in areas designated by orders.

The Agency failed to meet NEPA requirements.

NEPA requires Agencies to consider the reasonably foreseeable projected lifetime outcome direct and indirect short-term and long-term effects of their proposed actions and reasonable alternatives.

Alternative A: NO ACTION

NO to Section 10(j) ESA RULE needed.

Visitor Use and Recreational Experience

including hiking, backpacking, camping, climbing, fishing, horseback riding, bicycling, boating, winter sports, and wildlife viewing. Opportunities for hunting are available in the NPS national recreation areas and on the national forests and state-owned lands, and off-road vehicle use is permitted on portions of the national forests (USFS 2016a,b). The park complex offers a variety of educational and interpretive programs, visitor facilities, and lodging facilities (NPS 2012b). The restoration of grizzly bears to the NCE could increase visitation and recreational use of the NCE as visitors seek to experience grizzly bears in their native habitat.

Comment: The Agency failed to provide the public of the long term reasonably foreseeable direct and indirect short-term and long-term impacts our people and visitors to Okanogan County can/might expect from grizzly bear introductions.

- The agency admits restoration actions that result in an increased grizzly bear population could also affect recreational opportunities for visitors who do not wish to encounter grizzly bears.
- The Agency is not being forthcoming. They know of grizzly bear attacks on public, camping, hiking and various outdoor activities from other States.
- They have realistic examples they have not shared or considered with the public. Why?
- Is the agency going to wait until one loss of life in Okanogan County THEN analyze that? NO

The Agency failed to meet NEPA requirements.

NEPA requires Agencies to consider the reasonably foreseeable projected lifetime outcome direct and indirect short-term and long-term effects of their proposed actions and reasonable alternatives.

Alternative A: NO ACTION

NO to Section 10(j) ESA RULE needed.

Bear-related Public and Employee Safety

Agency admits, negative interactions between humans and grizzly bears, while rare, do occur. Every situation is dynamic, and a grizzly bear's reaction depends on a variety of factors including the proximity between a bear and a human, the type of encounter (i.e., whether the bear is behaving in a defensive or offensive manner), and whether cubs or a valuable food resource are involved, among other considerations (Herrero 2002). The restoration of grizzly bears in the NCE has raised

concerns about safety risks to residents living in and adjacent to the NCE, as well as backcountry recreationists and other visitors because of the potential for negative grizzly bear interactions. Although rare, human injuries from grizzly bears can and have occurred in other ecosystems. In addition, the capture, release, and monitoring of grizzly bears could affect employee safety because of the dangerous nature of the activity--one of the two reported injuries listed above was to a FWS bear biologist monitoring the population (IGBC 2018).

Comment:

- The above Herrero 2002 referenced is 21-year-old information.
- The Agency provides a report regarding FWS biologist injuries, that could pertain to agency personnel, however nothing is provided potentially pertaining to Okanogan County concerns regarding our public and/or family members or livestock, when clearly a quick search can provide information.
- Quick research 2023 MT man mauled by Grizzly hunting deer
 - o "10-2023 Banff, National Park, Canada 2 people and their dog killed, such encounters are increasing"
 - o July 12, 2023 "WY Fisherman Watched Grizzly Bear Chase Down a Helpless Cow"
 - o August 17, 2023 Montana Wildlife Officials killed a male grizzly bear in Southern Park County after it attacked livestock on a private ranch in the Tom Miner Basin. This was the 3rd euthanized of grizzly bears due to cattle depredations after becoming accustomed to cattle food sources.

The agency recognized safety concerns however, only when it aligns with employee safety. The Agency failed to address 2019 comments and concerns regarding our lives, way of life, cattle, which are the same comments during 2023 meetings. The basic quick research I have provided above, SHOULD have been provided by the Agency for our current review and comments.

The Agency failed to meet NEPA requirements.

NEPA requires Agencies to consider the reasonably foreseeable projected lifetime outcome direct and indirect short-term and long-term effects of their proposed actions and reasonable alternatives.

The Agency has failed to provide the public of the long term reasonably foreseeable direct and indirect short-term and long-term impacts to our cattle industry, livestock, workers, and family can/might expect from grizzly bear introductions.

Alternative A: NO ACTION

NO to Section 10(j) ESA RULE needed.

Socioeconomics

The NCE consists of an expansive and largely undeveloped wildland area that spans the crest of the Cascade Range from the more populated, industrialized, urban areas of the Puget Sound region to the more rural, agricultural, and natural resource-based economies of the Okanogan Highlands and Columbia Plateau. The restoration of grizzly bears in the NCE has raised concerns about economic impacts on natural resource-based industries such as mining and logging, specifically regarding the potential for motorized access and road development restrictions in core grizzly bear habitat. Concerns about depredation of livestock or agriculture, such as fruit orchards, have also been raised. In addition, local business and hunting revenues may be affected due to changes in tourism and hunting revenue because of grizzly bear restoration.

Comment: The agency has already stated they have interest in the following from "Trends and Planned Actions" Section of EIS. It appears they already have their decision made to do the following:

- Close roads
- Stop cattle grazing
- Limit public access to public lands
- Stop future ski expansion areas
- "Prohibitions in Areas Designated by Order."
- "Beneficial impacts on grizzly bears could occur from decommissioning roads for a 63 variety of reasons unrelated to grizzly restoration actions in or near sensitive habitat".

The Agency failed to meet NEPA requirements.

NEPA requires Agencies to consider the reasonably foreseeable projected lifetime outcome direct and indirect short-term and long-term effects of their proposed actions and reasonable alternatives.

Alternative A: NO ACTION

NO to Section 10(j) ESA RULE needed.

Okanogan County Wildland Fire Disasters

The agency failed to address the wildland fire disasters Okanogan has had and will continue to have with the poor condition of our national forests and wilderness areas. Some caused by lightning strikes, some human caused. However long term and short impacts poor air quality for days, loss of timber, lack of immediately harvesting timber, creating ecosystem changes, invasive species, loss of wildlife, impacts to wildlife and agency failure to address these issues.

The Agency failed to meet NEPA requirements.

NEPA requires Agencies to consider the reasonably foreseeable projected lifetime outcome direct and indirect short-term and long-term effects of their proposed actions and reasonable alternatives.

Alternative A: NO ACTION

NO to Section 10(j) ESA RULE needed.

The Ministry of Forest, Lands and Natural Resource Operations (MFLNRO) estimated the population in the adjacent British Columbia portion of the NCE to be about six grizzly bears over a decade ago (MFLNRO 2012). Only one confirmed grizzly bear sighting has been documented within the greater NCE during the past decade (IGBC NCE Subcommittee 2016; Rine et al. 2020). The confirmed sighting was in British Columbia. The greater NCE, including its Canadian and US portions, is bounded roughly by the Fraser River on the north, the Okanogan Highlands and Columbia Plateau on the east, Snoqualmie Pass to the south, and the Puget lowlands to the west.

For the purposes of this EIS, the NCE grizzly bear recovery zone within the US portion of the ecosystem is hereafter referred to as the NCE. The US portion of the ecosystem spans the crest of the Cascade Range from the temperate rainforests of the west side to the dry ponderosa pine forests and sage-steppe on the east side.

A grizzly bear habitat evaluation was conducted from 1986 (37 years) to 1991 (32-year-old information) in response to recommendations made in the 1982 (41-year-old information) FWS nationwide Grizzly Bear Recovery Plan. This habitat evaluation and a report by the Interagency Grizzly Bear Committee (IGBC) NCE Subcommittee, concluded that the US portion of the NCE contains sufficient habitat quality to maintain and recover a grizzly bear population (Servheen et al. 1991; (32-year-old information) Almack et al. 1993 (30-year-old information). More recent carrying capacity modeling suggests the most plausible carrying capacity for the US portion of the NCE is approximately 280 bears (Lyons et al. 2018).

Despite the historical presence of grizzly bears in the NCE and the availability of sufficient habitat to recover and maintain a viable population, there is no confirmed evidence of current grizzly bear presence within the NCE grizzly bear recovery zone in the United States (Rine et al. 2020).

There has been only one confirmed detection of a grizzly bear in the greater NCE in the past 10 years, which occurred in British Columbia (IGBC NCE Subcommittee 2016; Rine et al. 2020). Since there has been no confirmed

COMMENT: The agency is making their recommendation on 30, 32, 37, 41, year, outdated information to support THE Agency's goal of grizzly bears. However, a study in 2022 reports 17 known grizzly bears in NE WA actively re-populating themselves without the help of the government. Over the past 17 years Okanogan County has had several very large Wildland Fire Incidents, 2006 Tripod Fire Complex, for example, thousands of timbered acres lost. In 2014 and 2015 WS ST Record setting wildland fires. How can the people that lived through, fought these fires, lost so much from these fires, support a one-sided proposed EIS that it again, points out the Agency's decision has already been made from outdated, pick and choose information that fits their goals, at the price of the people that live here in Okanogan County, that does not adequately address all major issues of Okanogan County?

- Agency failed to mention those specific fire disasters, the long-term short-term impacts and the hundred of thousands of acres burned, pertaining to grizzly bears.
- Failed to mention of the smoke hazard, poor air quality long term ecosystem impacts.
- Agency failed to address Wildland fire impacts past, and future wildland fire impacts, with the poor condition of our forests, beetle damage in our timber, lack of timber harvesting to properly manage our forests, increase in public visiting in and near all public lands, there will be more fires.
- Why did the Agency fail to address reasonably foreseeable direct and indirect long term impact effects of wildland fire incidents in the EIS?

The Agency failed to meet NEPA requirements.

NEPA requires Agencies to consider the reasonably foreseeable projected lifetime outcome direct and indirect short-term and long-term effects of their proposed actions and reasonable alternatives.

Alternative A: NO ACTION

NO to Section 10(j) ESA RULE needed.

Purpose and Need:

As stated by the Agency, action is needed at this time to:

- ♣ Contribute to the restoration of biodiversity of the ecosystem to build ecological resilience and for the benefit and enjoyment of present and future generations of people.
- ♣ Enhance the probability of long-term survival of grizzly bears in the NCE and there by contribute to overall grizzly bear recovery through redundancy in multiple populations and representation in a variety of habitats.

Comment: The "NEEDS" of the people that live, work, have businesses, enjoy various recreational, natural resource, agriculture opportunities, hundreds of local people have stated in 2019, and again during local October 2023 meetings we do not NEED or WANT grizzly bears in Okanogan County, because of the dangerous various threats, loss of lives, livestock, pets, wildlife, the long-term negative impacts to our future generation farming and ranching operations.

- There is no "NEED" for present and future generations. As stated in the EIS, currently there are at least two known locations in the State of WA.

- o North where 17 grizzly bears are crossing back and forth into Canada and WA

- o NE WA where known # (they did not specify #) of grizzly bears are living and some are crossing into Idaho.

- o Both known populations are re-populating on their own without help from the government!

- People can visit these locations to see grizzly bears in their natural habitat at any time.
- They can visit, for their "enjoyment" Alaska, WY, MT, ID, or other states with grizzly bear populations.
- There is NOT a significant NEED for more grizzly bears, in WA ST, specifically Okanogan County.

The Agency needs to listen to our local citizens comments regarding short- and long-term negative impacts, concerns, our comments and the agency's lack of addressing NEPA requirements Okanogan County residents, WILL be impacted directly and indirectly.

The Agency failed to meet NEPA requirements.

NEPA requires Agencies to consider the reasonably foreseeable projected lifetime outcome direct and indirect short-term and long-term effects of their proposed actions and reasonable alternatives.

Alternative A: NO ACTION

NO to Section 10(j) ESA RULE needed.

Objectives in Taking Action:

Provide Pacific Northwest residents and visitors with the opportunity to again experience grizzly bears in their native habitat.

- ♣ Expand outreach efforts to inform and involve the public, and build understanding about grizzly bear recovery.

Comment:

- Pacific NW residents or anybody, can travel to other States, WY, MT, Alaska, Idaho, and Canada, all within a few hours' drive from Okanogan County, WA to "experience grizzly bears in their native habitat."
- NE WA already has known population of grizzly bears; people can travel there to see them in their "natural habitat"
- "Expanding outreach efforts" statement, this process should already be happening by the Agency from states that already have grizzly bears. The Agency can educate and have outreach efforts without placing grizzly bears in Okanogan County.
- Request the Agency remove above language from EIS and Plan, because it can already be provided without grizzly bears in Okanogan County.

The Agency failed to meet NEPA requirements.

NEPA requires Agencies to consider the reasonably foreseeable projected lifetime outcome direct and indirect short-term and long-term effects of their proposed actions and reasonable alternatives.

Alternative A: NO ACTION

NO to Section 10(j) ESA RULE needed.

Issues and Impact Topics

The agencies identified a range of issues and impact topics to evaluate in this plan/EIS to determine the potential impacts on the human environment that could result from implementation of the alternatives. Issues were analyzed in depth for the following impact topics:

- ♣ Grizzly bears
- ♣ Other wildlife and fish
- ♣ Wilderness character
- ♣ Visitors use and recreational experience.
- ♣ Bear-related public and employee safety

- ♣ Socioeconomics
- ♣ Ethnographic resources

Comment:

Agency is not being transparent on the topics and concerns Okanogan County people have been expressing 2019 meetings and again October 2023. They continue to blur the topics into the examples of the above bullet points. People want to know the Agency's decisions specifically identified and then have the Agency specify the impacts so the people can clearly understand what we will be faced with. Agency needs to specifically address how introducing grizzly bears into Okanogan County will impact, (long and short impacts) of:

- Natural resource-based industries
- Agriculture industries
 - o Cattle
 - o Fruit
 - o Farming
 - o Livestock-specific to horses, sheep, goats
 - o Small Family "Hobby Farms"
 - o Loss of Life
 - o Loss of pet, cattle, horse, sheep, goat
 - o Wildlife population decreasing #'s white tail and mule deer, elk small animal populations
 - o Salmon population decreasing numbers. Especially when we all have had to modify, change, adapt to new governmental regulations and policies for salmon recovery.

♣ EIS fails to mention salmon recovery efforts laws regulations and negative impacts of large dominate grizzly can potentially eat up to 30 salmon in one day.

Agency failed to meet NEPA requirements.

NEPA requires Agencies to consider the reasonably foreseeable projected lifetime outcome direct and indirect short-term and long-term effects of their proposed actions and reasonable alternatives.

Alternative A: NO ACTION

NO to Section 10(j) ESA RULE needed.

Invasive Species

The implementation of grizzly bear restoration activities could contribute to the spread of invasive species such as diffuse knapweed (*Centaurea diffusa*) or reed canary grass (*Phalaris arundinacea*) within the NCE. Given the anticipated nature, scope, and scale of restoration activities, it is expected that avoidance of areas with known invasive plant infestations and mitigation measures such as the proper cleaning of vehicles, equipment, uniforms, and footwear would be sufficient to prevent the spread of invasive species. The agencies would locate and use weed-free project staging areas. In addition, they would avoid or minimize all types of travel through weed-infested areas or restrict travel to those periods when spread of seed or propagules are least likely. Based on these conditions, this topic was dismissed from further analysis.

Comment:

The Agency's suggested increase in visitors to see grizzly bears, so comes the increased introduction of non-native invasive species into our county, roads and public lands, that the agency failed to address long term integrated, site specific control methods, utilizing Early Detection Rapid Response fully funded approach.

- Has the Agency performed surveying and mapping of invasive species throughout the boundaries of the grizzly bear zone in Okanogan County?
- Has the Agency prepared NEPA for the identified invasive species control measures?
- Has the Agency prepared Categorical Exclusion (CE) for new invader invasive species treatments within the grizzly bear management zone in Okanogan County to prevent new introduced invasive species from becoming large infestations?
- No specific explanation on how the Agency will address Executive Order 13751 and Executive Order 13112.

The Agency failed to meet NEPA requirements.

NEPA requires Agencies to consider the reasonably foreseeable projected lifetime outcome direct and indirect short-term and long-term effects of their proposed actions and reasonable alternatives.

Alternative A: NO ACTION

NO to Section 10(j) ESA RULE needed.

Environmental Justice

Environmental justice is associated with Executive Order 12898, published on February 11, 1994. This executive order

requires all federal agencies to incorporate environmental justice into their mission by "identifying and addressing ... disproportionately high and adverse human health or environmental effects of [their] programs, policies and activities on minority and low-income populations in the United States" It was determined that while a small number of communities adjacent to the NCE grizzly bear recovery zone may qualify as minority and/or low-income populations, these communities would not be disproportionately affected by grizzly bear restoration because restoration activities would not be focused in these areas. Therefore, this topic was dismissed from further analysis.

Comment: Agency failed to take into consideration that Okanogan County has minority, low-income populations, some borderline poverty line, some below poverty line standards, that utilize Okanogan County public lands with their families because that is all they can afford to do. Releasing grizzly bears into Okanogan County, increasing "high and adverse health or environmental effects to our local low-income and minority people of our county. After the Agency Personnel get done closing more roads, removing cattle, mining, logging and people from our public lands, killing our cattle, our way of life, businesses, our children, and families, from grizzly bear attacks. What's left of us, will be more within the minority and low-income category, or also known as food chain for grizzly bears, which seems to be the main goal for NPS employees pushing this plan.

The Agency failed to meet NEPA requirements.

NEPA requires Agencies to consider the reasonably foreseeable projected lifetime outcome direct and indirect short-term and long-term effects of their proposed actions and reasonable alternatives.

Correspondence: I do not support introducing grizzly bears to the North Cascades of Washington state. I think there will be too many conflicts between humans and bears, especially for ranchers who raise livestock. The plan does not allow individuals to euthanize a bear if it threatens their animals or their safety. This is similar to the problem with wolves in the NE part of the state, which has become extremely problematic for the people who live there. Adding grizzly bears to the north central region of Washington would increase stress to inhabitants of the region.

Correspondence: We are NOT the top of the food chain. Why do you think people have to carry a hand cannon in the wilderness? Talk to someone who has been in Alaska or CA. Grizzlies can smell food many miles away. Do you honestly think they will stay in a designated area and not range further looking for easier food choices? I have had experience with Grizzlies when camping. in CA. in remote areas. This program will endanger anyone with farms, domestic animals, compost pits, smokers, or outdoor and even indoor cooking. This is foolish.

Correspondence: Since studies have proven that Grizzly bears roamed the Pacific Northwest and they have been on the endangered list since 1975 they should be introduced into the North Cascades Mountains. My concern is with the lack of education for those out hiking the Pacific Crest Trail. If a mandatory education program isn't part of this reintroduction then it will most likely be a disaster from the start.

Similarly to how Leave No Trace principles are practiced by many it's those who don't follow LNT that get the attention leaving trash in their wake.

Please consider a mandatory education program for those seeking back country trail permits and upgrade the posting at all WA trailheads.

Thank you

Correspondence: To the PEPC,

I am in full support of reintroducing Grizzly bears to the Cascades. The history of Grizzly bears has given a horrid impression of the species, but as our understanding of the animal and how human involvement impacted them has grown it has become apparent Grizzly bears were never the real problem. Previous attacks made by Grizzlies on humans was mostly due to unsafe food storage practices and harmful human behavior, such as in the case of the Granite Park Chalet in Glacier National Park in the 1960's. The owner of the Chalet at the time created entertainment for the guests by purposefully leaving food waste out and watching the Grizzlies come for the food and fight over it. It was one of the direct causes of the Night of the Grizzlies in 1967, as the bears were offered a more convenient means of food and it drastically threw off their natural hunting pattern. It was after that event that Grizzlies were so demonized, when it was the act of humans that caused the issues in the first place.

As we know more about bear safety practices now, it is not just an option to reintroduce Grizzlies to the Cascades. It's our responsibility to do so, and to not repeat mistakes of the past when we have the knowledge to do better by our beautiful wildlife. Grizzly bears play an important part in the ecosystem and when left to their regular patterns of hunting with no interference from humans, they are far less harmful.

In short, it's been long overdue that we should introduce Grizzly bears back into their home. It's one of the steps to mending the errors of our past, an absolutely necessary one.

Correspondence: I oppose the active introduction of grizzly bears into the North Cascades because of the impact it will have on hikers, hunters, bird watchers, and all of our recreationists. The reality is, despite an active grizzly population in British Columbia (a much larger, less populated place), including bears near the border who sometimes cross into American territory, these bears have not wanted to re-establish themselves here. I have no problem with a natural re-establishment, but I do not support the introduction of grizzlies into this tranquil territory.

Correspondence: I strongly support the National Park Services preferred Alternative C: Restoration with Endangered Species Act Section 10(j) Designation.

This plan will both effectively restore grizzly bears in North Cascades National Park and give people the tools they need to thrive in and around grizzly bear country. Grizzlies belong in the North Cascades, as they enhance the park's ecological integrity and contribute to its wildness.

Grizzly bears play a vital role in maintaining ecosystem balance, cycling nutrients, dispersing seeds, and changing the behavior of species around them. Restoring them would benefit the park and the people who use it. Look at Yellowstone and the return of wolves. I guarantee that the grizzly bear will be able to maintain and restore the natural environment through chain reaction and create a thriving ecosystem for us to lay our eyes upon in the future.

A restored population of grizzlies will boost the park's appeal and attract nature enthusiasts, scientists, and tourists from around the world. This would provide economic benefits to local communities and support the park's mission to protect park resources in perpetuity.

Alternative C, with the 10(j) rule, provides managers flexibility to address community concerns while protecting the grizzly population. It ensures coexistence between humans and bears.

Please consider the positive ecological and economic benefits and support Alternative C. Restoring grizzly bears will secure the park's natural heritage and conserve an iconic species for current and future generations.

Thank you for your dedication to our national parks.

Correspondence: Comments - Grizzly Bear Reintroduction Proposal, North Cascades Ecosystem

I grew up in the Pacific Northwest, hiking and backpacking literally hundreds of miles in the Alpine Lakes Wilderness and the North Cascades. I have lived, worked, and recreated in Southeast Alaska (very much bear country), and currently live on the edge of the Bitterroot Ecosystem Bear Recovery area near Missoula, Montana, where I continue to hike, travel, and recreate -- in bear country. In all these years, I have not had any negative encounters with these magnificent animals. I love bears - grizzlies (also called brown bears in Alaska), black, and polar bears as well. They are beautiful, amazing creatures, and are a vital keystone species for ecosystems throughout the Intermountain West and in the North.

After reviewing the DEIS, I have a couple major concerns regarding the current NPS and USFWS proposals to reintroduce grizzly bears to the North Cascades Ecosystem, which includes some observations from here that I hope may be helpful.

To start, grizzly bear recovery here in the Northern Continental Divide Ecosystem has been an amazing success (and one that will also need constant vigilance to ensure genetic diversity is retained multi-generationally). It's been such a success that per radio collar tracking data, grizzly bears are now wandering close to neighborhoods in Missoula, MT (population 70,000); 2 young grizzlies recently were captured near here who had gotten themselves into an apple orchard (relocated without incident), and grizzly bears have been killed this year on highways just east and north of Missoula (near Bonner, MT and Ronan, MT). This year we are experiencing a troubling uptick in the number of bears that have been killed in self-defense as well as bear maulings and human deaths that have occurred in Montana. Rare incidences, for sure, yet a small trend upward. A local decision was also recently made requiring bear resistant garbage containers for several small communities around Missoula as well as Missoula itself. All indicators that grizzly bear recovery has occurred, as bears begin to push into more urban environments. Many folks here are supportive of grizzly bear recovery (and of course, many are not); it's hard, constant work to not only initiate a recovery plan but also to work with agencies, tribes, local communities, interest groups, recreationists, hunters, anglers, farmers, and ranchers to keep working together to continue making this work.

While there may be quality grizzly bear habitat along the backbone of the Cascades, what is different about the North Cascades Ecosystem is that it is surrounded by over 7.7 million people (with over 4.3 million people from the Puget Sound region alone). No other grizzly bear recovery area has this number of people surrounding its recovery zones. The NCE is also narrow. There is heavy urbanization and growth on the west side of the Cascades, with housing developments continuing to

edge into Cascade Mountain valleys. There is extensive agricultural use on the east side. The NCE is a slender island of habitat surrounded by people - a lot of them. Bears like to roam, explore, and seek out new territory. Young adult bears get pushed out by older bears. Food sources change. Food sources disappear. There's not a lot of "wiggle room" should a bear decide to wander.

In Montana, we have the geographic advantage where prime grizzly bear habitat and recovery areas are still surrounded by extensive front country and foothills that are pretty much undeveloped and wild in character. We only have a little over a million people spread out across the 4th largest state in the Union. Alaska, which has the most grizzly (brown) bears of all, is similar with lots of space for both bears and people to disperse. And even with "all that room" that we have here in Montana, we still have some conflicts.

Even with a target population goal of 200 bears for the NCE, with a shared home range of 50 - 150 square miles for a female grizzly and a shared home range of up to 600 square miles for a male grizzly (University of Montana, Grizzly Bear Recovery Program description), the NCE just doesn't seem like a good option for this type of recovery effort. I would be concerned. For the bears. And for people.

I am also concerned that the DEIS doesn't seem to account for current, real time climate change impacts. While the models used seem to indicate an increase in more quality habitat for bears under different climate emission scenarios, here in Montana, we are already seeing warmer springs, hotter summers, more severe fires, and less snowpack, with impacts on huckleberries and other forage crops, pushing the bears out into rural/urban areas to look for food when berries and other food sources have either dried up or did not come into bloom or occurrence as they typically would.

The North Cascades are undergoing dramatic changes which does not appear to be accounted for in the DEIS - mountain pine beetle infestation has impacted forests (as seen by the mortality along the North Cascades Highway and other parts of the Cascades), and Pacific NW summers appear to be trending hotter/drier as well (as evidenced by large forest fires now on the west side of the Cascades, such as the 2022 Bolt Creek Fire near Skykomish and fires in the North Cascades NP this past summer). Things are changing much faster than earlier models and studies have predicted, even the ones it appears that were used for the DEIS. I am concerned that the amount of quality habitat that would truly be available for a recovering grizzly bear population in the NCE will be significantly less than modeled, resulting in bears moving into urban and rural areas, looking for food.

In many ways I would love to see grizzly bears back in the North Cascades. It is an amazing feeling with a little bit of an edge to know you are walking a mountain with a grizzly.

I am concerned though, that the North Cascades Ecosystem just isn't the "right" place anymore to help restore grizzly bear populations, and even less so as the climate, and the Pacific NW, continues to rapidly change. The NCE is too narrow of a band of land, too close to high densities of people (who likely won't change their behaviors to lessen potential adverse encounters), and it's intersected by major highways that have much higher traffic volumes than we have here in Montana.

If the decision is made to reintroduce grizzly bears to the NCE, I would recommend that, right at the start, the federal agencies, the State of Washington, the respective tribes, and concerned citizens, consider proactively setting a "cap" on the grizzly bear population at a level that is genetically viable and sustainable within "real time" information on quality habitat in light of climate change, so that bears are not being "pushed out" into populated areas or areas with large ranching and farming operations. Instead of allowing the population to eventually expand to fit available habitat, as is proposed in the DEIS, I would offer that keeping population levels at a "less than the maximum" and/or "less than optimum" range could be an approach that could work better and be quicker at adapting to landscape scale effects from a rapidly changing climate.

If grizzly bears are to be reintroduced to the NCE, it will also be vital for everyone to work together, with a willingness and openness to continually adapt as you go. Ongoing communication channels that build trust, social acceptance, and support for having a large, top of the food chain carnivore as your new neighbor will be essential - and hard work. With this calendar year being the hottest on record, world-wide, and climate change happening rapidly, how we've restored and managed for endangered species in the past, in terms of both species recovery as well as working with communities, cannot be how we do so in the future. We must come at this differently. In a big way. Getting all communities of interest on board - collaboratively and for the long term - will be essential to the success of this effort, regardless of the amount of habitat available for grizzly bear recovery in the NCE.

Thank you for your consideration of my comments.

Sincerely,

Correspondence: I have been a Seattle resident since 1982, and an avid hiker for many years. I base my comments in part on having lived in the Canadian Rockies for 4 years (Banff & Canmore, Alberta), my understanding of the proposals & information from several articles (cited below) about experiences with grizzlies in the US where they currently reside.

I'm only in favor of option (A). The proposed reintroduction is based on "best case" scenarios of adequate habitat, which cannot be reasonably predicted based on climate change variables. The extended periods of drought and high temps that we've experienced over the last several years have made it very rough for berries in the expected grizzly range.

Consider that the Greater Yellowstone Coalition felt it necessary to raise more than twice as much money as it had ever raised in a two-year period in order to acquire just under 1600 additional acres to protect the griz currently subsisting on over 2.2 million acres, just to protect them from a proposed mine.

https://www.nytimes.com/2023/10/16/us/yellowstone-gold-mine-grizzly-bears.html?unlocked_article_code=1.30w.Gi0r.FOBwWn-1tLI3&smid=url-share

Compare that to NCNP (505K acres) contingent with Ross Lake NRA (117K acres) and Lake Chelan NRA (62K acres). Subtract out the high elevation areas of the NC that are not habitable for bears. More importantly, grizzly populations currently thriving in the US are doing so in states with very low population density outside of the bears' protected ranges. Yellowstone is one. Glacier NP is the other, and they're having trouble even in Montana. They are thriving, yet moving out of the park in increasing numbers, with a concurrent rise in bear/human confrontations, as cited in the NYTimes article,

"Grizzlies are coming to town. Can the West live with them?" (please google it)

I might also add that in the last two decades (if not longer), Banff National Park has gotten extremely "militant" (for lack of a better word) in keeping humans away from grizzlies, as visitation to the Canadian mountain parks has exploded. Depending on the area, it's not uncommon for wardens to close off entire valleys to hiking if a single grizzly is known to be in the area, or limit visitation to parties with a minimum of 4-6 hikers. This is in areas where you used to be able to hike wherever and whenever you wished.

Central Puget Sound grew by 600K in the last 10 years, and is currently at 4.3M. Future growth will continue to expand into counties adjoining the North Cascades (Skagit, current population 130K and Whatcom, 234.5K).

The grizzly is a magnificent animal. I wouldn't like to see the griz managed the way wolves are now, and worse. The animal always loses when they "get out of line", I understand that the Canadians are proceeding with their own plans for the Canadian North Cascades. If they include some highway bridges for critters and a few of their bears manage to get across the border and thrive, great. But I can't support reintroducing them down here, where the deck is stacked against them, regardless of what the proponents say, whose reports, I suspect, are loaded with confirmation bias.

Thanks for the opportunity to comment.

Correspondence: If you've followed the reintroduction of wolves in Yellowstone, you know that these larger keystone species are vital to the overall health of the ecosystem. In the absence of grizzlies, we have seen an increase in the deer population, coyotes seem to be everywhere, etc. At this point, the health of the North Cascades is dependent on human interaction, because it was humans that removed grizzlies to begin with. We are talking about a very small number of animals in a very large amount of space. Thus, I do not foresee them being an issue for humans. Think about how many black bears we have around and most people coexist peacefully with them. Don't keep food outside, be aware of your surroundings. Essentially, if humans are "bear aware"; there should not be conflict.

Correspondence: Just say NO to the reintroduction of brown bears to the North Cascades Ecosystem (NCE). Here's why ...

I am Western Washington State-born and raised. I have ridden many trails, fished, hunted, and climbed many mountains in

my time. I have worked in another state for the last few years but I am retiring to Washington next year, where some of my family lives in the North Cascades.

I lived in Western Washington as a child at a time when one of the last great brown bears lived on the western side of the Cascades. My guess is the people who want to reestablish numbers of the magnificent brown bears in the NCE have never actually lived day-to-day with brown bears (or cougars, or wolves).

My experience is brown bear behavior is much more aggressive than black bears, and also I note the NCE is not a zoo or a wildlife park. Additionally brown bear populations exist in the lower 48 and elsewhere, they are not facing extinction--of course they're not or there would not be any to bring to the NCE. They had their time of massive numbers in history. It has been stated that brown bears were hunted for the fur trade in the late 1800s; but, they were killed in the decades that followed because they are a threat to humans--of course they are or they would be as common as black bears.

I am thankful to God, my horse, and the circumstances on the day my horse and I lived for me to tell about my last encounter with a brown bear as a child. No less terrifying were earlier encounters when the bear hunted our farm, despite brown bears not being territorial and it living in over one thousand acres of wetlands and forest with abundant huckleberries and game. My experience then and later is that brown bears are not frightened by humans at all, and they consider livestock, pets, and humans preferred food options.

For these reasons, I am completely opposed to the increasing of brown bears by reintroduction of ANY brown bear species anywhere in Washington State under ANY federal, state, local, or tribal rule, and under ANY federal, state, local, or tribal proposed "management" plan.

If you are reading this and believe opposition to these proposals is about ignorance, politics, or land-greedy ranchers, I encourage you to speak with your elderly who remember the brown bears and to your rural neighbors who live with brown bears, and carefully consider their comments.

The childhood experiences mentioned above were in the early 1960s in the area that is now Samammish, Washington--it wasn't called Sammamish then. No thinking person would want the brown bears reintroduced into their natural habitat in Sammamish simply because the brown bears once lived there, part of their original habitat preserved as Soaring Eagle Regional Park. Nor for the same obvious reasons should brown bears be reintroduced or their numbers intentionally increased in the NCE or anywhere else in Washington state.

Correspondence: No, do NOT reintroduce Grizzlies to the North Cascades.

Background to comment: I grew up in Brewster,WA in the foothills of the North Cascades. We spent our family's recreational time packing horses and hiking in many areas from the Paysayten Wilderness to the head of Lake Chelan. We felt safe-only scanning for rattlesnakes. Black bear were shy and posed virtually no threat.

Increased Arming the Wilderness to stay safe: Grizzly bears' more aggressive nature and strength pose a real threat to the safety of the Cascades. I have never wanted to pack a gun into the woods, but with the risk of encountering a grizzly would change safety for children, hikers and even horseback riders.

Too much increased danger already: Wolves reintroduced to the Blue Mountains are endangering livestock. It's hard to take our children to play freely in the mountains because of the danger from Cougar and wolves. Cougar attacks are more frequent-it was only folk lore to Okanogan Valley in the 1920s -1970's.Infact, there is a 1930's plaque by Rattlesnake Lake in Brewster noting the site of a boy eaten by a cougar. It was a tale that my dad loved to tell because if was unbelievable.

Summary: I want Washington to keep its safe and accessible beauty of spirit. Please do not alienate people further. Thank you for taking my comments.

Correspondence: I am in favor of grizzlies naturally repopulating the North Cascades without any interference from humans or government agencies. This organic approach allows any migrating grizzlies to transition more smoothly into a new territory where they can acclimate to the new environment's food and denning resources, scope out ranges and eventually develop a healthy, diverse gene pool. In addition, migration ensures they will have automatic ESA protection. The proposed alternatives to migration would rely too strongly on disturbing the wilderness and (more concerning) manipulating grizzlies from established populations to relocate them and risk unintended harm, consequences and questionable outcomes. As my boss would always say "slow and steady wins the race". Thank you for your consideration.

Correspondence: I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C: Restoration with Section 10(j) Designation. Alternative C is the best choice for bears and the people who live in and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you for taking the time to keep our North Cascades wild!

Correspondence: Grizzlies were part of the ecosystem, and undoubtedly, the system would work better with them back in it.

That said, there will have to be significant education of humans in how to coexist with grizzlies. And, grizzlies will need more salmon restoration to feed them.

It should probably have a permit for those humans that want to go into grizzly territory. The worse thing for bears is to associate humans with food. And that takes some specific actions on humans to prevent that

Correspondence: I wanted to take this moment to express my strong opinion that grizzly should not be reintroduced to the Cascades in the Pacific northwest.

I've been in Washington state now for over 20 years and spend a great amount of time in the backcountry every year. Adding grizzly will create a very high danger risk for humans who enjoy Backcountry activities such as backpacking camping hiking mountaineering horseback riding fishing and hunting. There's a great difference between the way that black and grizzly bears interact with humans, their aggression, and their level of danger.

By introducing grizzly bears to the Cascades you will be directly responsible for the human deaths that we will result from this action.

Please do not proceed with this reckless plan.

Sincerely,
Concerned citizen of Wa State,

Correspondence: Good evening,

I am writing in opposition to any plans to reintroduce Grizzly Bears to the North Cascades, and believe ALTERNATIVE A: NO ACTION is the best option for a variety of reasons.

First, I am very concerned about the inevitable human/bear interactions that will occur, and the negative consequences for both. Hiking and outdoor recreation has become incredibly popular in Washington State, especially in the last five years. In some of the most popular areas, thousands of people will enter a wilderness area or region of the National Park on a single day, and each year this leads to problems. For example, this past summer the Cascade Pass trailhead area had a bear that with a food reward was destroying cars. A second incident with a bear destroying a tent to get food led to the closure of a backcountry zone. These incidents show that outdoor recreationalists are already not behaving smart to keep themselves and bears safe, and I fear for the incidents that will occur when it is a Grizzly instead of a black bear. The recent deaths in Canada highlight the worst possible outcome of the interactions for people and the bear.

Second, the bears will limit access to backcountry areas due to concern over the bears. The North Cascades in Washington are a unique place to hike because with only the presence of black bears, I and many of my friends feel comfortable hiking alone or in a very small group during the day. This would change with the presence of Grizzlies, and I would be very sad to lose this access. Not everyone can find a group to hike with, and this will exclude many from the region.

Third, Grizzly bears are not a keystone species for this ecosystem, and as a result there is no strong ecological reason to reintroduce them.

Fourth, Bears are already present in the regions north of the Cascades, and will make their way south if they want to.

Fifth, human presence in the North Cascades is only going to increase with our rapidly growing population, popularity of hiking, and increase in visitors from out of state, and none of these people are prepared to recreate responsibly in Grizzly territory. Many hikers right now can't even be bothered to dispose of their poop and waste properly or follow Leave no Trace principles, and are unlikely to be careful with food and scented items, putting themselves and the bears in harms way. The North Cascades are simply too crowded and the recreational population too unaware/ uncaring to change behavior enough to make a reintroduction plan sensible in any way.

I can only see sad outcomes if Grizzlies are reintroduced, especially for the bears, which is why I advocate for the No Action Alternative.

Sincerely,

■

Correspondence: I am writing to express my deep concern and opposition to the proposed introduction of grizzly bears in the Northern Cascades of Washington State. While I understand the importance of biodiversity and conservation efforts, I believe that introducing grizzly bears to this region may have severe consequences that need careful consideration.

The safety of local communities must be paramount in any decision regarding the introduction of large predators. Grizzly bears are known to be powerful and potentially dangerous animals. The presence of such apex predators in close proximity to dense human settlement raises legitimate concerns about public safety. Incidents of human-wildlife conflicts, though rare, can result in serious consequences for both humans and bears. We must prioritize the well-being and security of the residents who call the Northern Cascades home.

Additionally, the potential impact on livestock and agriculture cannot be ignored. Grizzly bears are omnivores and have been known to prey on livestock, particularly in areas where natural food sources are scarce. The introduction of grizzlies in the Northern Cascades could pose a significant threat to local ranchers and farmers, whose livelihoods depend on the well-being of their livestock. This could lead to increased financial burdens for these individuals and negatively impact the region's agricultural economy.

Moreover, the Northern Cascades are a popular destination for outdoor enthusiasts, hikers, and campers. The introduction of grizzly bears could alter recreational activities in the region, deterring people from enjoying the natural beauty of the area due to safety concerns. This could have a ripple effect on tourism, which plays a crucial role in the local economy.

The ecological impact of introducing grizzly bears also raises questions. While proponents argue that reintroducing grizzlies will restore a natural balance and contribute to ecosystem health, the reality is that Western ecosystems are complex and dynamic. The introduction of a top predator can have unforeseen consequences on prey populations, plant life, and other species in the area. The Northern Cascades' delicate ecosystem should be thoroughly studied before implementing such a significant change.

While I strongly support conservation efforts and the preservation of biodiversity, I vehemently oppose the introduction of grizzly bears in the Northern Cascades. The potential risks to public safety, agriculture, tourism, and the local ecosystem demand careful consideration. I urge you to prioritize the concerns of the communities directly affected by this proposal and conduct comprehensive studies to assess the potential impacts before making any decisions.

I trust that you will consider the diverse perspectives surrounding this issue and make decisions that prioritize the well-being of both the human and natural communities in the Northern Cascades.

Correspondence: I strongly support the grizzly bear restoration plan for the North Cascades. This is an important part of the former range that still contains large areas of wilderness that could support a breeding population of grizzly bears. It will undue a historical wrong, increase the wildness and ecosystem function of the North Cascades, and contribute importantly to the conservation of an endangered species. I also support managing the re-established population as non-essential to give management flexibility to ranchers and others who would be most impacted by the reintroduction.

Sincerely,

██████████

Correspondence: As an avid backpacker for the past 50 years, I am totally against the Grizzly Bear Restoration Plan. Over the 50 years I have stayed away from any area that may be the home for grizzly bears. The animals are TOO dangerous to be located near humans. Humans can't be trusted to take all of the necessary precautions to avoid the grizzlies. I've encountered black bears during my lifetime, but have avoided any serious issues with them.

If the grizzlies are introduced, human deaths will eventually take place. How many deaths will it take to reverse a possible restoration?

Please say NO to the restoration!

Thank you very much.

Correspondence: I am adamantly against the reintroduction of Grizzly bears into the North cascades. To release another Apex predator in the an ecosystem whose ungulate numbers are already severely depressed, would undoubtedly lead to conflict with local ranchers, farmers and other residents of local mountain communities. There is also an added risk to those of us who recreate in these mountains with our families and young kids. If the habitat and prey base is sufficient for a larger population of Grizzlies, then they will reestablish their population there without human involvement. If, as I believe, it is not, the addition of dozens of bears will only lead to problems. Let nature takes its course.

Correspondence: Plan C would be my preferred choice as I'd love to see endangered wildlife restored, however, there are plan gaps, which sway me toward option A, take no action, until these are addressed: education of the public and food storage options have not been given enough funding or fully detailed in plan yet.

1. Education -

Included in the draft: A. USFS staff time would likely be needed during the primary phase to assist with project implementation and to educate the public

How much projected time? In what ways -- just signage? Does USFS staff actually have the time and staff to do so?

On page 257, education is a line item of \$10-15,000/year.

2. Food storage -

On page 257, prevention supplies are listed at \$25,000/year. Does that include, in plan: bear-resistant trash receptacles and bear-resistant food storage lockers in NPS and USFS campgrounds ?

How many campgrounds do not already have bear resistant food storage lockers? What is the cost to implement? Does this plan account for that cost? Can you clarify? If the average cost of a food locker is \$1500, that's 16 a year.

What is the detailed plan to ensure all campsites and backcountry camping facilities have appropriate food storage?

Today this is already in a poor state with lack of funding to the NPS and USFS. This past year, there were closures due to food conditioned bears. A lot of the public cannot be trusted to keep food secure.

<https://www.columbian.com/news/2023/aug/22/lax-food-storage-gives-rise-to-bear-problems-in-north-cascades-national-park/>

When/how often does NPS/USFS audit campsites for maintenance of existing bear wires, poles or other? Please take example of McAlester Lake camp site. I was there this past summer and the advertised bear wire in the permit was strung across two trees and was able to be reached by a 5'8" person standing on the ground. These backcountry camp sites aren't in the condition to support keeping grizzlies safe if they can easily access food.

In plan, page 125:

In addition, some of the backcountry campgrounds are equipped with poles or wires, provided for hanging food out of the reach of bears (NPS 2021b). Not all backcountry campgrounds are equipped with bear-resistant infrastructure; however, when campsites are moved or upgraded they are designed to have separate cooking and food storage areas roughly 100 feet from tent pads (NPS, Braaten pers. comm. 2023h).

In plan, page 130:

Current management actions, such as providing food lockers and bear-resistant waste receptacles and visitor education on backcountry food preparation and storage, contribute to maintaining the safety of both grizzly bear and human populations.

Other questions that seem like gaps in the plan:

1. The Yellowstone population grew to 1000+ bears in 40 years' time. Why would the North Cascades bear population only grow to 200 bears in 60-100 years' time? (p. 88)

2. Population growth and popularity of climbing/thru-hiking/trail running.

There is information in the plan with the existing regional human population but no scaling on growth of what these cities/town would look like in 60-100 years.

PCT thru hikers, 1000+ completed the trail in 2019. That does not account for how many start each year and how many day hikers it gets. Was PCTA consulted in this plan? Were other tourism or outdoors groups consulted in this plan?

In plan: Overnight backcountry stays in wilderness increased gradually from 2010 (1,316 stays) to 2019 (2,744 stays) (NPS 2023c) ...

from 2021 to 2022, the park complex saw a 29% increase in backcountry campers (NPS 2 (P 112/pdf 136 backcountry visits)

What is the projected growth of visitation as population grows? Has that been accounted for?

As written, this plan does not detail how education would be spent nor how much time rangers and staff would need to educate the public, which is a key component of keeping both grizzlies and humans safe.

This plan does not detail how it would ensure proper food storage mechanisms at all areas. What is the most effective method of food storage in bear country?

I've seen how many visitors treat food storage in leaving wrappers, or not hanging food at all. My concern is that this plan has gaps in how to keep grizzlies safe from being food conditioned because of careless humans. A lot of care and attention was put into this research -- so much planning in helicopter rides, noise, other protected animals, etc. However, I don't believe the plan is ready in the gaps highlighted above haven't been fully addressed or at least communicated out. Thank you and I hope these are being addressed in more detail.

Re: Public Comment on Draft Grizzly Bear Restoration Plan / Environmental Impact Statement, North Cascades Ecosystem and Docket #FWS-RI-ES-2023-15310074

Dear Superintendent Striker and Ms. Velasco,
Please accept our comment on both the Draft Environmental Impact Statement (DEIS) concerning restoration of the grizzly bear to the North Cascades Ecosystem (NCE) and on Docket #FWS-RI-ES-2023-15310074. We strongly support the effort to restore grizzly bears to the North Cascades Ecosystem as a part of the recovery of this species required by the Endangered Species Act. The designation of the NCE as a recovery area was made 32 years ago. Proposed Alternative C would bring up to 25 non-problem grizzly bears into remote areas of the North Cascades over the next decade to be managed as an "experimental population". We encourage you to choose Alternative C in the DEIS, but with changes to improve

the 10(j) regulation as discussed below. Please take this opportunity to bring back the grizzly bear to the NCE where it once thrived and ensure the success of its restoration.

We are recreational visitors to public lands.

In the past we have hiked, backpacked, kayaked and tent camped in grizzly bear habitat in Denali National Park, Glacier National Park, Yellowstone National Park, Banff and Jasper National Parks and in the Great Bear Rainforest in B.C. In four of these places we have seen and heard grizzly bears and have also seen evidence of their presence (scat, paw prints in riverbeds and the like). Over the years, park(s) staff and biologists in these places educated the public, including ourselves, on human/bear interactions and how to keep ourselves and the bears safe in their territory. At present we camp, hike, photograph and explore the North Cascades National Park and the nearby National Forests, primarily in Skagit, Whatcom, and Okanogan Counties. Restoration of a species in a habitat that it once occupied is key to its successful recovery. The NCE is one of the few remaining places where it is still possible for your agencies to meet the Act's requirements for this species.

The grizzly bear has occupied North America, including the North Cascades.

The grizzly bear is known to have occurred in North America for thousands of years. There is ample evidence that historically it also occupied the North Cascades. This wild icon is an important part of the natural heritage of the Northwest and is of particular importance to the Tribal cultures in this area that regard the bear as a spiritual animal and deeply respect its presence and right to exist. Yet, the species was lost during the 19th and 20th centuries as the western expansion of European trappers and hunters engaged in an industrialized fur trade, killing the bears for their fur. Additionally, fearful settlers exterminated bears. Eventually NCE grizzly bears were extirpated. One Tribal speaker on a recent documentary about the American Buffalo, aptly labeled the result of European expansion across the west "the largest destruction of wildlife in the modern world." Like the Buffalo, wolves, raptors and other wildlife, the grizzly bear became a victim of this tragedy.

We are keenly interested in the restoration of a creature that we know contributes to the health of the ecosystem. The NCE contains over 6 million acres that will support the bears. Among other things, the bear's foraging behavior will help the biodiversity of the ecosystem's abundant native wildlife, plants and landscapes.

We believe that grizzlies will not be able to repopulate the North Cascades Ecosystem "naturally" on their own as some people argue, perhaps in their effort to discredit the need for restoration. There are significant barriers between the NCE and areas populated by grizzlies in the United States and Canada. Although there are unconfirmed reports of an occasional bear in the NCE, biologists have not found evidence of a reproducing population in the North Cascades in more than 30 years of searching. And as your DEIS states: "There has been only one confirmed detection of a grizzly bear in the greater NCE in the past 10 years, which occurred in British Columbia (IGBC NCE Subcommittee 2016; Rine et al. 2020)."

We support Alternative C, but request changes to improve the proposed rule.

We understand that Alternative C would apply ESA §10(j), Experimental populations. We agree with the goal of your 10(j) regulation to: "support reintroduction and recovery of grizzly bears within the NCE and provide the prohibitions and exceptions under the Act necessary and appropriate to conserve the species within a defined NEP area." We support your 10(j) map that envisions a future expansion of grizzly bear populations into Zone #2 that may create connectivity between populations in the U.S. and Canada if corridors can be developed and bear habitat is protected. This contributes to species conservation. This would contribute to species conservation.

The 10(j) regulation as proposed would allow the federal agencies involved greater flexibility to manage the bear population around the issue of human-bear conflicts should these occur. But given the sad history of the species in the U.S. and the fear and anger that it can provoke in some hostile persons we are concerned about designation of the NCE grizzly bears as a "non-essential population" (NEP) (thus allowing the species here to be treated as a "species proposed to be listed" rather than allowing it to maintain its threatened status) in light of one troubling aspect of your proposed 10(j) rule: conditioned lethal take authorization.

Once back in the "proposed" category under a §10(j) rule the NCE grizzlies will lose other ESA protections including the more restrictive prohibitions of ESA §9 currently applicable to the species and, except for the within the National Park, the consultation requirements for activities on federal lands and federally funded projects in §7 (substituting conferring on such projects and FWS issuing "advisory recommendations). There can be no designation of critical habitat. Once finalized, a provision of the 10(j) regulation may be difficult to modify by amended rules. Therefore, the

adopted provisions of a 10(j) rule in 50 CFR §17.84(y) should be drafted with the upmost clarity and specificity as well as certainty about impacts on the species.

In this case, the change in ESA status is for the purpose of reducing “adverse socioeconomic impacts” in the NCE according to the DEIS. We understand your goal to address local communities' concerns and desire for management certainty. Your rule would help achieve that goal. However, we worry whether this re-designation will sufficiently protect the species and support the success of its NCE reintroduction particularly, as you say, the primary threat to the grizzly bear is human-caused mortality.

Conditioned lethal take authorization is unnecessary and should be eliminated.

We oppose the proposed 10(j) regulation's time-limited “conditioned lethal take authorization” permit provisions for livestock owners, other private landowners and commercial interests in Management Zones 2 and 3, §17.84 (y)(4) and (5). Simply put, this part of the regulation goes too far. Of course, people are and should be allowed to kill bears in self defense or in defense of others. But the lethal take provisions for private parties may result in unnecessary killing or injuring bears in contexts other than that of a human self-defense or defense of others. Livestock, agriculture, beehives, and other property loss can and should be addressed by compensation for the loss through a variety of already existing government and non-governmental organization (NGO) programs. Bears who may become “repeat offenders” damaging livestock or property or who become dangerously habituated to human settlements or activities must be managed by professional, qualified and authorized agency staff not private landowners and commercial entities. Private landowners may commit a “mistaken-identity” kill and may even injure rather than euthanize a “conflict bear,” making a dangerous situation even worse.

Please improve the 10(j) rule by only allowing trained, experienced and authorized Service, federal, state or Tribal experts to be entrusted with any lethal removal of “conflict bears” for not only Management Zone 1, but for Management Zones 2 and 3 as well. Those personnel, not private parties, should manage this important aspect of NEP bears' lives and death, humanely euthanizing the “right” conflict bear and only after non-lethal efforts have failed.

The provisions for conditioned lethal take permits are unclear.

As currently written, the proposed regulation is unclear about whether a conditioned lethal take permit for a private party must be preceded by concerted efforts to remove a bear by other means: deterrence (as defined in proposed rule) or live-capture, transportation and release to a remote area by authorized agency personnel. See your discussion in “Management Zones Proposed Management Actions,” p. 62710 and Relocation of Bears, p. 67216. To improve the rule, please clarify whether such non-lethal efforts would be required prior to issuance of a lethal take permit for a private party, as they most certainly should be.

The rule as proposed also appears to allow private livestock owners rather than agency personnel to make a determination about whether it is “not reasonably possible to otherwise eliminate the threat by nonlethal deterrence or live capturing and releasing the grizzly bear unharmed in a remote area.” Conditioned lethal take (y)(4)(ii)(B). Livestock owners are not trained or qualified to make such an impartial determination. Compare to the Conditioned lethal take provision in Zone 3 (y)(5)(ii)(A), in which the Service or authorized agency is to make this determination. Moreover allowing a livestock owner to make this determination would undermine the enforceability of the restriction should a violation of the provision occur. The provisions should be the same for both Zones 2 and 3 - only authorized Service, federal, state or Tribal personnel should make this determination. Please revise (y)(4)(ii)(B) accordingly.

Does “humane manner” for Zones 2 and 3 (y)(4)(ii)(C) and (y)(5)(ii)(C), mean “done in accordance with Service-approved interagency guidelines” as set forth in (y)(3)(vi) for Management Zone 1 or is a “humane” determination to be left up to private parties? There are likely vast differences of opinion among those private parties about what constitutes “humane.” Because of the importance of the humane manner requirement for lethal takes of these animals in Zones 2 and 3 we request that you add “done in accordance with Service-approved interagency guidelines” to (y)(4)(ii)(C) and (y)(5)(ii)(C) or other clear guideline or standard. Otherwise, as with the provisions discussed in the paragraph above, “the taking is done in a humane manner” may be unenforceable.

Resolution of whether these restrictions as proposed are enforceable when applied to the facts of a potential enforcement case may be left for a decision maker in a legal proceeding, but meanwhile a bear mistakenly identified or true “conflict

bear" has been lost. As the DEIS says, the additional bear mortality under Alternative C (versus Alternative B) from human-bear conflicts is "difficult to quantify." Since this is the case, why add the wild card of private party lethal take permits, especially with ambiguous provisions? Uncertainty about how these permits might impact bear mortality in the recovery program should be addressed in favor of the species.

Restoration can work here.

We have followed the plight of the grizzly bear for many years now and have studied it enough to know restoration is working in other places and have previously submitted comments to you in favor of returning it to its home here in the NCE. We believe restoration can work here. We have carefully considered application of a 10(j) regulation to the NCE. We believe that Alternative C presents the best alternative for reintroduction in the NCE, but please make the changes to the 10(j) rule that we have requested to clarify the regulation and avoid unnecessary bear mortality. Please seize this opportunity to right the wrongs of the previous centuries that resulted in near extirpation of the grizzly bear in the wild and led to its listing as threatened under the ESA. Please act expeditiously to begin restoration of the grizzly bear to the North Cascades Ecosystem. Thank you for your attention to our comment.

Sincerely,

[REDACTED]

Correspondence: I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C: Restoration with Section 10(j) Designation. Alternative C is the best choice for bears and the people who live in and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you for taking the time to keep our North Cascades wild!

Correspondence: I am writing to endorse Alternative A - no action with respect to grizzly bear re-introduction in the North Cascade Ecosystem. While I recognize these lands are historic grizzly areas and they play role in the natural ecosystem, as an avid visitor to the backcountry and one who plans to bring young children to these areas, I cannot endorse a human-driven re-introduction scheme. Human-bear interactions while rare do occur, and are occurring at higher rates. Re-introduction of grizzlies into the Cascades would change the risk-benefit calculus of recreating in this area.

Furthermore, the costs of this project also seems to outweigh the benefits. Shouldn't the funds go to better managing and increasing existing grizzly populations rather than re-introducing to an area that hasn't had a significant population (or any population of grizzlies) in decades?

Correspondence: I have spent my life in the woods and backcountry of the eastern cascades as a pack outfitter, rancher and for recreation. My past also includes stories and history of those way older than me. With the exception of one instance, I never saw, whitenesses or heard a story of a grizzly in this region. I have also never heard of some plot to exterminate, hunt or eradicate grizzly bears in the past history. Maybe that was because they were not there. This effort to introduce grizzlies into the eastern cascades because they might have been there is based on a false premise that they were there. Wildlife biologists have spent decades trying to locate or find traces of grizzlies in the eastern cascades to justify a reintroduction program. It borders on silliness.

We, the public, have enjoyed generations of experiencing wilderness places without the fear of a possible dangerous encounter of a bear. Now that experience is being jeopardized because of a plan based on some fantasy. We that have to live and work with this increased risk are the ones that pay the price, no the far remove supporter that think "Oh how nice it will be to be wild".

I am against the proposed grizzly bear reintroduction program and hope common sense will prevail.

Please withhold my comments from public review

Correspondence: I am writing in support of the draft plan to restore grizzly bears to the North Cascades Ecosystem. Grizzly bears are native to this ecosystem and they were a keystone species here. Their loss means a loss for the ecosystem as a whole. Humans are responsible for this loss, and we should correct it for the benefit of the land, for the indigenous people who valued them as co-inhabitants, and for our children who deserve to inherit an intact mountain wilderness with majestic animals in it so they have the opportunity to pass it on as well.

I have been hiking the North Cascades for 30 years. There is ample room for grizzlies and people to coexist. It seems to me that the support of the First Nations people of the Cascades is already there. The goodwill that reintroduction would generate, the benefits to the ecosystem (distributing seeds, creating and maintaining alpine meadows, maintaining prey populations) and also the tourism and recreation benefits outweigh any problems that might arise--which could be easily handled, as we've seen in Yellowstone, Alaska, and elsewhere.

As a parent, I would love to be able to take my kid hiking and see a grizzly bear. They are an important part of natural heritage and our regional culture, and the North Cascades are incomplete without them.

Correspondence: Grizzly bears have been naturally migrating back into Washington and already exist in the state. They do not need to be transplanted unless there is a requirement that they are open to hunting like black bears. Oregon and California could use them instead as they used to reside in these states before they were exterminated. California has the grizzly on their state flag, please help bring them back there.

Correspondence: I support restoration of the natural ecosystem of the North Cascades including the reintroduction of Grizzly bears. I also have faith in the ability of humans to adapt to that reintroduction. People in those states where grizzlies currently occur have (for the most part) learned to coexist with them, just as Indigenous people did for millennia.

That said, reasonable compensation should be given for any unpreventable loss of livestock, etc. to grizzly predation.

Correspondence: Howdy again

Another item in the Draft proposal that raises questions is exactly what the WDFW will be doing about grizzly issues off of Park Service lands, especially some years from now.

RCW 77.12.035 is accurately quoted in the draft and I believe that WA state Attorney General has interpreted that statute for the WDFW.

Two things to keep in mind. The first is that the AG interpretation, though likely is correct, has at least a small chance of not standing up. The AG, though usually correct, does now and then loose in court. One interpretation by opponants of reintroduction, is that the statute may prevent WDFW of being involved with any grizzly originating from out of state after being transported to the state, even many years after reintroduction. You need to have a plan in place for US Fish and Wildlife folks to jump in and take care of problem grizzlys on Forest Service and private land if WDFW gets its hands tied.

The second point is that the WDFW may not have the authority forever of dealing with grizzlies. There may be staffing, budget issues reducing their ability to respond. Also, laws and statutes may change, reducing or eliminating WDFW authority to deal with grizzlies. Solution is same as before in you need a fall back plan for someone other than WDFW to deal with grizzlies on Forest Service and Private lands.

Another issue is what exactly will the WDFW will be doing with the public about grizzly issues on private land. When Leavenworth had their black bear problems last year, the WDFW was unwilling to get involved until after the bear mauled the lady in town and put her in the hospital. I sent the WDFW two emails with concerns about garbage cans on several area roads being dumped overnight and garbage scattered. Waste Mgt is the garbage hauler and they sent out mailed flyer recommending that folks put their cans out the night before as they would start their pick up rounds at 5AM. About half of folks had their cans out at least one night before pickup. The WDFW did not respond to my first email. They did respond to my second email, but said that garbage cans being dumped by bears was not their problem and that I should report the problem to the County.

NOTE: I can confirm that several of the dumped garbage cans did have bear tracks around them, so were likely not dumped by dogs, people, or car bumps. Two of my neighbors suggested that they saw the problem bear in the vicinity of the dumped cans, so it seems that the bear became use to garbage foraging. (The bear had one of its cubs being distinctive white or blond, so it is likely the same bear that mauled the lady)

I believe I still have the WDFW reply to my garbage bear concern and may be able to forward it to you if you provide email address.

You need to be specific as to who is going to do what in dealing with grizzly/human linteraction.

Reply requested

Thank you

Correspondence: I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C: Restoration with Section 10(j) Designation. Alternative C is the best choice for bears and the people who live in and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you,

Correspondence: As a park naturalist and a former bear specialist, I welcome the opportunity to comment on this proposal. Grizzly bears are apex predators and are also an umbrella species. This means that by protecting land and wildlife habitat for grizzlies, we also protect this same habitat for a host of other animals as well. In short, this is a good idea and an excellent example of good wildlife conservation. For many people, grizzlies are also the very symbol of wilderness both here in Washington state and nation-wide. While I am aware of concerns by some, there are many ways to mitigate any potential problems. Other states have learned how to have grizzly bears and manage them with minimal problems. We can do that here too.

I strongly support the proposal to bring in additional bears to supplement the handful of bears already here in Washington. I reject the no-action alternative. Based on surveys I have seen, I believe that the vast majority of Washington residents want to see grizzly bears continue to live in Washington state. I strongly urge you to consider one of the proposals to supplement the grizzly bear population here in Washington state.

Correspondence: I am opposed to the reintroduction of grizzly bears into the state of Washington. The grizzly bear will kill many other animals and even other bears. It will be a certain danger to farmers and their livestock. Also, the grizzly bears are known to migrate over large areas and will not stay in one location once the food supply is diminished. Washington state already has a problem with wolves. Another apex predator does not need to be added to the environment. There have been several people killed by grizzly bears this year. The people of Washington should not have to worry about this type of animal when we live in, work in, and enjoy the states great outdoor.s

Correspondence: I do not support the reintroduction of Grizzlies. There is too much unknown variables that could be detrimental to the already struggling ecosystem we have with the increase of apex predators in WA. If Grizzlies were introduced and started to increase in population and started to encroach on the places where ungulate populations, black bear populations, and cougar populations were in balance, what's the plan when the grizzlies impact them? What happens when they encroach human territories and kill livestock?

Ransom can be quoted saying "So, that might include, you know, getting bears and moving them back, if they stray outside of where we want them to be,". In what world is that fair to the bears? It's basically a glorified captivity. How is this humane? We set them up in an area and expect them not to go wherever they want? They're a wild, apex, animal, they do not solely eat roots and berries like people have said. What will happen to our fish populations?

I think our commission already has a hard time managing the populations we currently have, there is no trust from me they will adequately manage grizzly populations.

Correspondence: As a Washington resident and national park lover, I strongly support the National Park Services preferred Alternative C: Restoration with Endangered Species Act Section 10(j) Designation. This plan will both effectively restore grizzly bears in North Cascades National Park and give people the tools they need to thrive in and around grizzly bear country. Grizzlies belong in the North Cascades, as they enhance the park's ecological integrity and contribute to its wildness. My family and I love the national parks and we spend a lot of time in them - primarily up at Rainier as it's a bit closer to where we live in Redmond, but also quite frequently in the North Cascades.

A restored population of grizzlies will boost the park's appeal and attract nature enthusiasts, scientists, and tourists from around the world. This would provide economic benefits to local communities and support the park's mission to protect park resources in perpetuity.

Alternative C, with the 10(j) rule, addresses safety concerns while protecting the grizzly population. It ensures coexistence between humans and bears.

Please consider the positive ecological and economic benefits and support Alternative C. Restoring grizzly bears will preserve the park's natural heritage and conserve an iconic species for current and future generations.

Thank you for your dedication to our national parks.

Correspondence: Hello, I am writing to express my opposition to the reintroduction of Grizzly Bears into the North Cascades of Washington State. I have many family members and friends that live in that area and I would be concerned for their safety should this plan move forward. With many of their homes, there is no way to adequately secure and prevent Grizzly Bears from being able to come onto their property. It's not as simple as building a fence and in their cases building a fence or taking other measures would be impossible due to the topography and other physical characteristics of the land in which they live. Bringing Grizzly Bears into the area would put them, their livestock, pets, etc. in danger. They have a hard enough time protecting against the predators that are already present in these lands, adding a new one would make it even harder and more dangerous. I urge you to reconsider this plan and perhaps find a different area to use as habitat for the bears.

Correspondence: Comments on the North Cascades Ecosystem Grizzly Bear Restoration Plan EIS:

The document failed to analyze the true impact of grizzly bear introduction and ultimate grizzly bear populations on the human environment.

- Public safety and other impacts were often approximated based on data from other Grizzly Bear Recover Zones (GBRZs), but unlike the North Cascades Ecosystem (NCE) none of these are immediately adjacent a major population center like the Puget Sound Basin. Additionally, several heavily used highways access the very heart of the NCE namely, SR 20, US 2 and I90. The hundreds of overflow-vehicles lining SR 20 on weekends around trailheads is a testament to the intense recreational interest and use of these wild lands. Lines of hikers and their dogs use the popular trails along the crest of the Cascades. Estimates of use in this area are underestimated if only because not everyone signs the trail logs. The EIS seems to rely

heavily on Yellowstone Park statistics regarding bear/person interactions citing the park's large visitor use. However, the data doesn't reveal that the great majority of those visitors are primarily driving along the roads and hiking heavily used boardwalks to popular hot spring features. You can't compare experience at Yellowstone Park to the NCE, Yellowstone has been in the business of people & bear Management for over a hundred years. Also, unlike Yellowstone the NCE has no big herds of ungulates to prey upon.

- The EIS underestimates the likely impacts to access caused by the ultimate grizzly bear populations. Road closures are common in other GBRZs to protect the animals, especially during the spring season.
- Public education will not necessarily prevent bear/person interactions because prevention techniques are often ignored by recreationists (note innumerable photos posted to the web).

The EIS fails to fully analyze the potential for introducing invasive species into our most pristine wilderness and Park lands here in the Cascades. Bears and the traps will be transported from areas far away from the NCE, likely from areas know to have invasive weeds and animal/human diseases. What is the potential for spreading invasive species (plant & animal) and diseases (ie, tick-born or hoof/chronic wasting disease) on or in the traps or helicopters, or in the bear's feces or fur?

The document suggests that there is great value in returning the grizzly bear, a so-called apex predator, more quickly to the NCE than it would occur under the no-action alternative. This argument is not convincing. There exist no great herds of ungulates in NCE which are in desperate need of control. And, even so, healthy and widely distributed populations of other large predators are already present; black bears, cougars and wolves. The claim is made that some people will feel good just knowing the animal is roaming the country. There are those that get the same romantic feeling about free-roaming wild horse and burro herds ranging across the West. Unfortunately those populations are wreaking havoc on the range lands managed by the US Bureau of Land Management and US Forest Service. Despite real and ongoing resource impacts the agencies' attempts to manage that situation has utterly failed, stopped dead. (Perhaps there is where the grizzly bears should be shipped).

We fiercely support the No-Action alternative. If, as the EIS claims, the NCE is so attractive for grizzly bears, they will come on their own and there will be no guilt or blame. We have no confidence that the agencies will properly manage an "experimental population" of grizzly bears in the best interests of the people that are most likely to be affected, recreationists, ranchers, farmers and the local residents. Like Washington wolf "management" the effort and the cost will more likely be placed on the farmer or rancher to manage the bears. And any effective management action proposed by the agencies will no doubt be stymied by special interests welding the T&E Species Act.

Correspondence: I strongly support restoring grizzly bears to the North Cascades. Grizzly bears need and deserve our help. We humans eliminated them from this area, so we have a moral obligation to restore them to their rightful place in the North Cascades ecosystem. Grizzly bears will play a vital role in maintaining the health of the ecosystem. By taking reasonable precautions, people can and already do elsewhere safely co-exist with grizzly bears and hike, camp and fish in grizzly bear country. Alternative C "Restoration with Endangered Species Act Section 10(j) Designation" appears to me to be the most reasonable and likely to succeed alternative. This alternative allows authorities greater flexibility to manage conflict and balance recovery goals with human safety and tolerance of grizzly bears. Thank you and best wishes for successfully restoring grizzly bears to the North Cascades ecosystem.

Don Striker, Superintendent
North Cascades National Park Service Complex
810 State Route 20
Sedro Woolley, WA 98284

Submitted online and via USPS mail

Dear Superintendent Striker,

The Center for Biological Diversity ("the Center") is a nonprofit organization dedicated to the protection of native species and their habitats through science, policy, and environmental law. The Center has more than 89,000 active members, including members within the grizzly bear's current and historical range. The Center and its members have a long-standing interest in conserving native species in the American West and have routinely advocated for the conservation and protection of native species including grizzly bears in the North Cascades.

The Center has deep and longstanding interests in the restoration of grizzly bears in the North Cascades Ecosystem ("NCE"). To further these goals, the Center has participated in various agency proceedings, including previous and current proceedings under the National Environmental Policy Act ("NEPA") to augment the North Cascades grizzly bear population. In December 2020, the Center filed a lawsuit challenging the Trump administration's sudden termination of the previous process, which was nearly finalized before being cancelled. We were pleased that the National Park Service ("NPS") and U.S. Fish and Wildlife Service ("FWS") restarted the environmental analysis process in November 2022. We provided scoping comments in December 2022 and now submit comments on the Draft Environmental Impact Statement.

The 1993 Grizzly Bear Recovery Plan and the 1997 Grizzly Bear Recovery Plan Supplement providing the North Cascades Recovery Plan Chapter both acknowledge the need to restore and recovery grizzly bears in the North Cascades in order to recover the listed species in the lower 48 states. Moreover, as recently as 2022, FWS acknowledged that conservation efforts must increase to improve resiliency of bear in the North Cascades to in turn improve redundancy and representation of grizzly bears in the lower 48 states. For these reasons, we believe that the no action alternative contradicts the purposes of the Endangered Species Act and shall not be further considered.

In general, we are most supportive of Alternative B. In accordance with rule 50 C.F.R. § 17.40(b) under section 4(d) of the Endangered Species Act ("ESA"), Alternative B still permits the lethal removal of grizzly bears for self-defense; federal, state, or Tribal scientific or research activities; and removals of bears involved in conflicts as authorized by federal, state, or Tribal authorities. Grizzly bears across the lower 48 states have been managed under this rule to date and as a result have moved closer toward recovery goals in four out of the six recovery zones designated by FWS. Thus, we feel that managing grizzly bears in the NCE under this rule provides the best opportunity for successfully augmenting the population of grizzly bears to reach recovery goals.

However, recognizing that the agencies have identified Alternative C as the preferred alternative, and thus provide comments on both of these action alternatives.

I. The North Cascades Ecosystem is Prime Habitat for Grizzly Bear Recovery.

The 1993 Recovery Plan identified the North Cascades evaluation area as an area with "sufficient amounts of quality habitat to warrant grizzly bear recovery in the area." In the 1997 Supplement, FWS identified boundaries and recovery goals for the North Cascades Ecosystem. In it, FWS identified approximately 6.1 million acres, or 9,565 square miles, within north-central Washington as the North Cascades Grizzly Bear Recovery Zone. As identified, the recovery zone includes all of the North Cascades National Park, and most of the Mount Baker-Snoqualmie and Okanogan-Wenatchee National Forests. The area is ideal for grizzly bear recovery because it encompasses about 85% federal lands, including approximately 41% that is within wilderness or the North Cascades National Park.

The DEIS relies upon a recent carrying capacity model to suggest that “the most plausible carrying capacity for the US portion of the NCE is approximately 280 bears.” We encourage the agencies to give themselves the ability through adaptive management to change this figure should additional information become available. For example, whether the agencies determine the capacity is 280 bears or some other number in the future, we urge the agencies to consider this number as a minimum population in the NCE, not a population cap above which bears will be killed or parameters to keep bears alive will decrease.

The Lyons model, while the most current best available science analyzing carrying capacity in the NCE, has some limitations. Due to the lack of data on various issues--including, for example, the volume of traffic on roads in the NCE, grizzly home range data for the NCE, and the lack of quantifiable information on the relationship between survivorship and habitat quality--it is clear that there are many variables that should be assessed in the future before any final carrying capacity level is determined.

Due to the lack of data of numerous variables in the NCE, the authors in Lyons et al. (2018) had to make assumptions and adjustments to run its model. For example, the authors admit that they “addressed uncertainty by conducting sensitivity analyses of key variables of survival and home range estimates” and that they used a female-only (single-sex) model structure, in part, “to reduce the complexity of the model.” However, a single-sex scenario is not realistic, and thus this simplification may have skewed the accuracy of the results. Additionally, while the authors appropriately considered the import of how roads may impact carrying capacity, the authors assumed that all currently open roads will remain open into the future. But land managers have the option to close roads to benefit wildlife, especially when threatened and endangered species are at issue. Should roads currently open be closed and re-vegetated in the future, it follows that the carrying capacity for grizzly bears in the NCE is likely to increase. The authors also were not able to model road influences based on traffic volumes, because the data was not available for the entire ecosystem, but one would generally assume that traffic volumes in this relatively remote area is likely quite low.

Moreover, it is important to note that Lyon et al (2018) did not definitively conclude that the carrying capacity for grizzly bears in the NCE was 280 bears. Rather, the authors concluded a range of 108-379 females, or 215 to 758 total bears. 280 bears is just their estimate based on mid-range scenarios when manipulating multiple variables.

Thus, while we support the Lyons model as the best available science to date, we nevertheless feel that should more current science become available that supports a different carrying capacity, the agencies should take that new science into consideration and adaptively manage for whatever carrying capacity is best supported by the science.

In any event, if the agencies determine the capacity is 280 bears or some other number in the future, we urge the agencies to consider this number as a minimum necessary to create a sustainable population in the NCE, not a cap above which bears will be lethally removed from the population or parameters to keep bears alive will decrease.

We also encourage the agencies to protect connectivity corridors to support genetic exchange. Both alternatives allow for an adaptive management phase during which the agencies would consider the release of additional grizzlies if monitoring shows that releases are necessary to benefit, amongst other things, the genetic integrity of the population.

As seen on this map, the grizzly bear's historic range connected grizzly bears in the NCE to other grizzly bears in Idaho, including other identified recovery areas including the Selkirks, the Cabinet-Yaak, and the as of yet unpopulated Selway-Bitterroot area. We believe that it would be wise for the agencies to protect existing connectivity corridors to encourage genetic exchange between the NCE and other grizzly bear populations. Scientists have also championed the assessment and protection of potential linkage zones to alleviate potential population isolation of bears in the NCE.

Similarly, it may be important to work with officials in British Columbia to ensure that bears in the NCE that cross the Canadian boundary are adequately protected. Allowing for connectivity between the U.S. and Canada for these bears to roam is helpful and necessary to facilitate recovery and connectivity with other bears in the U.S. This is especially true whereas Canada is now considering a translocation effort to recover bears in the Canadian portion the NCE.

II. Alternatives B and C

A. The Current 4(d) Rule for Grizzly Bears is Sufficient to Manage of Bears in the NCE

We support Alternative B because as noted above, grizzly bears populations across the lower 48 states managed under the 50 C.F.R. § 17.40(b) under section 4(d) of the ESA have made successful steps towards recovery. This 4(d) rule maintains flexibility in that it still permits the lethal removal of grizzly bears for self-defense; federal, state, or Tribal scientific or research activities; and removals of bears involved in conflicts as authorized by federal, state, or Tribal authorities. Managing grizzly bears under this 4(d) rule is a proven strategy that may provide the best opportunity for successfully augmenting the population of grizzly bears in the NCE.

Moreover, although we do not necessarily disagree that it makes for FWS to designate grizzly bears as an experimental population under section 10(j) of the ESA, given FWS has concluded they are functionally extirpated from the U.S. portion of the NCE, such a designation does not need to be accompanied by a rule that increases opportunities to kill bears.

Because FWS treats a 10(j) population like a “threatened species, 16 U.S.C. § 1539(j)(2)(C), the ESA requires FWS to issue regulations “necessary and advisable to provide for the conservation of such species.” Id. § 1533(d); see also 50 C.F.R. § 17.82. The regulations may prohibit actions to conserve the species, including prohibiting all forms of take. 16 U.S.C. § 1539(d); id. § 1538(a)(1). We believe that the current 4(d) rule already allows for the lethal removal of bears involved in conflicts, without defining what conflicts should qualify for lethal removal. See 50 C.F.R. § 17.40(b). Thus, we do not believe the Service is under any obligation to issue a new rule to expand allowable take for grizzly bears in the NCE. With that in mind, we provide specific comments on the proposed 10(j) provisions below.

B. Geographic Extent of the Experimental Population

In our scoping comments, we noted that the boundary of a 10(j) designation needs to be carefully considered in the DEIS to prevent the possibility of grizzly bears in the Selkirk population being affected by the NCE 10(j) designation. The agencies must ensure the Selkirk population continues to receive full protection under the ESA. Thus, we suggested that the 1-10(j) boundary for the NCE extend to no more than 25 miles east of the North Cascades Recovery Zone.

The proposed geographic extent for the 10(j) designated population ensures that grizzly bears restored to the NCE would be separated from the nearest grizzly bear population in the lower 48 states - the Selkirk population - by at least 100 miles. Although long-term connectivity is the goal, we feel that given current connectivity obstacles this distance is sufficient to protect grizzly bears in the Selkirks as endangered, and thus we support the boundary designation.

The DEIS explains that the NCE boundary, however, is further divided amongst three management zones “based on suitability for occupancy by grizzly bears and the likelihood of human-bear conflicts.” The DEIS on page 37 contains a map of the management zones.

Management zone 1 includes the Mt. Baker-Snoqualmie National Forest and Okanogan-Wenatchee National Forest north of Interstate 90 and west of Washington State Route 97, as well as the park complex. Management zone 1 would be the primary area for the restoration of grizzly bears and would serve as core habitat for survival, reproduction, and dispersal.

Management zone 2 includes the Mt. Baker-Snoqualmie National Forest and Okanogan-Wenatchee National Forest south of Interstate 90, Gifford Pinchot National Forest, and Mt Rainier National Park. Management zone 2 also includes the Colville National Forest and Okanogan-Wenatchee National Forest lands east of Washington State Route 97 within the NEP boundary. Management zone 2 is meant to accommodate natural movement or dispersal by grizzly bears.

Management zone 3 comprises all other lands not contained within management zones 1 and 2 within the NEP boundary. Management zone 3 contains large areas that may be incompatible with grizzly bear presence due to high levels of private land ownership and associated development and/or potential for bears to become involved in conflicts and resultant bear mortality; although, some areas within this management zone can support grizzly bears, and grizzly bears may occur in portions of this zone. The intent of management zone 3 is to allow more management flexibility than the other zones to minimize impacts of grizzly bears on landowners and other members of the public.

Although the Center is not opposed to the division of the NEP area into management zones in theory, the Center has serious

concerns about how the agencies propose to treat grizzly bears in the three zones, as explained below.

D. Excessive Authorization to Take Reintroduced Grizzly Bears

“Protective regulations” issued for reintroduced species, treated as threatened species, must “provide for the conservation of such species.” 16 U.S.C. § 1533(d); see also 50 C.F.R. § 17.82. Thus, as an initial matter, we wish to stress that as proposed, healthy, non-conflict bears will be taken from the wild and their native ecosystems from other populations - - likely the NCDE grizzly bear population - - for this reintroduction effort. As such, every effort must be made by the FWS to ensure that these healthy, non-conflict bears will be protected to the greatest extent in regard to any allowable take under an ESA section 10(j) rule.

Similarly, relocation of grizzly bears within the NCE or that leave the NCE after reintroduction should be carefully considered by the agencies. Doing so may disincentivize communities to use proper conflict prevention measures. Moreover, in order to minimize injury or death due to stress and complications surrounding capture and relocation, we propose that FWS approve live capture with culvert traps rather than restrictive foot traps.

Unfortunately, the proposed regulations authorize lethal take of reintroduced grizzly bears under numerous circumstances but fail to provide any scientifically based factual support that such killing would further grizzly bear conservation.

According to the DEIS, the following take of grizzly bears would be allowed in all management zones in the NEP area (see DEIS at 38):

1) Self-defense or the defense of others based on a good-faith belief that the actions taken were to protect the person from bodily harm.

We understand the need to provide humans with means to protect themselves from bodily harm and we support allowing one to kill a grizzly bear in self-defense. This is also in line with the current 4(d) rule applicable to grizzly bears in the lower-48 states. We have seen this self-defense provision abused, however, to cover up what appears to be poaching where self-defense was not a real concern, so we encourage authorized agencies to be mindful of that when investigating claims of self-defense. We also encourage the agencies to require people to carry bear spray in Management zone 1 to minimize grizzly bears being killed in valid self-defense situations. Areas where grizzly bear presence overlaps with game hunting or black bear hunting often represent an especially high number of self-defense killings.

2) Deterrence for the purposes of avoiding human-bear conflicts or to discourage bears from using areas in the immediate vicinity of homes and other human-occupied areas. Any person who deters a grizzly bear must use discretion and act safely and responsibly in confronting grizzly bears involved in conflicts. The FWS provides guidelines for safe and responsible hazing of grizzly bears. See FWS Grizzly Bear Hazing Guidelines (FWS 2020).

We support the general idea of hazing bears to discourage conflicts in areas near homes and human-occupied areas. However, FWS must be specific about what is allowed and what is not allowed, in order to minimize the potential for unintentional lethal take during hazing. Simply referencing hazing guidelines and telling people to “use discretion” without explaining that they must follow the hazing guidelines and tactics proposed in the guidelines is insufficient to minimize lethal take.

3) Research and recovery actions by a federal, state, or Tribal agency designated by the FWS to assist in implementing the section 10(j) rule.

We support limited take of grizzly bears for research and recovery actions, as supported by the current 4(d) rule applicable to grizzly bears in the lower-48 states.

4) Removal of grizzly bears involved in conflict, up to and including lethal removal, by qualified employees or designees at an agency authorized by the FWS, but only if: (1) it is not reasonably possible to otherwise eliminate the threat by nonlethal deterrence or live capturing and releasing the grizzly bear unharmed in a remote area; (2) the taking is done in a humane manner by an authorized agency, and after approval from the FWS; and (3) the taking is reported to the FWS.

While we appreciate the sideboards here describing when removal of grizzly bears involved in conflict is permitted, there is no explanation as to when and why it might not be reasonably possible to otherwise eliminate the threat by nonlethal deterrence or live capturing and releasing the grizzly bear unharmed in a remote area. We propose that FWS provide some examples explaining why relocation might not be reasonably possible.

5) Unintentional take of a grizzly bear, provided such take is non-negligent and incidental to an otherwise lawful activity, the take is promptly reported to the FWS, and if the take occurs on national forest lands, that the USFS has maintained its “no net loss of core” approach and implemented food storage restrictions throughout management zone 1.

The Center does not support this provision. As written, it seems to codify incidental take of an unlimited number of bears in connection with an unlimited variety of scenarios, including take as a result of any forest management projects. In Management zone 1, which is considered “the primary area for the restoration of grizzly bears” that would “serve as core habitat for survival, reproduction, and dispersal,” giving the Forest Service or others a free pass when grizzly bears are incidentally killed is unacceptable.

Additional take of grizzly bears allowed in management zones 2 and 3 would include (see DEIS at 38-39):

1) Relocation of grizzly bears. With prior agreement from the FWS, qualified employees or designees from FWS-approved federal, state, or Tribal agencies may live-capture grizzly bears in management zones 2 or 3 and transport and release those grizzly bears in a remote location agreed to by FWS, WDFW, and the applicable land management agency for any of the following reasons:

- a) When necessary for the purposes of enhancing their conservation.
- b) After depredation of lawfully present livestock or unnatural use of food materials that have been reasonably secured from the bear, resulting in conditioning of the bear or significant loss of property.
- c) After aggressive (not defensive) behavior toward humans results in injury to a human or constitutes a demonstrable immediate or potential threat to human safety.

The Center generally does not disagree with grizzly bear relocation under these circumstances. However, because grizzly bears can sometimes be unintentionally killed during relocation, we urge FWS and other agencies to fully investigate the circumstances, for example, by confirming that unnatural food was reasonably secure and that livestock owners took steps reasonably necessary to minimize predation of livestock by grizzly bears. Grizzly bears do sometimes return to areas where they received easy food rewards or found vulnerable prey (such as livestock), so we propose that livestock owners must be able to document and demonstrate the use of non-lethal deterrents before grizzly bears are removed and relocated for livestock predation. Non-lethal deterrents appropriate for the area that should be implemented before relocation is considered should be included in all grazing permits. This would encourage livestock owners in Management Zone 2, which includes large swaths of National forest land and is “meant to accommodate natural movement or dispersal by grizzly bears,” to take responsibility for keeping their livestock, and in turn grizzly bears, safe.

2) Conditioned lethal take. With prior written authorization from the FWS or an authorized agency, livestock owners may lethally take a grizzly bear within 100 yards of legally present livestock if a depredation has been confirmed by the FWS or an authorized agency, and it is not reasonably possible to otherwise eliminate the threat by nonlethal deterrence or live capturing and releasing the grizzly bear unharmed in a remote area. If, after two weeks from the confirmed depredation, no further depredations have occurred, the permit would expire. Any grizzly bear killed under this provision must be reported within 24 hours to the FWS and the carcass surrendered to FWS.

The Center does not support this provision. Livestock conflicts are one of the greatest causes of human-caused mortality to grizzly bears in the conterminous United States, yet most of these conflicts are preventable. Moreover, numerous scientists have found that lethal predator control is ineffective at curbing livestock predations.

First, killing grizzly bears to protect livestock should not be permitted on public land. We propose that this provision only

apply to private land.

Second, livestock owners should be required to document and demonstrate the use of non-lethal deterrents before grizzly bears are removed and relocated for livestock predation. Should FWS maintain this provision and apply it to public land, non-lethal deterrents appropriate for the area that should be implemented before relocation is considered should be included in all grazing permits, and livestock owners should be required to use all non-lethal deterrents listed in the grazing permit before receiving a permit to kill a grizzly bear. Preventative methods to minimize livestock conflicts include electric fences, guard animals, and human presence.

On private land, livestock owners should be required to document and demonstrate that they have exhausted nonlethal deterrents that may be effective at minimizing or halting conflicts before receiving a permit to kill a grizzly bear.

Additional take of grizzly bears allowed in management zone 3 would include:

1) Preemptive relocation of any grizzly bear. With prior approval from FWS, federal, state, or Tribal authorities may live-capture any grizzly bear occurring in management zone 3 and relocate as a preemptive action to prevent a conflict that appears imminent or in attempt to break habituated behavior of bears lingering near human-occupied areas.

Due to the risk of injury or death to grizzly bears during relocation, the Center does not support preemptive relocation of grizzly bears where no conflict has occurred.

2) Conditioned lethal take. The FWS, or authorized agency may issue prior written authorization to any person to kill a grizzly bear in management zone 3 when necessary for public safety or to protect property, but only if:

- a) The FWS or authorized agency determines that a grizzly bear presents a demonstrable and ongoing threat to human safety or to lawfully present livestock, working dogs, domestic animals, crops, beehives, or other property; and it is not reasonably possible to otherwise eliminate the threat by live capturing and releasing the grizzly bear unharmed;
- b) Once the FWS or authorized agency determines the threat is no longer ongoing, the FWS or authorized agency would notify the person, terminating the authorization;
- c) The individuals requesting the written authorization are otherwise authorized by the landowner or land management entity;
- d) The taking is done in a humane manner; and
- e) The taking is reported to the FWS, and the carcass is surrendered to the FWS.

The Center cannot support this provision for several reasons. First, FWS or an authorizing agency has absolutely no way to ensure that a person with a permit to kill a grizzly bear will be able to kill it "in a humane manner." Second, what constitutes a "demonstrable and ongoing threat" if no conflict has actually occurred? This is too discretionary and could potentially cover any grizzly bear within hundreds of feet or yards of a human, livestock, working dogs, domestic animals, crops, beehives, or other property. It is hard to imagine there are many places within management zone 3 that are not within proximity to one of these elements. Third, as similarly stated above, we propose that FWS include language to ensure that authorization for a person to lethally remove a bear under this provision includes review as to why relocation might not be reasonably possible. At the very least, the person who perceives a threat should be required to use nonlethal deterrents before receiving any such permit. Contrary to statements made in the DEIS, there is no scientific support for the notion that killing bears increases social tolerance.

Finally, I wish to note that some of the language in the DEIS noted above does not track completely to the language in the proposed 10(j) rule printed in the Federal Register. The agencies must ensure that the final DEIS and any finalized 10(j) rule are fully consistent.

Thank you for taking these comments into consideration. The references cited below will be sent to you on a USB drive via mail. If you wish to discuss this matter, please contact me at [REDACTED] or email me at

Correspondence: After studying the 3 Alternatives proposed by the FWS and Park Service, I support Alternative C, the Preferred Alternative, utilizing the 10(j) rule of the ESA. The research shows clearly that the North Cascades ecosystem is some of the very best habitat for bears in the lower 48 states; almost every climate model shows that Grizzly habitat will increase with advancing climate change. In recent research, 100 out of 124 plant species that Grizzly bears eat exist in the North Cascades. So many of the arguments against Grizzly bear reintroduction simply don't stand up to scrutiny- the claims that there will be a lack of food, that we can't coexist with bears, that the bears will terrorize the population and that nobody will be safe. . . . in the year 2021, over 5 million people visited the Greater Yellowstone Ecosystem which supports a population of 1100 Grizzly bears. Since Yellowstone National Park was established in 1872, there have been 125 drownings in the park, 23 deaths by burns (falling into hot springs), and 8 deaths by run-ins with bears. This suggests strongly that we can and have coexisted with bears at Yellowstone, and that the sheer numbers of visitors each year contribute more to the encounters with bears than the bears themselves. In western Montana, the citizens of the Blackfoot River watershed have coexisted with Grizzly bears since the time of Lewis and Clark and before. They still coexist today in the Blackfoot. There are proven methods to enable coexistence with bears and these along with public education are an effective way to manage a bear population. Finally , the small numbers of bears to be reintroduced and the slow reproduction rates of Grizzly bears should enable the FWS and Park Service to manage the bears in a proactive, comprehensive, and adaptive way, making changes along the way as needed. With such a small population of bears in the first few years, this should be very manageable utilizing the flexibility of the 10(j) rule. Any conflicts with humans will almost certainly be very minimal in the beginning, giving the FWS and Park Service time to prove to the public that the reintroduction using 10(j) can be successful. I strongly support the Preferred Alternative, and the use of the 10(j) rule, in the re-introduction of the Grizzly bear to the North Cascades.

Correspondence: I am writing in support of the restoration of grizzly bears to the Cascade Range. Of course as a hiker and conservationist I feel strongly about ensuring the future of grizzly bears in general, but I am also very interested in the restoration of the natural food webs in our region. We need the apex predators that evolved here to remain here, and reintroducing grizzlies will help to restore and maintain the proper ecological balance. The science is clear that the reintroduction of grizzlies to their native habitat is not only important to the region, but also poses very little threat to humans as long as we continue to adopt safe policies regarding areas where humans and bears may interact. Please bring back these symbols of our cultural and regional heritage, and help to restore the natural balance in the Cascades.

Correspondence: I'm generally in favor of an introduction of a small stable population of grizzly bears, though the planned distribution timelines could benefit from a "pause and study" approach. I believe all could benefit from a slower introduction over a longer timeframe to analyze the ecosystem and human impacts of for example 10 bears in an area. A thorough study after 3-4 years could better inform the reality of bear introduction, so as to avoid problems wolf introductions have had unintended consequences in Washington and other western states.

Correspondence: I am a property owner in Okanogan County, within the North Cascades Ecosystem and near proposed grizzly bear reintroduction sites. I also have more than 35 years professional experience as a natural and social scientist in the Pacific Northwest. I use the affected area for hiking, backpacking, horseback riding, snow travel, fishing, wildlife viewing, sightseeing, overnight camping, and other recreational activities. I also maintain a residence and keep livestock on my property seasonally. I have obvious potential to be directly affected and harmed by the reintroduction of grizzly bears in the North Cascades Ecosystem.

I have reviewed the Draft Grizzly Bear Restoration Plan Environmental Impact Statement North Cascades Ecosystem, dated Sept 2023. I would like for my comments here to be entered in the official record. I am concerned by a number of the EIS's assessments and conclusions related to human, socioeconomic, and Wilderness impacts. I am absolutely in opposition to both Action Alternatives "B" and "C". The adverse impacts and risks of the action alternatives as acknowledged in the EIS are excessive relative to the benefits, and many of the adverse impacts are unavoidable. No Action is the only prudent and reasonable alternative based on the EIS.

The EIS is especially flawed at its foundation because it fails to develop and explain with adequate and convincing rigor the "need" for the proposed action. The need must be clearly supported for the public and other agencies to understand and consider a range of reasonable alternatives. The current purpose and need is clearly circular and self-serving as it claims that the need is to "Restore grizzly bears to the NCE" and the purpose is the same - to "restore the grizzly bear to the NCE". No adequate explanation or support for this need is developed or presented.

The adoption of the purpose and need statement is one of the most consequential decisions that a lead agency makes in the National Environmental Policy Act process, because the purpose and need provides the foundation for determining which alternatives will be considered and for selecting the preferred alternative. See: *Citizens against Burlington, Inc. v. Busey*, 938 F.2d 190, 196 (D.C. Cir. 1990) "an agency may not define the objectives of its action in terms so unreasonably narrow that only one alternative from among the environmentally benign ones in the agency's power would accomplish the goals of the agency's action, and the EIS would become a foreordained formality."

The CEQ regulations require an EIS to "rigorously explore and objectively evaluate all reasonable alternatives" and to "[d]evote substantial treatment to each alternative considered in detail so that reviewers may evaluate their comparative merits." See: 40 CFR 1502.14(b). The narrow and unsupported statement of purpose and need make suspect whether the lead agency adequately developed other potential reasonable alternatives.

In addition, the Draft Minimum Requirements Decision Guide Workbook decisions are flawed. No motorized vehicles or tools should be allowed within the Wilderness during the reintroduction consistent with the Wilderness Acts' intent to maintain and protect the Wilderness natural character and untrammelled quality. There are viable means of reintroduction acknowledged by the lead agency that must be attempted prior to violating the Wilderness and its solitude. The suggestion that the Wilderness is currently not "natural" is self-serving and not defensible.

Correspondence: The draft EIS fails to comply with Code of Federal Regulations Title 40 Chapter V Subchapter A, Part 1502.2(b) insofar as it's noncompliance to proportionately document the risks to public safety. While the classification of the Grizzly is easily identified by laypersons as having dangerous and unpredictable behavior and is well known as the top-of-the-food-chain apex predator, nevertheless the draft EIS fails to discuss the consequences to humans of such dangerous and unpredictable behavior. Moreover, the draft EIS fails to discuss in proportion the well documented significant risks to the public as required by 40 CFR 1502.2(b). While Grizzly attacks have been frequent news headlines for communities located near existing Grizzly recovery zones, this same information is not easily available by heretofore unaffected communities. This is why the draft EIS is required to inform the communities that are in the crosshairs of these actions proposed by the

Lead Agencies, however this has not been done. The safety of the public deserves to be a principal consideration during the draft EIS process when proposing to put apex predators onto public lands. Clearly this is not the case. Instead, impacts to public safety are disproportionately represented, in fact are silent in the draft EIS through omission of relevant information concerning Grizzly attacks on humans. The fact is the draft EIS fails to include the well documented grizzly-to-human conflicts resulting from frequent Grizzly attacks occurring inside and outside existing recovery zones. Existing research shows the majority of human-grizzly bear conflicts occur outside recovery zones, according to the draft EIS Page 60 which states, "Approximately 90% of the recovery zone is in federal, Tribal, or state ownership, with only 10% on private lands (Dood, Atkinson, and Boccadori 2006). However, the majority of human-grizzly bear conflicts and bear mortality occur on private lands, especially as grizzly bears expand their ranges." In other words, while the draft EIS admits to the predominant destination of Grizzlies to private lands, by omission it conceals from the public the tragic consequences of Grizzly attacks on humans, including the frequency of such attacks, proximity to population centers, as well as severity of resulting injuries and deaths. As an example, at the end of my comments is a partial list of recent human deaths and injuries resulting from Grizzly attacks inside a brief 4-month period, and is a partial list because the season for Grizzly activity extends into late November.

(2) Failure to Comply:

Pursuant to Title 40 Chapter V Subchapter A, Part 1502.2(f) which states, "Agencies shall not commit resources prejudicing selection of alternatives before making a final decision."

Correspondence: It is my understanding the our State does not require that we reintroduce endangered or species that have disappeared from our State. The Grizzly Bear does not qualify as an endangered species under the Endangered Species Act. Removing bears from other regions of the USA or CANADA is very expensive and has no value to the bears being captured or to the habitat they would be released into.
Bears have legs to releasing into a very remote area of a National Park or Wilderness area does not assure that they will stay

put.

If the decision were to be made to remove bears from their current homes. You should seek out bears that have had not contact with people. "dart"; them and transport by helicopter to an area with a road so they could be hauled away.

Leave the bears along and let them repopulate new habitats naturally if that habitat attracts and supports them.

Correspondence: As a fairly new resident to Bellingham and former wildlife rescue volunteer (sea lions, elephant seals, otters, etc.) who believes animals have every right to thrive in their native habitats, this is not an issue I take lightly and I am only offering input after much contemplation, and despite ultimately feeling torn on the matter.

I've spent the past two years in Whatcom County, and spent this past summer exploring the absolutely breathtaking trails that the North Cascades and Mt. Baker have to offer. While my plans for next season include a lot more exploring and a few backpacking and overnight trips, the idea of grizzlies in these forests would give me pause to say the least.

I've previously worked in government and took calls from members of the public reporting white shark sightings at the harbor where I worked in California. There had been a fatal attack in the harbor several years before I worked there, when a woman was diving with sea lions and was attacked by a white shark, and several other fatal attacks in local waters in that county and neighboring counties in previous and subsequent years. White sharks are obviously an invaluable part of the ecosystem and I wouldn't hesitate to support any measures set forth to protect their species' survival (despite having regularly tended to their pinniped victims). That said, absolutely no human was forced to enter an ocean teeming with white sharks. This proposal however; is obviously a bit different in that land is also human habitat (where water is not), and many residents may not have a choice in being exposed to a deadly predator.

I'm sure we've all read reports about families (including children) being mauled to death by grizzlies in Alaska after the animals entered their homes and property. While it may be rare, it's enough to keep me from booking a camping trip to Alaska anytime soon. I worry that the voices of residents who may be negatively impacted by local grizzlies have been glossed over and misidentified as supportive of this proposal. While I'm sure many of them are supportive (perhaps even a

majority), the idea of even one rural resident being mauled by a grizzly is enough to counteract my excitement about reintroducing a native species to the area. Which isn't to say I'm not supportive at all, but I do think the idea is a bit rushed (or at least seems to be presented that way), and that perhaps it should be attempted on a very small scale to start, with tracking collars and scientists monitoring behavior in a small group of animals for quite some time to rule out dangerous behavior before re-establishing populations all in one go (I don't know the current plan, so these are just my thoughts).

Additionally, in areas to the north where grizzlies reside, will data be collected and presented to the public regarding the number of attacks on residents, animals and hikers, etc., along with documented negative impacts on the community if there have been any? On the other side of that, supportive data showing the beneficial impacts of reintroduction in real numbers, with scientific data, would be helpful in supporting the claim that this will be of benefit to the environment. While I suspect it will be beneficial as stated, it would be helpful to look at data before taking a side, and it should be the responsibility of those proposing this endeavor (hopefully biologists and appropriate personnel) to present the information to the public instead of expecting us to do the research ourselves. Perhaps this information has already been made available and I overlooked it, in which case I apologize.

I was stunned by the number of eager hikers at Artist Point and other trailheads throughout this past summer. I met so very many (amazing!) dogs on the trails. As the pet parent of a small, senior fur baby, I know that even my little guy would charge a grizzly if it meant protecting me, and I worry that each and every dog on these trails would react in the very same way. I will confess I don't know much about grizzly behavior, but I imagine dogs may be seen as a meal or territorial threat which could lead to some very awful consequences for both canines and their humans. I know mountain lions and other bear species present an occasional risk, but none seem as truly terrifying as a grizzly. Big cats do show mercy by killing their prey before consuming it, grizzly bears do not offer that same courtesy. I also wonder if the fire activity we've consistently seen in recent years would bring these animals closer to smaller towns in search of food as they attempt to escape flames along with the animals they usually consume.

My last point is a matter of comparison. Yosemite National Park used to be full of grizzly bears, as did much of California and the Pacific Northwest. I can't imagine Yosemite reintroducing grizzlies, as it would create a potentially unsafe experience for the several million visitors to the park each year. While North Cascades National Park certainly sees far less human recreation activity, I do think it's important to consider both the economic impact of the affect on tourism, as well as the potential for loss of life and limb for recreational visitors (and please don't forget about the brave PCT thru-hikers and the final leg of that journey which will take one through the area in question). I would certainly struggle if I made the call to bring dangerous animals to an otherwise relatively safe environment and someone suffered greatly, or a life (or many) were lost due to that decision. On the other hand, human activity has utterly ravaged animal populations in recent history in the most shameful of ways, and trying to achieve a more balanced habitat that humans can safely adjust to over time is obviously ideal.

In summation, I support a modified approach to the idea of the reintroduction of grizzlies to North Cascades National Park, with a small number of consistently monitored animals released and with data regarding those monitored animals to be provided to the public for review before further measures are taken; with education campaigns that provide hikers and campers with adequate information about safety, risks and known bear location. Providing a website with tracking of grizzlies in real-time for the general public to follow could be fun and cut risks to human safety (though I understand it could also unfortunately present a problem with poachers and irresponsible people hoping to catch a glimpse - or worse, a selfie).

Thank you for receiving my comment.

Correspondence: To The NPS, FWS, and decision-makers on the question of reintroducing grizzly bears to the North Cascades,

An important reason that I and my family have chosen to live in Okanogan County is for the strikingly beautiful, resilient, diverse ecosystems that are found here. Grizzly bears are (historically) a part of these ecosystems, and their extirpation is a result of colonization that can and should be remedied. As wolf populations have recovered in the West, most notably perhaps in Yellowstone, ecosystems are healing in unexpected ways and to unexpected extents. While wolves and grizzlies are quite different, both are apex predators and grizzlies too have an impact on and a role in their place, where their role and ecosystem services cannot be filled by other species.

I believe that concerns about potential dangers to people and livestock, while understandable, originate from fear of the unknown. Education and outreach to communities and people of all ages will go a long way in both reducing the actual potential for conflict with grizzlies (and all wildlife) and in reducing people's worry about potential conflict. Those who go into the backcountry, as we do as a family to hike, are already prepared for encounters with wildlife. Adding grizzly bears to the list of potential encounters does not add any extra complication or concern.

I write in support of Alternative C, with the 10(j) designation in order to launch this grizzly reintroduction effort with as many management tools as possible. I believe this will provide the greatest level of flexibility, appease the most people, and still allow grizzlies to be reintroduced to the North Cascades, allowing this important step toward restoring and healing ecosystems in the North Cascades to move forward.

Thank you.

Correspondence: Good evening,

I do not think bringing grizzlies back to the north cascades is a good idea. With all of the fire devastation the North Cascades have seen over the last decade I don't believe the animals that would need to be their prey for them to survive, are plentiful enough to keep a balanced ecosystem. Along with people trying to enjoy the deep back country. With an under fed and possibly malnourished grizzly bear to be concerned about. Thank you for the opportunity to share our thoughts. Hope to enjoy many more years in the back country.

Thanks,

██████████

Correspondence: As an avid backpacker and outdoor recreationalist, I am absolutely opposed to having these predators reintroduced to the North Cascades. I fail to see how they are a benefit to our ecosystem- no experts I've asked can answer that except by saying "well, they used to be here". I have no interest in carrying bear spray and possibly a weapon when I just want to enjoy the backcountry without that threat. It seems to me the biologists just need a project and want to

meddle in the way of "how things used to be"- when we didn't have the population we do now. We have way too many people in our backcountry now for this type of threat/predator. Leave things as they are- no grizzly bear reintroductions.

Correspondence: I support Alternative C: Restoration with Section 10(j) Designation. Alternative C is the best choice for bears and the people who live in and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Correspondence: This seems like a terrible idea, and I am surprised it is even being considered. British Columbia already has plans to introduce additional Grizzly Bears to their lower Cascades--it is just a matter of time before they cross the border, and if Washington has to ecosystem to support them, they will naturally populate the area. For Washington to introduce even more before we find out the consequences of potential bear from Canada seems hasty and reckless. Ecosystems are delicate things, and introducing too many large predators at once could wreak havoc on other species. In addition, our Cascades are used heavily by hikers and for recreation--Grizzlies are more aggressive than the black bear we are used to seeing out there, and tragic interactions between Grizzlies and people seems almost inevitable.

Correspondence: I am an avid outdoors person and hiker. I oppose the re-introduction of grizzly bears into the northern cascades at this time. There are many areas of our Washington ecosystems that should, in my view, be receiving funding priority and attention before the consideration of the reintroduction of grizzly bears. Examples of these include vital and necessary stewardship for the existing and threatened southern resident orca whale population, and the preservation of tracts of old growth legacy timber. Let's focus on preserving the literally irreplaceable aspects of what make Washington wilderness so worth living near, and show that we can be responsible and effective there, before we tackle non-essential projects. Thank you.

Correspondence: I strongly support the reintroduction of grizzly bears into North Cascade National Park.

An analogy is the reintroduction of wolves into Yellowstone. Famously, this has been an environmental success story. Grizzly bears are in many ways similar: they are also a top predator, feared by many humans, and pushed out of their habitat. The species is endangered, and could benefit from additional habitat. Also, they could have beneficial impacts on other species, restoring natural predator-prey relationships.

Black bears are well known within North Cascades, so visitors should be taking bear precautions already. I expect the impact on visitors to be minimal.

Correspondence: I support the recovery of grizzly bears in the North Cascades Ecosystem as described as Alternative C: Restoration with 10j Designation. Because grizzly bears were extirpated from the North Cascades Ecosystem by humans

through a variety of lethal means, the population of these magnificent creatures must be recovered through the planned, deliberate approach described in Alternative C. Additionally, designation of the future grizzly population as a non-essential experimental population through the 10J rule will allow for more flexible management in areas where conflict could occur between landowners and bears.

I have a question about the lack of an updated MOU with the USFS regarding the "no-net-loss-of-core" approach on USFS lands in Management Zone 1. If the MOU is not updated with USFS, what will happen to the 10J rule? Will it be rescinded? Will it be changed? Will the preferred alternative then become Alternative B: Restoration with Existing Endangered Species Act Protections?

In regard to the conditioned lethal take of grizzly bears allowed under Management Zones 2 and 3, I have concerns. Ranchers or property owners may not own a rifle of sufficient power to kill a grizzly bear. Also, a rancher or landowner may only injure a bear when they try to kill it and that would create a new problem with an injured, possibly agitated bear in the area. Consider changing the authorization of a lethal take to be completed by a qualified agency representative rather than a rancher or landowner.

Correspondence: My comment to draft EIS of the proposed plan to restore Grizzly Bears to North Cascades Ecosystem Alternative A (no-action alternative) is the only one I can support for these reasons:

- 1) Alternatives B and C will both have negative impacts to Okanogan County's agriculture and tourism industries.
- 2) The habitat of the NCE does not contain sufficient food sources to support a viable grizzly population. There would already be a population of grizzly bears if there was the needed habitat. It has been over 100 years since they have been hunted. There have been many sightings of grizzly bears in the region during this time, but they did not stay.
- 3) The grizzly bears will go elsewhere seeking food. Some you should expect will be eating endangered or threatened species including salmon. They will also go to fruit orchards doing damage to bee hives, threaten laborers, and damage fruit trees.
- 4) This paragraph from your document acknowledges the safety hazard of bringing in grizzly bears: "Negative interactions between humans and grizzly bears, while rare, do occur. Every situation is dynamic, and a grizzly bear's reaction depends on a variety of factors, including the proximity between a bear and a human, the type of encounter (i.e., whether the bear is behaving in a defensive or offensive manner), and whether cubs or a valuable food resource are involved, among other considerations. The restoration of grizzly bears in the NCE has raised concerns about safety risks to backcountry recreational visitors and residents of the NCE because of the potential for negative human-grizzly bear interactions. In addition, the capture, release, and monitoring of grizzly bears could affect employee safety given the dangerous nature of the activity."
- 5) This whole process conflicts with Washington State Law RCW 77.12.035. It appears questionable if this process is even constitutional. In proposing to violate Washington State Law this neglects the 10th Amendment's reservation principal of the United States Constitution, which states: "The powers not delegated to the United States by the Constitution, not prohibited by it to the States, are reserved to the States respectively, or to the people."

Sincerely,

Correspondence: I believe that reintroducing grizzly bear in the cascade is a terrible idea. We have a beautiful state with tons of trails and recreational sites across the cascade where we have lots of people that take the the mountains to enjoy it all.

We do not need grizzly bear to balance the eco system. We already have a terrible problem with predators from cougar and black bear. Maybe we should take care of other problems then just add another. I love to head to the hills and I do not want to look over my back in fear of being attacked by a grizzly. It has already been proven that they are a problem when looking a Montana and all the attacks that have been continuing been happening. As a life long resident of Washington I strongly oppose the reintroduction of grizzly bear here in Washington.

Correspondence: My initial question is WHY? Why would you introduce into our forests a creature that has been known to attack humans. Grizzly bears are not afraid of people as black bears are. Whereas black bears will generally leave the area if confronted unless they are caring for cubs, grizzly bears will attack humans even when not in a cub-protection mood. Even if bear spray has proven effective in deterring grizzly bears, do you really want to be that close to a grizzly to see if the spray will do the job?

For anyone who is just dying to see a grizzly bear, please just visit a zoo! We don't need them in the North Cascades.

[Please release the results of the comments. I am curious to see how many people want to visit or camp in a forest with grizzly bears.]

Correspondence: I moved to Washington State 22 years ago from Hawaii. I came for the mountains and have stayed for the mountains and other diverse landscapes. I am a devoted hiker and enjoy hiking in the Cascade foothills during the shoulder season and hiking in the Cascades during the summer and fall. Hiking is my therapy and my life. I live in Wenatchee so I hike often around Snoqualamie Pass and Stevens Pass, up the Teanaway Valley, in the Mount Rainier area, and in the North Cascades. I often hike 3-5 per week. I sometimes hike alone on popular trails. I backpack and camp at least once a year in the mountains. I forage for berries and mushrooms during the spring and fall. Depending on the remoteness of the hike, I carry bear spray. I feel comfortable hiking in black bear country and have had some encounters with them. I respect them but I don't fear them. I am very fearful of grizzly bears. I have hiked in Denali, Yellowstone, and Glacier National Park. I can honestly say that I did not enjoy my hikes in grizzly bear country because of the constant fear. Bear spray doesn't always work. The recent deaths in Banff National Park are an example of prepared hikers dying despite carrying bear spray and behaving properly in grizzly country. I don't think I will ever feel comfortable hiking in grizzly country.

Our ecosystem has alpha predators: wolves, black bears, and humans. Hunting is very popular in Central WA and they help curb the deer population. I do not see the necessity of adding another alpha predator to the Cascades. I understand their historical importance, but I don't think they need to be reintroduced. California isn't reintroducing grizzly bears to Yosemite National Park.

I work in a hospital and have seen patients come in after black bear attacks. I do not want to see a patient that was attacked by a grizzly bear. Washington is a very "outdoorsy" state. People love to hike. During Covid and after Covid, the trails became too crowded. I don't even hike on the weekends because of the crowds. The human population density is high and grizzly encounters are bound to happen. Please consider people safety first and foremost.

I DO NOT want grizzlies introduced to the North Cascade. I am in full support of "Alternative A" where there is no action to introduce grizzlies. I strongly disagree with the thought that restoration of grizzly bears to the NCE would increase visitation and recreational use because visitors would seek to experience grizzly bears. That is a delusional thought. People will be afraid. Every hiker I have talked to in Central Washington thinks that reintroducing grizzlies is a bad idea. A dangerous idea. I know I will not be hiking. I would consider moving away to another state that has great and safe hiking.

Correspondence: As members of Back Country Horsemen of Washington (Peninsula Chapter) we are very concerned about the future of recreation in the North Cascades Ecosystem if grizzly bears are translocated to areas used by large numbers of humans. The Pacific Coast Trail carries thousands of hikers and horseback riders every season. The Action Alternatives contain no substantive analysis of the impacts to recreation that will result from introducing grizzlies to this area. There are also many horse camps and heavily used trails just outside the NCE that would conceivably also be impacted. Safety for the recreating public and avoidance of trail closures are the worries that plague us. Therefore, we ask that the No Action Alternative be selected at this time.

Correspondence: This plan does not consider the increased population of the western side of washington state and increased usage of the North Cascades. For over 20 years this land was listed as Grizzly Habitat land with no Grizzlies making it a natural home. This seems to add to the forced addition of Grizzlies to this area which do not belong here. Adding Grizzly bears to an increased human population does not make sense. Yellowstone Park and Montana can show a history of negative interactions between grizzlies and people.

Correspondence: I support the reintroduction of Grizzly bears into the North Cascades. This area was formerly their territory and humans need to do their part in ensuring species survival. With the remoteness of the Cascade range, the bears will be seldom seen and will have minimal human interaction. Its important for hikers to stay vigilant and carry spray in case of an encounter as every walk in the wilderness is a risk that one takes. Regarding the delisting of the bears, their Endangered status should not be changed unless the population is thriving to prevent hunters from taking advantage of the situation.

Correspondence: Restoring the grizzly population to the North Cascade ecosystem is vitally important. It is our responsibility, as the cause of their absence, to restore this ecosystem. Grizzly bears are a keystone species and play a major role in the overall health of an ecosystem they belong or belonged to. Even a small population of them being reintroduced to the region would have a huge impact in as few as 2-5 years. This would make strides in returning the North Cascade ecosystem to its former healthier state. This area already hosts other large predators so there would be little adjustment needed from locals living and working in the area. Educating the human population on bear and wildlife safety is already necessary and should continue to be with the reintroduction of a species. We only have things to lose from not pushing forward with this plan but could make a huge change for the better if we move forward.

Dear US National Park Service :

I am a lover of nature, in all its forms. One of the most wonderous of those forms is the magnificent Grizzly Bear. Thanks to the Endangered Species Act and US Fish and Wildlife Service, and your agency, we may be able to reintroduce the grizzly bears into the North Cascades National Park system.

I am so happy about that eventuality, if it is allowed to take place.

I have lived in the state for 67 years, and have roamed our parks many times. Especially cherished were the times in our National Parks. Bears have been present, but humans have been made aware of the dangers, and the care to be taken to avoid encounters. I understand that grizzly bears in Montana and other areas have done well overall within the parks.

Please, please let our fellow mammals, the beautiful grizzlies, (back) into the territories they once traveled.

Thank you for this opportunity to offer my opinion.

Correspondence: I fully support the introduction of Grizzly Bears into the North Cascades range. It is beyond time to bring them back into the habitat.

I support a modified version of alternative C in the document ("Alternative C: Restoration with Endangered Species Act Section 10(j) Designation (Preferred Alternative)").

I do believe that 10(j) designation provides greater allowance for monitoring and managing the new population(s). I would like to see it modified so that "incidental taking" is highly restricted (if not totally).

Correspondence Type: Web Form
Correspondence: I am writing to express my concerns and reservations about the proposed grizzly bear restoration in our region, particularly from the perspective of a hunter who has spent my entire life enjoying the outdoors. From bird hunting in eastern Washington to turkey in Okanogan, elk in the Colockum, black bear and deer during the high hunt in the Methow. A variable like the grizzly bear is something I am absolutely against.

While I understand the importance of wildlife conservation and the desire to implore natural ecosystems, I believe that introducing grizzly bears could have significant negative impacts on both the hunting experience and the safety of outdoorsmen. The ramifications will fall on the Washington hunters and recreationalists. People voting in favor of grizzly introduction do not understand nor have they lived with such predator's before.

Safety Concerns:

Grizzly bears are known for their size and potentially aggressive behavior, especially when they feel threatened. This raises concerns about the safety of hunters who venture into the backcountry. Increased encounters with grizzly bears could pose

serious risks to human safety, leading to potential conflicts and accidents. Just this year, a deer hunting, scouting for a deer was mauled by a Grizzly Bear outside of Big Sky, Montana. Between 2022 and 2022 there were 8 fatal bear attacks. Yellowstone itself has one bear attack per year.

Impact on Game Populations:

Grizzly bears are omnivores, and their diet includes a variety of vegetation, insects, and, at times, large mammals. The presence of grizzlies in hunting areas will affect game populations, disrupting natural prey-predator dynamics and potentially reducing the availability of game species that hunters pursue.

Hunting Tradition:

Hunting has a deep-rooted tradition in our community, contributing not only to local economies but also to the cultural fabric of our region. The introduction of grizzly bears will alter the dynamics of hunting and outdoor activities, discouraging hunters and impacting the broader outdoor recreation community. The Pittman- Robertson Act provides funding for wildlife habitat, so I consider all hunters natural conservationists. A decline in hunters will threaten how the US decides on how to pay for conservation.

Livestock and Agriculture Impact:

Beyond hunting, the presence of grizzly bears could lead to increased conflicts with livestock and agricultural operations. This could create challenges for local farmers and ranchers who rely on these lands for their livelihoods. Eastern Washington and rural Cascade Range Washington is almost entirely dependent on agriculture.

Resource Allocation:

The financial and logistical costs associated with grizzly bear restoration are substantial. I strongly believe that these resources could be better utilized for other conservation efforts or addressing pressing issues within our communities.

Washington state previously passed a law banning the introduction of grizzly bears. This is the federal governments attempt to go around the wishes of the state of Washington. This is being done on a technicality. Please listen to those who will live out the consequences of these decisions.

In conclusion, while I appreciate the goals of wildlife conservation, I urge careful consideration of the potential consequences of introducing grizzly bears. It is crucial to strike a balance that ensures the safety of outdoor enthusiasts, maintains the hunting tradition, and supports the well-being of our local communities.

Thank you for your attention to this matter.

Correspondence: I firmly oppose the introduction of Grizzly bears to the north cascades. I've yet to hear anyone present a compelling reason how this will benefit the ecosystem in WA. It only adds risk to people recreating in the mountains, especially those out solo.

The facts are indisputable, grizzly bears kill humans. It happens regularly in AK, MT, and WY. Why should we add WA to this list?

This is a terrible idea and I'm shocked it's even being considered by the NPS.

Correspondence: The following updates are needed to the assessment to better guide decisions.

I support option A for the following gaps and failures of coverage of the current analysis:

1. Vegetation maps used to assess quantity of vegetation are of 30 years old and the landscape has changed significantly since then as clear cuts have filled in and many meadows have also grown in. A recent comprehensive analysis is needed. This vegetation study should include the abundance and not just the presence of these species listed. Many of those species are present but not abundant as they are in other ecosystems. The placement of the Skagit River Dams have further destroyed prime riparian lowland habitat that would sustain grizzly bears.

2. Identify the traditional diet of grizzly bears in the North Cascades. This is not covered in the EIS. WSU Bear lab has data and has tested bones where in the Puget Sound areas grizzly bears are 30-90% dependent on salmon for growth. What is covered in this EIS is the Isotope and diet analysis of potential introduced grizzly bear populations. I find it a failure that the prospective introduced population analysis is included but not the historical population's diet.

For references:

http://faculty.washington.edu/stn/ess_501/reading/Hilderbrand_Bear_stable_isotopes_Can_Zoo_1996.pdf "Information on the historical importance of salmon in the diet of grizzly bears would benefit the drafting and implementation of grizzly bear recovery plans"

"Historical use of salmon by Pacific Northwest grizzly bears While the recovery of historic spawning areas would benefit grizzly bear populations reintroduced to regions with reduced salmon runs, salmon are not essential for bear survival (Davis et al. 1986). In other ecosystems lacking salmon as a food resource, grizzly bears feed on vegetation, insects, ungulates, freshwater fish, and small mammals (Hamer et al. 1991 ; Mattson et al. 1991 ; Clevenger et al. 1992). However, studies have identified a strong positive correlation between the autumn mass of female bears and their reproductive success during hibernation (Rogers 1976; Stringham 1990). Bears' reproduction rate, one of the slowest of any terrestrial mammal (Bunnell and Tait 1981), is a critical factor in longterm population viability. Because spawning salmon are more nutrient dense than virtually any other food resource available to bears in the Pacific Northwest, grizzly bear recovery would be enhanced by simultaneous salmon recovery in the North Cascades and Bitterroot Ecosystem."

Currently, salmon populations are less than 10% of historical.

Furthermore, if grizzlies are introduced from non-salmon areas, yet there are salmon present, it increases the likelihood of failure due to Salmon Poisoning Disease. It is stated in the EIS about the Skagit and the number of salmon present attracting birds.

" Current recovery plans for grizzly bears in the North Cascades of Washington and the mountains of central Idaho, where infected salmon currently occur, call for using bears from several interior populations. We hypothesized that such bears with no history of salmon consumption will be sensitive to SPD."

<https://www.jstor.org/stable/26610350#:~:text=Although the current report is,the east side of the>

It would be better to introduce grizzlies from a salmon dependent species. .

3. In introducing grizzly bears not dependent on salmonids, we are creating our own idea of the "wild" and not trying to create the basis for the ecosystem that once existed that was able to support Grizzly Bears.

4. I find it concerning that the EIS includes fails to incorporate analysis of [ublished articles from the WSU Bear Lab that specifically researches large carnivores around North Cascades Grizzly Bears and how that may impact introduction.

5. There is no funding for the USFS to manage this, their staff has been cut over the last 30 years. The largest land manager

in the recovery area is the USFS. The USFS staffing has been decimated. No campgrounds on USFS lands on the west slope of the Cascades have bear boxes, bear hangs or bear infrastructure. There should be funding to go directly to the communities and agencies to adapt the infrastructure for this endeavor.

Correspondence: I am in favor of restoring endangered and threatened species, but I am not in favor of restoring Grizzly Bears to the North Cascades.

Grizzly Bears can be vicious animals. Human encounters, if they go bad, can result in severe injury or death.

The Draft EIS underestimates the severity and frequency of human encounters with Grizzly Bears.

There are several stories of Grizzly Bear attacks and human death in the Banff, Canada area. The plan overestimates the increase in visitation and recreational use due to seeking Grizzly bears. There will likely be a decline in visitation due to safety concerns over encounters with Grizzly bears.

I have encountered several Black bears in the Lake Wenatchee area and the North Cascades while hiking. My concern over these encounters was minimal because Black bears do not tend to attack humans and I made sure to not provoke the bears. However, an encounter with a Grizzly might result in an unprovoked attack or chase if I accidentally entered a Grizzly bear's territory.

My neighbor at Lake Wenatchee was attacked by a Black Bear and sustained severe injury. If that bear was a Grizzly bear, my neighbor would likely be dead.

I request that Alternative A be adopted, which is the no action plan.

If the NPS goes ahead with placing Grizzly Bears in the North Cascades, I request that serious efforts to track Grizzlies, as outlined in the plan, are made. Furthermore, there should be a real-time website that informs the public of where the bears are located so that the public can be prepared if they encounter a Grizzly, or to avoid an area where Grizzly bears are. I would hope that efforts would be made to prevent Grizzly bears from entering residential areas.

Thank you.

Correspondence: I prefer Alternative A, no further action. Allow Grizzly Bears to repopulate the North Cascades Ecosystem on their own. I would also prefer that the 10-j rule applied to option A, based on the plans to reintroduce Grizzly bears into the Canadian portion of the NCE.

The reasons for my preference are based on my study of the Selkirk Mountains Grizzly Bear Recovery area 2021 progress report and the North Cascades Ecosystem Draft Restoration Plan EIS. The introduction of bears into the Selkirk area has been marginally beneficial to the overall recovery efforts at best. The financial costs and the costs to the bears that were moved into the area or had to be relocated due to bear/human conflict post introduction is far too high for the nominal benefits. I think that the bears will suffer and conflict with humans will be more significant than the Draft EIS and FAQs are

acknowledging.

I do not think that the reintroduction plan is likely to be successful.

Habitat connectivity in the U.S. portion of NCE is increasingly fragmented and populated by humans. Grizzly bears face as many or more challenges immediately north of the U.S. border as they do to the south. The studies on the possible effects of climate change on an introduced population do not convince me that this plan has a high enough probability for success to justify the costs. More work needs to be done on habitat improvement and stabilization before a reintroduction is undertaken. Thank you for your consideration.

Correspondence: Subject: Urgent Plea to Prevent Grizzly Bear Reintroduction in Washington

To whom it may concern,

I am Grace. Im the Organizer of the Seattle Hiking and Professional Networking Group at Meetup.com. We are a hiking group with professional tech workers from Amazon, Microsoft and other professionals. We go hiking every weekend.

On behalf of the hiking group's 1105 members, Im writing to you with a sense of urgency and deep concern about the proposed reintroduction of grizzly bears in the North Cascades region, Washington.

While I understand the importance of conservation efforts, I firmly believe that reintroducing grizzly bears in Washington carries significant risks to the safety of hikers and people living around the areas and should not proceed.

Human Safety is Paramount:

Grizzly Bear Attacks: The potential for grizzly bear attacks on humans is a grave concern. Grizzly bears are formidable apex predators, known for their strength, unpredictability, and territorial nature. Encounters between bears and humans can lead to life-threatening situations. The safety of hikers and residents in reintroduction areas must be our top priority.

Evidence: Extensive studies and historical data show that grizzly bear attacks on humans are often severe and can result in injuries or fatalities.

Recent data and evidence from areas where grizzly bear populations have been reintroduced suggest an increased frequency of bear-human encounters, leading to a rise in grizzly bear attacks.

According to wikipedia.org, which shows a list of fatal bear attacks in North America, incidents of grizzly bear attacks have seen a noticeable surge in regions where reintroduction programs have been implemented.

For instance, Yellowstone National Park, states like Alaska and Montana, and places in Canada, which are homes to a grizzly bear population, have witnessed numerous bear-human conflicts, with several resulting in injuries and even deaths.

The safety of hikers should be a top priority, and we fear that the presence of grizzly bears in popular hiking areas could lead to unavoidable conflicts. These conflicts not only endanger human lives but also pose a threat to the bears themselves, as human-bear interactions often result in the euthanization of bears involved in attacks.

Please let hikers and the residents living there stay in peace. Why would you want to inflict fears and worries to people's life? The fears and worries of potential bear attacks because of the reintroduction of grizzly bears in human life just outweigh the

benefits of environmental conservation.

Economic Impact: The potential for bear-human conflicts not only endangers lives but also carries economic ramifications. In regions where grizzly bears are reintroduced, the fear of attacks can deter tourists, hikers, and outdoor enthusiasts. Businesses that depend on these activities could suffer financial losses, and local economies may face declines in revenue.

Alternative Conservation Strategies:

Habitat Preservation: Conservation efforts should prioritize the protection and restoration of existing grizzly bear habitats. This can be achieved in regions with less human population density, reducing the likelihood of conflicts.

Supporting Existing Populations: Instead of reintroducing grizzly bears into areas densely populated by humans, we can allocate resources to support existing bear populations in less inhabited regions. This would help ensure the survival of the species without exposing local communities to unnecessary risks.

Community Opposition:

Local Concerns: Many local residents and communities have voiced their opposition to grizzly bear reintroduction. They have legitimate concerns about the impact on their safety and way of life. It is imperative that these concerns are acknowledged and addressed.

Resource Allocation:

Efficient Resource Use: The financial and logistical resources required for grizzly bear reintroduction could be better spent on alternative conservation efforts. By investing in less risky strategies, we can protect the species without endangering the lives and livelihoods of those residing in reintroduction areas.

In light of these detailed concerns and the evidence of the danger that grizzly bears pose to human beings living around the area and hikers, I implore you to reconsider the reintroduction plan.

The responsible choice is to find alternative conservation strategies that do not jeopardize the lives and well-being of those residing in these areas. It is our duty to prioritize human safety while advocating for the conservation of these magnificent creatures.

Thank you for your attention to this matter. I look forward to hearing your response and hope for a reconsideration of this decision in the best interest of our communities and the grizzly bear's conservation.

Sincerely,

██████

Correspondence: I'm a female hiker, climber and backcountry skier. Introducing grizzlies in the North Cascades will fundamentally change the feeling and experience of recreating. They are apex predators. Even if the chance of a fatal encounter for any individual is low, it is a scary feeling knowing that it might happen, even if you're just lying in your tent at night like the couple in Banff this October. I'm worried this will reduce the hard won equity in the outdoors. I have little doubt that young guys and hardened gun carrying men will be not particularly worried about recreating in grizzly country. I know I would be scared, and many of my female friends would be too, perhaps because we are inherently more cautious even though we crush in the mountains. I would likely still venture into the mountains but not on my own and likely not on longer, harder more remote trips. I have been in Grizzly country in Alaska and Canada on backcountry expeditions. It is something I would undertake once a year with a larger group and experienced people, mostly guys. It would make me sad to see the growing equity in the outdoor community that welcomes people of all genders, experience levels and abilities curtailed, however unintentionally. I totally support Grizzlies having a habitat where they can thrive. However I feel Canada and Alaska with their vast areas of wilderness are more suitable for this. I support Option A. Even with that we will have some rare grizzlies in Washington given the Canadians will likely introduce some across the border. Let's see how that goes first before rushing things. Give us a chance to adapt.

Correspondence: As a citizen who lives very near the area of consideration to restore the grizzly bear population, I am in hope that the bears will someday exist in the North Cascades range. But given the EIS plan to add the USFWS 10(j) rule and this being the preferred plan by the NPS as well, I do not support the EIS to capture and move grizzlies to the North Cascades.

Under a 10(j) rule, grizzlies that are fully protected under the Endangered Species Act (ESA) in places like Montana could be taken from their homes, released into the North Cascades, and lose their previous protection. This is unethical and must not be allowed to happen.

The fact is, grizzly bears in the lower 48 states are threatened, and we don't have extra grizzly bears in the lower 48 states to capture and ship to the North Cascades, only to be killed.

A 10(j) rule makes it much easier to kill grizzly bears and treat a grizzly bear population in a way that the USFWS would not treat other grizzly bears in the lower 48 states.

A 10(j) rule also allows the USFWS to preclude any habitat protections which are necessary if bears are going to recolonize this landscape and eventually link up with other recovery areas.

A 10(j) rule also allows the federal agencies to avoid the normal ESA Section 7 consultation requirements, which otherwise require consultations among the federal agencies (in this case, especially the U.S. Forest Service) to avoid jeopardizing the grizzlies.

Unfortunately, USFWS hasn't done the legwork for preparing communities and recreationists for the arrival of grizzly bears through basic Bear Smart and coexistence measures, which just means that conflicts will be more likely--and the results will inevitably be dead grizzly bears.

For all these reasons, I oppose the reintroduction of the grizzly bears due to the planned use of a 10(j) rule for the proposed grizzly bear restoration work in the North Cascades.

Correspondence: I am strongly in support of restoration of a viable grizzly bear population in the North Cascades Ecosystem and support Alternative #3.

As a naturalist, hiker and backpacker, I have spent a lot of time hiking in the North Cascades and also in places with grizzly populations like Yellowstone. I believe that the health of the ecosystem depends on restoration of as many of our native species as possible and that both natural systems and human beings are deprived without keystone species such as grizzlies. It is not very difficult to learn to look for bear sign, to carry bear spray, and to keep a clean camp, and I feel this is a small price to pay for the chance to glimpse a grizzly bear in our mountain meadows.

Thank you for working to restore grizzlies.

Correspondence: The NO-ACTION ALTERNATIVE 'A' is the only reasonable path forward - "Continue with existing management practices".

The National Park Service and US Fish and Wildlife Service are proposing actions involving Grizzly bears that if enacted will have been implemented only through the agencies' willful contravention of Federal law, NPS Management Policy, and Washington state law. Both agencies are official Lead Agencies in the administration of the North Cascades Ecosystem Grizzly Bear Restoration Plan / Environmental Impact Statement (September 2023).

The National Environmental Policy Act (NEPA) requires Federal agencies to assess the environmental effects of proposed major Federal actions prior to making decisions. Federal law further mandates lead agencies that are privileged to publish Environmental Impact Statements to comply with the requirements of Code of Federal Regulations PART 1502 (Environmental Impact Statement). This process is required so that full and fair discussion of significant environmental impacts occurs. Clearly the public have been denied this opportunity. By its conduct and practice of omission of relevant information, and having concealed information from the public, intentional information hiding that has direct consequences to public safety, the National Park Service and US Fish and Wildlife Service are in violation of both NEPA and CFR Part 1502.

Grave consequences resulting from any agency Record of Decision that would place Grizzly bears onto public lands will include unnecessary human deaths and injuries to the public. Despite the available statistics of historical injuries and deaths available to NPS and FWS both of these agencies have been silent on these threats in the subject EIS as well as in public meetings that are now concluded. Withholding relevant information from the public, especially where that information is material to, and represents threats to public safety, is a serious breach of the public trust, one which will result in tragic outcomes to those who have been led astray by these agencies.

Examples of "information hiding" include empty bear spray canisters having been found next to the dead bodies of those killed by grizzlies; or despite viable populations of Grizzlies in Montana, Wyoming, and Idaho, the U.S. Fish and Wildlife Service has ignored petitions by these three states to delist the Grizzly; or that the previous Director of U.S. Fish and Wildlife Services stated before Congress that the grizzly is biologically recovered. The Director stated this based on the thousands of Grizzlies in Montana, Wyoming, Idaho, and Canada. In other words, for many years the Grizzly bear species has enjoyed a full recovery in these recovery zones and through their prolific breeding and enormous range expansion the management programs of NPS and FWS have been shown to be completely inadequate as evidenced by the increasing deaths and injuries, the majority of which are occurring outside recovery zone boundaries on private lands.

Citations of NEPA, CFR Part 1502, NPS Management Policy, and Washington state law:

Pursuant to CFR Title 40 Chapter V Subchapter A, Part 1502.2(b) states, "Environmental impact statements shall discuss impacts in proportion to their significance."

Pursuant to CFR Title 40 Chapter V Subchapter A, Part 1502.2(f) states, "Agencies shall not commit resources prejudicing selection of alternatives before making a final decision."

In accordance with NPS policy at Section 4.4.2.2 of the 2006 Management Policies Manual states: "The Service [NPS] will strive to restore extirpated native plant and animal species to parks whenever all of the following criteria are met: 2) The species does not, based on an effective management plan, pose a serious threat to the safety of people in parks, park resources, or persons or property within or outside park boundaries."

Section 1.9.1.4 of the 2006 NPS Management Policies manual emphasizes that human life must not be compromised, rendering analysis in the final NCE/EIS a necessity, and states: "The safety and health of employees, contactors, volunteers, and the public are core Service values. In making decisions on matters concerning employee safety and health, NPS managers must exercise good judgment and discretion and, above all, keep in mind that the safeguarding of human life must not be compromised."

The Revised Code of Washington (RCW 77.12.035) unambiguously prohibits transplantation or introduction of grizzly bears into the State, including Federal initiatives. RCW 77.12.035 states in part - "Grizzly bears shall not be transplanted or introduced into the State. Only grizzly bears that are native to Washington State may be utilized by the department for management programs."

Consequences of Grizzly bear attacks

As indicated herein, the following news reports are the consequences of Department of Interior out-of-control Grizzly bear

recovery programs, yet they represent a small subset of the number of actual incidences and severity of Grizzly attacks against humans and livestock.

Correspondence: I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C: Restoration with Section 10(j) Designation. Alternative C is the best choice for bears and the people who live in and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you for taking the time to keep our North Cascades wild!

Correspondence: I live in an area where Grizzlies are wanting to be re introduce. First, after reading the report, I don't see any proof that it will help our eco system. Where is the proof that it will help and bring balance?

Second, one of the only reasons I see the the benefit of re introducing grizzlies is because they were here before. When they were here, there were no major roads, increases population, and tourism. The eco system has also changed since they have lived in the area.

Third, what is the cost benefit of bringing them back. It will take a lot of man hours and money we do not have.

With these reasons, I am in favor of not reintroducing grizzlies to Washington State

Correspondence: The purpose of the North Cascades Ecosystem (NCE) Grizzly Bear Restoration Plan / Environmental Impact Statement (Plan/EIS) is to restore the grizzly bear to Washington's NCE, preferably with Alternative C, which includes a 10j-designated nonessential experimental population (NEP). Alternative C provides greater management flexibility in managing grizzly-human conflict situations.

My comments are:

- The Plan/EIS is responsive to NEPA requirements. It involved a great deal of communication, responding to earlier comments, and thorough evaluation. In my opinion, a great deal of dedicated effort by many people went into preparing the Plan/EIS and 10j documents, and identifying Alternative C (10j) as the Preferred Alternative.
 - I too prefer Alternative C for restoring the grizzly bear to the NCE. It seems to be the most effective plan and therefore has the best chance of succeeding.
 - Please move quickly to complete the ROD and 10j rulemaking.
-

Correspondence: I am in favor of the Grizzly Bear Restoration plan. Grizzlies are indigenous to the North Cascades and its ecosystem. They can thus thrive there, and help the ecosystem thrive as well. Reintroducing them will also help to restore the Grizzly Bear population in North America more generally and reduce their endangerment. These are beautiful spiritual species and their presence benefits us all.

Correspondence: Grizzly bears belong in the North Cascades. They lived on those lands and waterways long before the devastating impacts of colonization. Traditional knowledge and western science supports reintroduction as means to revitalize the ecosystems that are always under threat. Grizzlies are an essential predator to north cascades and with collaborative co-management with the tribes, state agencies, ranchers and rural residents, there is a pathway for living near and with them.

I grew up in the Cascades - hiking, fishing and camping. As an adult, I spend my entire summer in the North Cascades climbing in the most remote parts of the mountains. The forests, talus slopes, rivers and peaks are not mine to possess or control, they are the grizzly's - I'm a visitor. Rather than operating from a place of fear, I hope folks will support the reintroduction of these vital predators to their original homelands.

Correspondence: Grizzly bears should not be re-introduced to the North Cascades. There are two reasons for this:

1. Grizzly bears, by any objective measure, are no longer endangered. The population of grizzlies in the area of Yellowstone National Park has increased from 136 at their low point to an estimated 728 today. That's more than a five-fold increase. Meanwhile, there are some 16,000 grizzlies living in British Columbia and 31,000 in Alaska. By no stretch of the imagination can populations of these bears in such numbers continue to be considered "endangered." Thus, there is no compelling reason for the re-introduction of grizzlies into the North Cascades.

2. Grizzly bears threaten human hikers and campers. Yes, it is true that encounters between grizzly bears and humans are very rare. However, when such an encounter does occur, the likely result is death to the human. Furthermore, even in the absence of any actual encounters, the fear factor is significant and carries its own weight. Even those who advocate for the re-introduction of grizzly bears advise hikers to "be aware," to stay alert to the terrain and to whether it's possible to see around the next bend, to lookout for bear tracks, to stay away from noisy streams that could drown out the sound of approach, to make noise like hand clapping or bell ringing, and finally, to carry bear spray. None of this advice comes for free. Doing any of these things carries a real cost in degrading the experience of a pleasant, anxiety-free, and peaceful hike. Wildlife experts are, in effect, asking hikers and campers stay on high-alert while in the backwoods, to engage in behaviors that meaningfully reduce their enjoyment, and to be apprehensive rather than serene. None of this would be significant were grizzlies actually endangered but, since they are not, it cannot be justified.

Please do not make the hiking and camping experience in the North Cascades materially worse in pursuit of an unnecessary goal.

Correspondence: Comments on the North Cascades Ecosystem Grizzly Bear Restoration Plan EIS:

The document failed to analyze the true impact of grizzly bear introduction and ultimate grizzly bear populations on the human environment.

- Public safety and other impacts were often approximated based on data from other Grizzly Bear Recover Zones (GBRZs), but unlike the North Cascades Ecosystem (NCE) none of these are immediately adjacent a major population center like the

Puget Sound Basin. Additionally, several heavily used highways access the very heart of the NCE namely, SR 20, US 2 and I90. The hundreds of overflow-vehicles lining SR 20 on weekends around trailheads is a testament to the intense recreational interest and use of these wild lands. Lines of hikers and their dogs use the popular trails along the crest of the Cascades. Estimates of use in this area are underestimated if only because not everyone signs the trail logs. The EIS seems to rely heavily on Yellowstone Park statistics regarding bear/person interactions citing the park's large visitor use. However, the data doesn't reveal that the great majority of those visitors are primarily driving along the roads and hiking heavily used boardwalks to popular hot spring features. You can't compare experience at Yellowstone Park to the NCE, Yellowstone has been in the business of people & bear Management for over a hundred years. Also, unlike Yellowstone the NCE has no big herds of ungulates to prey upon.

- The EIS underestimates the likely impacts to access caused by the ultimate grizzly bear populations. Road closures are common in other GBRZs to protect the animals, especially during the spring season.
- Public education will not necessarily prevent bear/person interactions because prevention techniques are often ignored by recreationists (note innumerable photos posted to the web).

The EIS fails to analyze the potential for introducing invasive species into our most pristine wilderness and Park lands here in the Cascades. Bears and the traps will be transported from areas far away from the NCE, likely from areas know to have invasive weeds and animal/human diseases. What is the potential for spreading invasive species (plant & animal) and diseases (ie, tick-born or hoof/chronic wasting disease) on or in the traps or helicopters, or in the bear's feces or fur?

The document suggests that there is great value in returning the grizzly bear, a so-called apex predator, more quickly to the NCE than it would occur under the no-action alternative. This argument is not convincing. There exist no great herds of ungulates in NCE which are in desperate need of control. And, even so, healthy and widely distributed populations of other large predators are already present; black bears, cougars and wolves. The claim is made that some people will feel good just knowing the animal is roaming the country. There are those that get the same romantic feeling about free-roaming wild horse and burro herds ranging across the West. Unfortunately those populations are wreaking havoc on the range lands managed by the US Bureau of Land Management and US Forest Service. Despite real and ongoing resource impacts the agencies' attempts to manage that situation has utterly failed, stopped dead. (Perhaps there is where the grizzly bears should be shipped).

We fiercely support the No-Action alternative. If, as the EIS claims, the NCE is so attractive for grizzly bears, they will come on their own and there will be no guilt or blame. We have no confidence that the agencies will properly manage an "experimental population" of grizzly bears in the best interests of the people that are most likely to be affected, recreationists, ranchers, farmers and the local residents. Like Washington wolf "management" the effort and the cost will more likely be placed on the farmer or rancher to manage the bears. And any effective management action proposed by the agencies will no doubt be stymied by special interests welding the T&E Species Act.

Correspondence: I am in support of the re-introduction of grizzly bears to the north cascades ecosystem, however I think that there are some issues that need to be seriously considered in relation to the re-introduction. I think that human disturbance to the ecosystem from monitoring should be as limited as possible to prevent the disturbance of organisms living in the north cascades that could be sensitive to noise or other human disturbances. Also, I think increase public education about grizzly bear safety is crucial to preventing harm to humans and bears.

Correspondence: Both alternatives B and C have a goal of 200 bears. The whole purpose of the EIS is to work toward a population of 200 bears yet the EIS does in no way support that number. I see nothing in the in the EIS that supports the longer term goal of 200 bears or the 5 to 10 year goal of 25 grizzly bears. I would think with the stated goals of alternatives B and C that the EIS should clearly justify those numbers in great detail. I don't see that in the EIS.

The accepted definition for a population is evidence of 2 adult females with cubs or 1 adult female tracked through two litters. A reasonable alternative may to introduce of 2 adult females with cubs or 1 adult female tracked through two litters and manage them under section 10(j) of the ESA. After the initial relocation to meet the accepted definition for a population there would not be any need for more relocations. Maybe the longer term population would be better at 10 bears rather than 200 bears. With something like 60,000 wild grizzly bears are already located throughout North America it makes no difference if there are 10 or 200 bears in the north Cascades and 10 would be easier to manage and have less of an adverse impact on other uses in the area. The EIS should clearly support the number of bears relocated and the goals of the project.

The EIS does not adequately address the impact on recreation that introducing 200 bears will have. I see that in the bear management areas in Yellowstone that there are significant multiple month periods of use restrictions on recreational faculties. In Yellowstone to reduce encounters between bears and humans, the park restricts certain activities in many areas. Restrictions may include area closures, trail closures, a minimum group size of four or more people, day use only, or no off-trail travel. I don't see any place in the EIS where any similar restrictions were discussed. I would think that introduced grizzlies in the north Cascades would come with significant impacts on recreation.

Correspondence: As a resident of WA state I am vehemently against this, I do not think this is a good idea at all to reintroduce grizzly bears into the ecosystem. It is very sad that they do not freely roam anymore in WA, but the answer is not to then unnaturally add them back in. As a former resident of WY I know well how detrimental it was to wild life when wolves were reintroduced and know there have been issues in CO for the same reason. Reintroducing grizzlies would have a major impact on the existing wildlife (leading to a decrease in the natural prey in the areas) in WA and most likely the human population as well. Sadly, the people of WA are not accustomed to grizzly bears and I think it would be dangerous to reintroduce them, this is already an issue in WY especially with non locals not understanding the danger of these wild animals.

Correspondence: I am opposed to the restoration of grizzlies in the North Cascades. One inevitable outcome of a negative human to bear interaction will be trail closures and reduced access. Alberta pursued a similar initiative in Banff in a high human use area and indeed lengthy closures ensued. The North Cascades region already has a rather short practical visitation season that is shrinking as the duration of smoke season lengthens. Meanwhile, the population of Washington State, and therefore visitation and recreation in the area, will only continue to rise. I believe resources will be better spent preserving the existing populations of thousands of grizzlies in places such as rural Alaska, British Columbia, Yukon, etc. where fewer humans reside rather than spent attempting to establish a new very small population in the North Cascades.

Correspondence: I understand the benefits to habitat of reintroducing grizzly bears to the North Cascades. However, I have great concerns about the benefits to the grizzly bears if reintroduced to the North Cascades. Their "original" territory is no longer what it once was. It is now cut by a highway as well as many smaller roads. There are more people living in what was once bear country. There are myriads of hikers traipsing throughout the North Cascades, particularly the 1000+ annual PCT hikers. Inevitably, there will be human-bear encounters that will not work out well for neither the humans nor the bears involved. Any negative outcome from a human point of view will result in the destruction of the bear. Or the bear who the humans think is the bear involved, but may, in fact, not be said bear. Bears who become problems, due to their encounters with humans, will be killed. Bears who are mistaken for problem bears will also be killed.

Another consideration that the "original" territory and habitat is being markedly altered by climate change. While there are over a half million acres in the North Cascades, there have also been massive fires that have destroyed the habitat and made it unlivable for bears (and others) for many years. Who knows if these burned areas will ever restore themselves to good bear habitat or if the population of bears will find themselves with less and less available territory. This will not bode well for the bears themselves and will push them into increased encounters with the humans who will also have less territory for recreation and living.

I have concerns that this effort to reintroduce grizzlies to the North Cascades is being done to make the humans feel better rather than to truly benefit the bears. We need to be honest about the current situation and look at the grim future that lies before us.

I support Option A: do nothing. However, if grizzly bears do find their way into the North Cascades, I would support enacting a rule under section 10(J) of the Endangered Species Act at that time to allow agencies more flexibility in dealing with the bears.

I do not support Option B at all.

If it is inevitable that grizzlies are reintroduced, it must be with the additional rule under section 10(J) to allow best possible outcomes for the bears.

Thank you for considering my remarks.

Correspondence: Washington state has the most dense population of all western states. Even the most remote parts of the state receive droves of outdoor recreation seekers. Therefore it is my opinion that the forced re-introduction of the grizzly bear will lead to a loss of human life. I think it is inevitable that grizzly and humans will cross paths often, an example of this occurred in Stevens County this fall, when a juvenile grizzly broke into a hobby farm chicken coop. Also, the re-introduction of grizzly bears would only further polarize, small communities against government " idealist" policies (they already think we have a predator management issue in this state).

I am a hunter that is for gun control. I am concerned that the re-introduction of grizzly bears would also give Second Amendment radicals another reason to claim they need semi automatic weapons to protect themselves. I do not own a handgun, but even myself would have concern venturing into grizzly country with only bear spray and a hunting rifle.

Correspondence: I do not support bringing in grizzly bears into Washington State. I believe it is an irresponsible thing to do. For the safety of all users of our back country trails and surrounding private lands, livestock, etc. I must voice my concerns.

If these bears were not born in our state, then why should they be relocated here, in an area where the people who live here clearly don't want them.

I don't understand the reasoning. Many users don't want the bears and it makes me wonder who benefits from this? It's certainly not the public. And it's not the confused bears, being disrupted from the only environment they know, to an

unknown location.

How many of these bears will die because they cannot adjust to the unknown area? How many will try to return to where they were born. How many will need to be killed because they became a killer of livestock, just trying to survive? How many will be illegally hunted for sport? How many will injure or kill innocent people using public lands?

Why don't the public have a solid voice in making decisions? Why does a few individuals get to decide for the rest of us who actually live and use these public lands, who oppose the relocation of bears?

For several years, I packed tools for the Naches Forest Service. I also packed thousands of trout into the high mountain lakes for the Naches Hatchery. I continue to volunteer with BCHW, doing trail maintenance work parties throughout the year. I'm an avid packer and packing instructor. And I do not want to see the introduction of grizzly bears that weren't born here.

Correspondence: TO: NATIONAL PARK PLANNING/NCE GRIZZLY
RE: RE-INTRODUCTION OF GRIZZLIES, TO WA

I am against it. Though I know, that sometimes Grizzly bears have positive interactions with humans, this is exceedingly rare.

We are trying to do our salmon recovery. I personally think that this would be far less controversial, and far less dangerous. I have native American relatives: a niece, nephew in law and great nephew, who are native Americans. And, they love fishing for salmon.

It really does seem to me, that re-introducing Grizzly bears would hurt our salmon recovery, because Grizzly bears love

eating salmon.

Also, the North Cascades Forest is near the North Cascades Highway. And, this could cause some fatal auto crashes.

Bears do not have a good sense of personal boundaries. They have been known to enter homes, even with closed and locked doors. They will not stay within the boundaries of the forests. They will go where they want to go.

I do not think that people would feel safe, to go camping, in the Met-how area, or in the Conconully area, if bears were re-introduced here. I know, that I personally would not.

I personally would have no problem with some of the bears wandering here on their own, from Canada. But, I would not wish to have them intentionally placed here, in a group.

Though our state law is not legally binding, at a federal level, I think that this should make our feelings and wishes quite clear. We do not want them here. We are the ones who would have to deal with the results of this, because they would be in our area.

I think, that what we resent, is having this imposed on us, by unelected bureaucrats. This is very hurtful to us. We feel a bit forced, and exploited, by this.

Sincerely,

Omak, WA

Correspondence: Thank you for the opportunity to comment on the Draft Grizzly Bear Restoration Plan / Environmental Impact Statement for the North Cascades Ecosystem (NCE). As someone who lives and recreates in the heart of the NCE recovery zone, I am keenly interested in this project, and recognize that it may affect me personally. My property is in the

Twisp River watershed, and adjoins U.S. Forest Service (USFS) land. When not at home, I can often be found hiking, running, skiing, and backpacking on USFS lands throughout the northeastern portion of the NCE.

I support restoration of the NCE population of grizzly bears, but have some concerns about your proposed action. First, the biggest threat to grizzly bear recovery in the NCE as it see it is conflict with humans - specifically, conflict arising from predator intolerance and people's reluctance to change their behavior for the protection of humans and bears alike. I feel the EIS glosses over this important issue. Second, I am concerned about the proposed 10-J rule for this population, as it provides a loophole for people opposed to the plan to lawfully kill grizzly bears, and for the USFS to implement large-scale land management projects without needing to consult with the U.S. Fish and Wildlife Service (USFWS) regarding these actions' effects on this species.

To flesh out my first concern, the NCE recovery zone is not yet very "bear aware," and I do not see any consequences in place for people whose actions lead to black bears getting habituated and ultimately killed. Here in the Methow Valley, while some landowners and communities have made a concerted effort to minimize bear conflicts through proper food and garbage storage, electric fencing, and other means, countless others have not. Last year, a neighbor shot and killed a black bear who walked into their carport, where their garbage was stored (Methow Valley News 2022). As far as I know, they did not receive a citation of any kind - and in fact, I am not aware of any food storage orders in place where I live. According to the EIS, both action alternatives will entail "improved sanitation on public lands," but few actual changes are proposed. The short discussion of this project element on page 32 mostly identifies measures that will "continue to be implemented"; the only new measures I could find were required signage at developed campgrounds and prominent trailheads, along with the suggestion that food storage orders by the USFS "may be required."

This is not enough. The proposed action should include focused collaboration with the USFS, Washington Department of Fish and Wildlife (WDFW), county agencies, and other decisionmakers to ensure that grizzly bears will not be introduced into a population sink of bad human behavior. The outcome will hopefully be a combination of incentives (e.g. bearproofing assistance), legal mechanisms (e.g. food storage orders and enforcement thereof), and public awareness campaigns to prime people for coexistence with grizzly bears and improve outcomes for people and bears alike.

On to my second concern, about the 10-J rule. The EIS implies that the 10-J rule is necessary to allow for "deterrence, incidental take, research and recovery actions, relocation of grizzly bears, preemptive relocation to prevent a conflict that appears imminent or in attempt to break habituated behavior of bears lingering near human-occupied areas, and conditioned lethal take" (see Executive Summary page iv). But in reality, all of these actions are permitted under existing ESA mechanisms applicable to grizzly bears, i.e. the Section 4(d) special rule, Section 10(a)(1)(A) recovery permit program, and Section 10(a)(1)(B) incidental take permit program. In other words, these actions may be lawfully undertaken without the proposed 10-J rule, and are routinely done so in other ecosystems where no 10-J rule is in effect.

But where the proposed 10-J rule departs from existing ESA mechanisms is on the "conditioned lethal take" front, in that it establishes more scenarios in which private citizens can kill bears or ask wildlife managers to kill bears at their behest. In Washington, this is no small thing. A vocal minority of ranchers has taken a serious toll on wolves, both within and outside of the law. A single rancher rattling cages at WDFW resulted in that agency's lethal control of 29 state-listed wolves between 2012 and 2020 (National Geographic 2020), notwithstanding a generous compensation program for livestock depredations (WDFW 2023), and the fact that the rancher's cattle are grazed on the Colville National Forest. Another prominent ranching family close to my own home in Twisp are convicted poachers of ESA-listed wolves (Seattle Times 2012). Anti-predator sentiment is alive and well in and around the NCE, and I think that resource agencies are too focused on appeasing these interest groups. The proposed 10-J rule feels like an example of this -- and it sets the stage for more appeasement in the future.

That the 10-J rule means the USFS can skip Section 7 consultation for grizzly bears in their large-scale land management projects is also an issue for me. Locally, I've been quite concerned about several forestry projects being implemented by the Methow Valley Ranger District. Although the projects all have restoration components, they also establish extractive commercial thinning operations, the results of which may now be viewed in the Buttermilk and Libby Creek drainages and resemble clearcuts more than selective harvest. . These projects will result in landscape-scale modification of NCE grizzly bear habitat, and may conceivably also result in the take of individual bears. It is critical that the USFS be required to consult

with the USFWS on the potential effects of these projects on grizzly bears, and that the USFWS be given a mechanism, through the Section 7 process, to impose project-specific protective measures for this species.

In conclusion, I support Alternative B, but with additional project elements folded in to improve human behavior in the NCE recovery zone prior to and during the translocation effort. Thank you for your time and consideration.

Correspondence: I am very strongly opposed to air dropping grizzly bears in the Cascades which includes a major portion of Okanogan County. It is certain that the bears will migrate to the Sinlahekin and Similkameen Valleys in search of food. Which is where we live, work raise our families and food to feed the city people who think this such a nifty idea. As a livestock producer I already deal with three predators, cougars, wolves and black bears. I have livestock losses each year from cougars and every few years from black bears. We do not need another apex predator in our county. Our family moved to this valley about 110 years ago and it has only been in the past few years we have faced wolf and cougar predation and now it is increasingly frustrating our government and the enviors are dumping another apex predator on us.

This seems to just be another loosing battle in the war on the West, and is frustrating because the interviews and press releases would have us believe this already a done deal, and this comment process is just so the agencies can check a box and the concerns of folks who will have to live with bears really have no say in the matter. We passed a state law to prevent this from happening and this disregarded as well.

The arguments for grizzly are weak, subjective and silly "It will complete the wilderness" or "it will cultivate the wilderness leading to greater biodiversity". What it will do is make the agencies and folks in their condos feel warm and fuzzy, while those of in the recovery area face livestock and human predation, regulations on our day to day activities and a sense of caution or fear as we go about our lives. And understand we will defend our families and livestock from these predators if necessary.

Correspondence: I think introducing grizzly bears to the north cascades would be great. I definitely think that most people would be and are scared of the grizzly bears attacking them and their animals, but under the ESA section 10(j) it would be easy to take out bears that attack people or who are aggressive. Seeing and knowing that grizzly bears are roaming free in the mountains would make me very happy, because traveling in the backcountry of the north cascades is an incredibly rewarding experience mostly due to the animals and wildness that they foster, and grizzlies would only add to that appeal. Grizzly bears would create a very healthy and ecologically rich environment for everyone to enjoy, and my pride for my home mountains would skyrocket; I would not hesitate to recreate in the north cascades.

Correspondence: The salmon runs that sustained the original Cascade Grizzly bear populations no longer exist in sufficient quantities. Grizzlies prefer to reside in valleys along waterways. Given the human population density in the lower areas adjoining the Cascades, confrontations will be a big problem. I am very familiar with the growing Grizzly problem in the State of Montana. There are now too many bears. Bringing more to the Cascades at this time is asking for trouble.

Correspondence: I am thrilled and fully endorse the reintroduction of grizzly bears to the North Cascade range in Washington State. These magnificent creatures were once a natural part of this habitat until extensive hunting nearly wiped them out. For thousands of years, they played a crucial role in this ecosystem. Let's responsibly steward the natural beauty of this region and restore the biodiversity that was present until recently.

To that end, I give my support to the proposal "Alternative C: Restoration with Section 10(j) Designation." The proposal would bring up to 25 non-problem grizzly bears into remote areas of the North Cascades over the next decade and manage them as an experimental population.

Thank you,

Correspondence: I oppose entirely to the plans of re-introducing grizzly bears in Washington state. The re-introduction of grizzly bears in Washington raises legitimate concerns for our safety and enjoyment of outdoor activities, such as hiking and backpacking in the beloved North Cascades.

Grizzlies, considered more dangerous than black bears, pose a higher risk due to their larger size, aggressive behavior and greater strength. Their confrontational nature sets them apart from the generally more cautious black bears. Furthermore, grizzly bears have longer claws and robust build, potentially leading to more lethal attacks.

Incidents, such as the recent tragic case in Canada where a couple was fatally mauled by a grizzly bear despite using bear spray, highlight the inadequacy of such deterrents against grizzlies. The prospect of needing to carry firearms for personal safety during hikes is an unwelcome consideration. It not only disrupts the peaceful enjoyment of nature but also introduces additional dangers on the trails.

I would like to continue enjoying the beauty of the North Cascades and all the hikes in WA without concerns about encounters with aggressive and dangerous wildlife. The possible re-introduction of grizzly bears could deter us from exploring and enjoying these areas / national park.

Correspondence: I am writing to support Grizzly Bear recovery efforts In the great North Cascades Ecosystem including the National Park and adjacent wilderness and recreation areas. As I have written to support past efforts to restore this fascinating and charismatic bear to it's former range in past years, I do so again today. I have lived with brown and grizzly bears working for Katmai and Denali National Parks as well as southeast Alaska, where the bears are abundant. I know the joy as well as the challenges it takes to coexist with such mighty creatures. The beauty and fascination of sharing space with Brown Bears in Katmai at close range, as well as McNeil River Brown Bear Sanctuary, make me a constant advocate for bringing back the bears to the North Cascades and importantly educating the public about them, not letting fear-mongering or foolishness misinform the public. It is critical the public understand the real animal, not just the exaggerated stories and worst outcomes some would have one believe are every day experiences in bear country . I was in contact with brown bears daily at Katmai for four full summers and Denali for a summer working and daily hiking as well as five summers visiting and backpacking there. Interactions with the bears were always exhilarating, and some of the very best times in my life in the

backcountry as well as around the camp community. People and bears can coexist with a little effort to learn about their habits and ours.

I support The Alternative C proposal with the 10j designation and rule to best bring back the bears. To find a bear or two some day on a slope in the high cascades, back in a place they once roamed is an objective worthy of all the repeated efforts of supporters who refuse to give up. Count me in.

Thank you for the opportunity to make my voice heard,

Former backcountry ranger and Naturalist in Katmai, Denali and volunteer at McNeil River, naturalist guide in Prince William sound and southeast Alaska.

Correspondence: Although I consider myself a wildlife and habitat conservationist, I do not approve of this move to reintroduce the grizzly bear to the North Cascades. I'm a huge supporter of introducing wolves, supporting the wolverine population, etc. I even feel that natural reintroduction of grizzlies is fine, (i.e., if they cross in from Canada or Idaho). However, I simply know that grizzlies are much more aggressive to humans than the typical black bear. In Idaho, Montana, Alaska, and Canada (grizzly bear zones), these areas all have greater contiguous wild lands to support grizzlies and prevent less people-bear contact. There are many more hikers and recreators (i.e., Western WA population) in a smaller land mass.

Likely, there will be more encounters. Importantly, many of these recreational hikers have little knowledge of grizzlies and their more aggressive behaviors, as compared to black bears, (particularly mothers/cubs; during mating season; searching for food before winter). There is a reason that hunters and hikers in Idaho, MT, and Alaska all carry guns. Bear spray is only effective when a grizzly is not determined.

I think this policy is naive. Black bear do many of the same things that grizzlies do - dispersing seeds, digging grubs, omnivorous behaviors. However, they typically don't threaten human life during encounters. Obviously, grizzlies don't always threaten human life, but their huge size and more aggressive behaviors create unnecessary risks. For Wa State and U.S. Forest Services not to add bear boxes and places to raise backpacks on hikes and camping areas, if there is a reintroduction is also irresponsible.

Correspondence: To Whom It May Concern:

I'm an avid hiker and a hike leader for hundreds of folks through Meetup and Facebook groups. I love feeling safe outdoors, but strongly believe we should reintroduce grizzlies to their former home(s) and use whatever strategies likely successful to see if we can replenish their populations. I have come to understand the difference between "selfish" and "self-care." Selfish is what some simplify to mean putting one's "wants" above others' (and other species' or the ecosystem's) "needs", while self-care is putting one's needs above another's wants. This concept helps me know where I stand when thinking about the impact and waged power differentials of humans upon each other and the world in which we live, including when talking about the reintroduction of grizzlies into their former home of Washington.

Grizzlies and other wildlife that are endangered are often largely (if not entirely) in a state of decline because of our arguably "selfish" human behaviors. We build and build and build, and hunt and push indigenous species into smaller and farther corners as we propagate and take over, eat up their food supplies, and so on -- almost parasitically. For centuries, others who acted as better environmental stewards lived with the idea of looking back and forward "seven generations," taking only what they needed and nothing more so that they could honor the past and sustain the future. This helped maintain a balance and harmony with and respect for wildlife, showed gratitude to our ancestors and cared responsibly for our progeny.

While I love to finish a hike alive so I can go again the next week, I hike knowing there are always risks -- from black and brown bears to wild cats to wildfires to rolling my ankle and falling off a cliff. While grizzlies are no joke, I do not think my or anyone else's comfort and safety trump their survival. If they were declining absent unnatural human impact, that would be one thing. But it is because of us that we have this issue, and we can't keep making the same selfish decisions. We also cannot do nothing and act like we aren't complicit if grizzlies don't show an uptick in their numbers despite being given a bear version of a reservation to adapt to.

We must make reparations for the past and be better stewards of the earth -- including for each another and across species. Otherwise, how are we any different from a bully doing whatever they want because they hold more power? How is this different than pushing the indigenous peoples from their lands onto other lands and expecting them to adapt? Why is our thriving more important than their survival? Our comfort and convenience more important than their existence? And what eventual larger, unknown impact might this have on the overall ecosystem that ends up biting us back?

I recognize that we are built with an innate lizard brain and the fight or flight response, and shifting towards higher risk is unnerving. That said, I also greatly fear a world where we recklessly solve complicated issues with regard for our wants over others' needs, where we seek the greater safety of the rampant species over the one spiraling towards extinction.

Absent other solutions and alongside a responsible implementation of their reintroduction into Washington State and elsewhere, I SUPPORT bringing grizzlies back here to their previous home. I thank you for your consideration of my opinion and through review of the evidence and others' arguments for or against this policy.

Correspondence: I am a hard NO!

It's absurd to call this a "Reintroduction", grizzlies reside along the border now, nothing good will come of having more grizzly's in Washington. We already have major ISSUES with predator's, black bears, cougar, Wolves, even the coyote population has increased. All while the ungulate population decreases. The amount of interactions between black bears, cougars, Wolves and people has increased. Why would we want to further complicate this problem, this proposed plan lacks common sense and is based on emotion.

The "reintroduction" and management of Wolves is deceitful. It's not difficult to image this project going any different.

We most certainly don't need more grizzly's in Washington,

Correspondence: I fully support the return of Grizzlies to the North Cascades. This must be done in a way that is compatible with the Wilderness Act and the Endangered Species Act(ESA). I oppose the use of a 10(j) rule for the restoration of Grizzly bear populations. Grizzly bears deserve full ESA protections, in the lower 48 states. Helicopter flights and collaring for continuous harassment of bears that have been abducted, drugged, and stranded in an unknown Wilderness with no protections from would-be slayers, is no way to ensure the restoration of healthy bear populations. Stealing Grizzly bears from their home range and forcing them upon an unsuspecting ecosystem would hurt both environments, while stifling population recovery efforts that have taken generations to come to fruition.

Stop installing infrastructure in Our wilderness areas!
Stop taking motorized vehicles beyond the borders of Our Wilderness!

Before long, Grizzlies may soon repopulate the North Cascades of Washington by their own accord. So, recovery efforts would be better spent ensuring sufficient wildlife corridors are present, for bears to freely traverse the U.S./Canada border. Aid communities in the region, and visitors, by providing resources and training in BearSmart practices.

We will never be in a better position than the Grizzly bear itself, to decide the best place to roam. Any Grizzly in "the Lower 48" deserves full protections under the ESA. Stop managing Our Wildernesses and utilize ethical stewardship practices! Include all locally relevant Tribal nations and communities in decision making, especially as it pertains to Grizzly bear population recovery efforts.

Thank you for your attention.

Correspondence: Comments on the North Cascades Ecosystem Grizzly Bear Restoration Plan EIS:

The document failed to analyze the true impact of grizzly bear introduction and ultimate grizzly bear populations on the human environment.

- Public safety and other impacts were often approximated based on data from other Grizzly Bear Recover Zones (GBRZs), but unlike the North Cascades Ecosystem (NCE) none of these are immediately adjacent a major population center like the Puget Sound Basin. Additionally, several heavily used highways access the very heart of the NCE namely, SR 20, US 2 and I90. The hundreds of overflow-vehicles lining SR 20 on weekends around trailheads is a testament to the intense recreational interest and use of these wild lands. Lines of hikers and their dogs use the popular trails along the crest of the Cascades.

Estimates of use in this area are underestimated if only because not everyone signs the trail logs. The EIS seems to rely heavily on Yellowstone Park statistics regarding bear/person interactions citing the park's large visitor use. However, the data doesn't reveal that the great majority of those visitors are primarily driving along the roads and hiking heavily used boardwalks to popular hot spring features. You can't compare experience at Yellowstone Park to the NCE, Yellowstone has been in the business of people & bear Management for over a hundred years. Also, unlike Yellowstone the NCE has no big herds of ungulates to prey upon.

- The EIS underestimates the likely impacts to access caused by the ultimate grizzly bear populations. Road closures are common in other GBRZs to protect the animals, especially during the spring season.
- Public education will not necessarily prevent bear/person interactions because prevention techniques are often ignored by recreationists (note innumerable photos posted to the web).

The EIS fails to analyze the potential for introducing invasive species into our most pristine wilderness and Park lands here in the Cascades. Bears and the traps will be transported from areas far away from the NCE, likely from areas know to have invasive weeds and animal/human diseases. What is the potential for spreading invasive species (plant & animal) and diseases (ie, tick-born or hoof/chronic wasting disease) on or in the traps or helicopters, or in the bear's feces or fur?

The document suggests that there is great value in returning the grizzly bear, a so-called apex predator, more quickly to the NCE than it would occur under the no-action alternative. This argument is not convincing. There exist no great herds of ungulates in NCE which are in desperate need of control. And, even so, healthy and widely distributed populations of other large predators are already present; black bears, cougars and wolves. The claim is made that some people will feel good just knowing the animal is roaming the country. There are those that get the same romantic feeling about free-roaming wild horse and burro herds ranging across the West. Unfortunately those populations are wreaking havoc on the range lands managed by the US Bureau of Land Management and US Forest Service. Despite real and ongoing resource impacts the agencies' attempts to manage that situation has utterly failed, stopped dead. (Perhaps there is where the grizzly bears should be shipped).

We fiercely support the No-Action alternative. If, as the EIS claims, the NCE is so attractive for grizzly bears, they will come on their own and there will be no guilt or blame. We have no confidence that the agencies will properly manage an "experimental population" of grizzly bears in the best interests of the people that are most likely to be affected, recreationists, ranchers, farmers and the local residents. Like Washington wolf "management" the effort and the cost will more likely be placed on the farmer or rancher to manage the bears. And any effective management action proposed by the agencies will no doubt be stymied by special interests welding the T&E Species Act.

Correspondence: I am not in favor of reintroduction of grisly bears into the Cascade Mountains. Why would you do that? They will be a danger to recreationists forever if you do that. Not even one human life is worth reintroducing them, nor even a serious mauling. Its like allowing people to own weapons of war/automatic machine guns. What a stupid idea. I can't be bothered to try and find it but is there is of the number of people will be killed and mauled by grislies when the have reached full population? That would be a sobering statistic. I did see one statistic where, I think in Yellowstone, the chance of being killed by a grisly is 1:2.7 million. But that includes every car bound visitor to that park. What is the chance for those who enter the wilderness backcountry; backpackers, hunters, birders, etc..... Those who want to see grislies in the wilderness can go there (to Yellowstone) with its sparse population. Don't put them so close to a major urban center with throngs of people seeking solice in the mountains of Washington. As the population continues to explode in this region we will need all open space we can save from development and industrial interests and it should not have man eating bears. We have done fine without Grislies for 100 years. Continue that success.

Correspondence: The reintroduction of a second Apex predator would be another blow to the Ag industry, not to say the everyday folks that like to play in the hill of the evergreen state, just watch the news and see what the other states are dealing with that already have the Grizzly bears, the wolves have already worked on the ungulate population's, so we add one more predator in there they will becoming down into our backyards, where our kids now are free to roam as they please, so what is the cost to bring them into our state, someone's child? the family pet, our maybe a family member? or a dear friend!!!!

But the biggest impact will be on the cattle producers. we are already having losses to wolves, cougars, So why one more?

Correspondence: I've reviewed the draft and given this matter a lot of thought. I wholeheartedly support bringing the grizzly bear back to the North Cascade region and I believe Alternative C will offer the best path forward for humans and grizzlies.

I've listened to arguments against this proposal. They primarily rely on fear of potential harm, to people or livestock. I understand, however, that grizzlies eat mostly plants and want nothing to do with us humans. I've hiked where grizzlies live in Alaska and Montana. In Alaska, I was lucky enough to see a grizzly while hiking. I'll never forget the experience. It was unadulterated awe. Something like seeing Mount Rainier for the first time on a clear day. Can you imagine our region without Tahoma? We are imaginatively impoverished without grizzlies here. By reintroducing them, we nurture our ecology of awe.

The paradox is that we'll be safer by accepting a small potential for risk because there is no question in my mind that we are in trouble without grizzlies in the region. They belong here. They were here until we shot, trapped, and poisoned them to extinction. I've studied ecology for many years in my job and understand well that every species has a role to play in the ecosystem. An ecosystem is like a body in which wholeness is essential. In other words, our North Cascades ecosystem has

been missing an organ for about 30 years. We have a chance to make our region healthy. Who will benefit from bringing grizzlies back? We humans will. Our children and our grandchildren will, in addition to all the beings of our region.

As they live their essential lives, grizzlies till the soil as get dig for rodents, disperse nutrients, and help huckleberries and other plants spread to new areas. As they come back to where they belong we humans will learn to live with them like all the other people who live alongside grizzlies in other areas.

Beyond this reasoning, I believe that we have a moral obligation to bring back a species we extirpated. Like my Native friends whom I've talked to about this issue, I view reintroduction as a kind of reparation.

Thank you for the chance to comment.

Correspondence: I recently learned about the Grizzly Bear restoration plan for the North Cascades. As someone who grew up in Central Washington and as someone who will return to live there next year in retirement, I'm thrilled at the prospect of grizzlies returning to Washington State. I've had the good fortune to see grizzlies in Alaska, Montana and Wyoming where their presence greatly enriches the hiking and backpacking experience. During the years I lived in Montana I was happy to see that people of most political stripes were thrilled to have grizzlies around. They knew it gave places like the Bob Marshall Wilderness a sense of the wild. Grizzlies are animals to treat with respect and caution, but that's no reason to not have them as a part of the ecosystem where they lived for thousands of years. I believe, with care and caution, conflicts with landowners nearby will be minimal. I wince when I see media sources depict bears as some sort of serial killers. They are not. The bears I've encountered have either ignored me or run away when I passed nearby. Please go forward with your recovery plan. I believe Alternative C would be my first choice.

Sincerely,

In Minnesota where we only have black bears

Correspondence: For the long-term success of grizzly restoration, natural recovery measures must also be included in both action alternatives thus reducing the need for wilderness degrading activities that are also ultimately bad for bears. This requires work with partners in British Columbia to ensure that grizzlies have corridors to move back and forth across the international border and to prevent a small North Cascades grizzly population from shrinking over time and becoming inbred.

An alternative that combines natural recovery with population augmentation under full ESA protections should also be analyzed.

The no action alternative has many good Bear Smart components on how people and communities can coexist with grizzly bears and these coexistence measures should also be included in both of the action alternatives. All possible measures must be taken to prepare residents and visitors for bears, particularly given the dramatic growth of the human population in the region and rapidly increasing recreation pressures in the Park.

Correspondence: I'm concerned about the advice to wear bear spray and carry a hand gun, combined with reminding people to wear bear bells, make noises, look around in heavy brush (what else is there in NC except in upper alpine meadows), etc. I have friends who already brings guns on hiking and skiing trips - this seems like an invitation for more and more such behavior , and a setup for many accidental shootings- someone pulls the trigger out of fear of a grizzly around every corner. Let's be honest with ourselves- who among us who has spent weeks in grizzly county hasn't had that constant fear and jitters? It's the lack of having a gun that kept me from foolishly shooting myself in the foot or, much worse, shooting a friend. A friend did have hikers pull a gun on his dog in bear country in the sierras - they told him "they thought it might be a grizzly." The population has soared here over past few decades. I'd like people to weigh the benefit for bear recovery against the cost of likely stressful and dangerous human behavioral changes in response to just the idea of grizzlies being here now in Washington.

Correspondence: Dear National Park Service,

I am writing to express my sincere concerns regarding the proposed reintroduction of grizzly bears into the North Cascades ecosystem. As an avid hiker and a mother, my experiences in the North Cascades have always been enriching and fulfilling. However, the prospect of encountering grizzly bears in these trails is deeply unsettling.

As a solo female hiker who often hikes with my young preschool-aged child, safety is my utmost priority. The presence of grizzly bears significantly raises the risk of potentially dangerous encounters, which could deter many hikers, especially those with children, from enjoying this pristine wilderness.

While I understand and appreciate the ecological importance of grizzly bears and the efforts to restore natural balance, I believe it is also crucial to consider the safety and concerns of the park's visitors. Many individuals, like myself, who have always considered the North Cascades a safe and peaceful retreat, will now be faced with the fear of these formidable predators.

I urge the National Park Service to consider alternative solutions that balance ecological restoration with the safety and well-being of park visitors. Perhaps more extensive studies could be conducted to find a compromise that ensures both the preservation of wildlife and the safety of hikers.

Thank you for considering my concerns. I hope a harmonious solution that respects both the natural world and the visitors who seek to enjoy it can be found.

Sincerely,

Correspondence: I am strongly against the grizzly bear restoration plan. Releasing grizzly bears in Washington state would be detrimental to every agricultural industry of the state. Grizzly bear are going to destroy our deer and elk herds that are already being destroyed by the wolves that were reintroduced. In my opinion we need to be stewards of our land and we won't be able to do that when the cattle rancher is run out of business because he can't deal with the wolves and bear killing his animals. Wildfires will get to be worse in the region because the cattle that used to graze and manage the forest will be run out of business. Grizzly bear are going to travel where the food is and the food as in deer and elk are of very few numbers across the whole state. So with that being said where are the grizzly's going to go? They are going to go into more populated areas to find food like horses sheep goats or anything you might have around your house. All in all I feel that releasing the grizzly bear is very dangerous and the whole idea of it needs to be abolished completely.

Correspondence: I do not support this proposition. The north Cascades have long been a world class recreation retreat. Already featuring diverse wildlife. By re-introducing grizzly bear there become a risk to the millions of people that visit each year.

Currently the north Cascades has both black bear and cougar as it's top predators. As we all know black bears are scary cats and not a big deal. Cougars are selective predators. As long as you take the right precautions they leave you alone. Grizzly bears on the other hand are monster killing machines.

Also seems like a waste of money.

Correspondence: You see: IT'S JUST YOU!!!

YOU want this.

YOU would get an absolute kick out of it - it would be YOUR sugar high!!!!

And - YOU would totally freak out if they then finally "procreate" - and small predators would maul and feast on their prey that they just killed!!!!

Some summer, when I went to Montana, I took a few salmon hatchlings with me from the Puget Sound to let them out in the lake bordering the home of the elderly couple whom I took care of.

That was absolutely sound - and not such a bizarre, weird idea as reintroducing predators in our precious Cascades.

The predatory Grizzlies are not needed there. They have no right to be there anymore.

----- Servheen has spent 54 years living in grizzly country. As a former bear biologist for the Fish & Wildlife Service, he has had a front-row seat to pitched battles over grizzly reintroduction.

-----Servheen: Look for long claws on the front feet. The size is pretty impressive compared to a black bear.

----- For recreationists, Servheen's advice is simple: The first thing to do when you hike in grizzly country is be aware - he said.

Awareness, to Servheen, means not wearing headphones, oblivious to the world, but rather staying in tune with your surroundings. He recommends asking yourself questions, like: Are you in a meadow with good visibility or are you on a brushy trail where you can't see around the next bend? Are you hiking near a noisy stream that might inhibit a wild animal from hearing you approach? Have you seen any bear tracks or scat on the ground?

----- McEwan: I carry bear spray like I carry a headlamp and first aid kit. It's just part of the outfit. I've always got it on the chest band of my pack, ready to rock and roll.

----- Matt Bowser's advice (director of Wild Montana Stewardship) is, "Carrying a handgun is a popular choice for bear defense among recreationists in Montana".

BUT - I HAVE NO HANDGUN.

AND IT IS NOT GRIZZLY COUNTRY ANYMORE - it's our precious little bit of refuge and recreation space!!!!!!

And when I am hiking, I don't want to constantly be aware and in anticipation of that there might be a grizzly around the next corner - or having to rely on bear spray (which is NOT 100 percent reliable!!!).

And I don't want to constantly clap my hands, or use bells - I just want to have my PEACE and quiet - absorbing the wonderful surroundings, the fresh clean air, the wildlife - and recharge my spirits, recover, and just enjoy the pristine ambience - TOTALLY without predatory bears!!!!!!

Re: Public Comment on Draft North Cascades Grizzly Bear Restoration Plan / Environmental Impact Statement

Dear National Park Service:

Washington Forest Protection Association (WFPA) is a forestry trade association representing large and small forest landowners and managers of more than four million acres of productive working forests, including timberland located in the coastal and inland regions of the state. Our members support rural and urban communities through the sustainable growth and harvest of timber and other forest products for U. S. and international markets. For more information about WFPA, please visit our website at www.wfpa.org.

WFPA appreciates the opportunity to comment on the U.S. Fish and Wildlife Service (FWS) proposal to establish a nonessential experimental population (NEP) of the grizzly bear within the U.S. portion of the NCE in the State of Washington under section 10(j) of the Endangered Species Act (ESA). WFPA is also submitting these comments on the National Park Service (NPS) Draft North Cascades Grizzly Bear Restoration Plan/Environmental Impact Statement ("Draft Grizzly Restoration Plan").

WFPA has several members who manage working forests adjacent to Management Zone 1 in the North Cascades Ecosystem (NCE) as well as Management Zone 2 in NE Washington and the South Cascades. We previously submitted written comments to the NPS dated October 21, 2019, on the Draft Grizzly Restoration Plan and ask the NPS and FWS to consider that comment letter as well as this letter. Previously, WFPA requested the NPS and FWS ensure that non-federal landowners receive assurances to minimize their legal risk from voluntarily supporting grizzly recovery efforts, either through a 10(j) rule or programmatic safe harbor agreement. WFPA appreciates the FWS and the NPS proposing an alternative consistent with that request. Therefore, if the FWS and NPS opt to proceed with an action alternative under the Draft Grizzly Restoration Plan, we strongly recommend the preferred Alternative C, which designates a NEP of grizzly bear in the NCE under Section 10(j) of the ESA.

While we recommend Alternative C, we believe there is opportunity to further clarify assurances for WFPA members and other nonfederal landowners conducting otherwise lawful activities consistent with the Washington State Forest Practices Act and Rules or pursuant to an approved Habitat Conservation Plan, Enhancement of Survival Permit, or similar federal authorization.

Specific recommended clarifications include:

- Any nonfederal lands within the proposed boundary of Management Zone 1 and Management Zone 2 should be explicitly identified as Management Zone 3, relying on a definition rather than the Figure 1 map.
- Forest managers, loggers, and others conducting otherwise lawful forest management activities, including persons engaged in supplemental feeding or depredation control of nuisance black bears in accordance with applicable state laws and rules should be included in the list of those authorized to conduct non-lethal deterrence activities.
- Permissible incidental take on nonfederal lands should include any habitat modification resulting from otherwise lawful forest management activities consistent with the Forest Practices Act and Rules and/or pursuant to an approved Habitat Conservation Plan, Enhancement of Survival Permit, or similar federal authorization.
- The nonlethal incidental take reporting requirements due to habitat modification resulting from otherwise lawful activities are impractical and should be exempted from reporting
- Finally, road use permits granted from U.S. Forest Service to nonfederal entities where the road in question is not located on National Forests should not need ESA Section 7(a)(2) consultation. At present the exemption appears to apply only to National Forest Lands.

Thank you for the opportunity to comment, should you have any questions I can be reached at [REDACTED].

Correspondence: Dear Park Service,

I am writing in support of the Alternative B plan to reintroduce grizzly bears to the North Cascades. I am an avid backpacker and hiker who has spent countless hours on the trails in North Cascades National Park. I also run a nonprofit, Reconnect Earth, that organizes summer backpacking trips for college-age students in the park and in Mount Baker-Snoqualmie National Forest. As someone who is very familiar with the North Cascades ecosystem and its value as a recreational, educational, and conservation resource, I believe it is time to bring the area's top predator back.

Restoring grizzly bears to the North Cascades will fill a gap in the food chain that has been left empty for decades. While the presence of these bears will mean park users need to take some additional precautions, we know that people and grizzlies can co-exist peacefully. I spent four years living in Montana, where I backpacked in grizzly country in places like Gallatin National Forest near Yellowstone. I know that it is possible to live with grizzlies by following common-sense practices, and that there is no reason this couldn't be done in the North Cascades.

Grizzlies have been virtually extinct in Washington State for too long, and it is time to return them to the North Cascades, which has a basically healthy wild ecosystem ready to support their needs. Please implement Alternative B and return the top native predator of this stunning mountain range to its rightful place in the food chain.

Thank you for considering these comments,

Correspondence: I am writing to express my support of Grizzly Bear restoration in the North Cascades Ecosystem. The grizzly bear has been an integral part of the ecosystem in the North Cascades for thousands of years prior to the predator eradication programs by humans in the 20th century. I have lived in Washington State for my entire life and in the the Methow Valley since 2017. Many of us choose to call this place home due to a love of big, wild places, places where the grizzly bear belongs. Due to decreased habitat and natural/human-made barriers (rivers, interstates, railway, etc.), there are few suitable places in the US (and even fewer in the lower 48) that provide a habitat where the grizzly can thrive. The NCE is one of these special places! As an avid backcountry traveler, I understand that humans are apprehensive about recreating in grizzly habitat. However, the wilderness is their home and a place that we are fortunate to be able to visit. Humans can easily adapt their behavior to maintain safe practices in grizzly country. We have many examples of these successes in Glacier National Park, the greater Yellowstone ecosystem, the Bob Marshall Wilderness, the Tetons, and of course Alaska!

There are a multitude of reasons to reintroduce the grizzly, including ecological benefits, creating greater genetic diversity in the threatened grizzly population and honoring the heritage and history of this region.

Please move forward with grizzly reintroduction!

Correspondence: Draft Grizzly Bear Restoration Plan / Environmental Impact Statement, North Cascades Ecosystem

Comments:

Historical information used for estimated past NCE grizzly bear (gb) populations is inaccurate and not representative of the westside, north cascades. Hudson Bay trading records would reflect a much larger area than the NCE. River travel was common for the era, the Columbia River and its tributaries go into British Columbia and Montana. Skins records would reflect a much larger area than the EIS uses. Cash or goods were paid only at the trading posts and sellers would travel very long distances to deliver skins. Past population estimates are too speculative for analysis in an EIS.

The historical westside NCE gb population was likely roaming bears from the eastern, more suitable habitat. Gb do not get much mention in local westside accounts. Personally, knowing one person treed by a gb in 1949 and knowing how far and often he ranged in the backcountry does not give me confidence that gb were a significant part of the westside NCE.

Food sources in the westside North Cascade mountains are not likely sufficient to support the desired grizzly bear population. The information on available food for westside North Cascades in the EIS is inadequate. The likely outcome of gb introductions will be the seeking of most plentiful food sources which means human food and garbage. Estimated carrying capacity for gb is not accurate enough for determining suitable recovery populations. Once bears associate humans with food, problems will occur.

Mortality of transplanted gb is underestimated. Capture and transport of gb will adversely impact existing populations through social losses. Mortality of transplants will mean more are needed to accomplish population goals. Disturbance estimated due to transport and drop off of transplants will be greater than the EIS states.

Acres of NCE available to support gb are inaccurate. The whole of the NCE is not useable/preferred habitat for gb. Land in the NCE is not equal. The EIS fails to break out the most suitable meadow, open forest conditions in acreage figures.

Environmental justice. This section is condescending and superficial, not suitable for an EIS. It fails to address issues that will impact rural communities near the NCE boundaries. It is dismissive of potential impacts.

Suggestions that gb may increase tourist visitation are not backed by fact. If Yellowstone NP is used as a basis for those statements, the EIS fails to note that most tourism in YNP is by car. In Alaska, Denali bus tours and viewing platforms above salmon runs provide the most opportunities for bear viewing. NCE is not comparable. The EIS fails to use appropriate figures in the analysis.

Human interactions with gb are not well analyzed in the EIS. Historically humans have hunted in groups and are the apex predators. Hunting interactions with humans change bear behavior as do interactions with armed humans. Transplants from nonhunted gb populations will see humans are prey or food sources. Most humans in the NCE are not armed and do not wish to carry firearms or even know how to use them. Human and gb interactions are not adequately analyzed in the EIS.

The EIS fails to document that humans have used what is being called "wilderness and untrammled" since time immemorial. This is either willful ignorance or condescending towards the first peoples.

If the ESA intent is to restore functional populations of listed species in their historical range perhaps California, which features a grizzly bear on its flag, would be more appropriate as a restoration area.

There are robust populations of gb in the greater Yellowstone ecosystem, Alaska and northern British Columbia. The case for successful population augmentation in the NCE is weak and speculative. The EIS fails to take an impartial hard look at the consequences of the proposed action and does not contain enough factual analysis to draw realistic conclusions.

Correspondence: I've been hiking and mountaineering in the Cascades for 15 years. I have enjoyed the feeling of safety knowing that I don't have to be on alert for grizzly bears. Some of the rationale is concerning to me. I don't understand what exactly is being gained here. For those that want to reintroduce the animal, if and when there is a death due to a grizzly encounter, are you willing to live with this on your conscious? Please do not do this so that we can recreate these beautiful areas safely.

Correspondence: I want to begin by saying that I fully support the reintroduction of grizzly bears to the North Cascades ecosystem. I think this is an important step in restoring historically degraded ecosystems at the hands of Americans and the US government. I would like to see the USFWS implement Alternative B with full ESA protections. The proposed timeline for recovery of 60-100 years is already far too long that allowing non-essential harassment and killing of reintroduced grizzly bears will have far too great of an impact on recovery. These are incredible animals that can thrive if humans put the effort in to minimize conflicts. A few things I would like to see to this end: 1) end cattle grazing leases in wilderness areas that are or could be impacted by reintroductions. It would be unreasonable to reintroduce grizzlies in areas with livestock and expect there not to be conflicts. There are plenty of opportunities for grazing outside of wilderness areas, but there are not plenty of opportunities for grizzlies to survive outside of those same areas. 2) Implement a livestock compensation plan for the case that a grizzly bear does kill livestock. We (the public) can afford to compensate ranchers that are impacted by reintroductions and make it clear that this is a group effort. This also reduces the incentive for grizzlies to be killed due to livestock conflicts. I'm excited for USFWS's plan to reintroduce grizzly bears to the North Cascades. I hope that you will take this opportunity to restore this incredible species and correct the historical wrongs that have been committed against it.

Correspondence: I oppose the reintroduction of grizzlies into the North Cascades. Since their removal, the population of Western and Central Washington has greatly increased, as has the popularity of the North Cascades and the surrounding recreation areas. With these increases in population and usage, the chances of human-grizzly or livestock-grizzly encounters also increases, potentially leading to fatal outcomes. The number of trails, forest roads, and their proximity to populated areas further increases the odds of such encounters. The ecosystem of the North Cascades is healthy and thriving, and reintroducing grizzlies serves no purpose other than to appease the desires of various environmental groups and activists. This plan has far too many risks to the surrounding population, with little to no benefit to the interests of the ecosystem that this plan claims to serve.

Correspondence: I support reintroduction of the grizzly bear in the North Cascades. I have hiked and camped in Yellowstone National park, Bear Tooth wilderness area of Montana and the N. Cascades with my husband and small children man times over the years and have never encountered a grizzly bear. It is not a problem to use precautions, such as carrying bear spray, packing food in bear tight containers, etc. Coexisting with wildlife in nature is essential to the whole experience. I believe the argument that the grizzly bear is a marker species and must be protected. Its extinction would dire.
Thank you.

Correspondence: Proposal C is the best way to improve the social tolerance towards the bears. Our ranchers, herders, and residents on the American West are comfortable with the lack of predator presence. It's safe for families, for livestock, and for tourism. No matter the financial influx from tourist visitation or the compensation provided for predated livestock. Proposal C gives the weary the feeling of more control over their environment because of the increased management tactics

available to managers. Those opposed to any reintroduction, let us see how the North Cascade ecosystem changes with the reunited carnivore. Traditional knowledge, today's science, and personal experience may help even the skeptical to understand the for ranging impacts of complete ecosystems.

Correspondence: I frequent the North Cascades both alone and with my family and this effort will significantly impact my decision to recreate in the area. I do not feel comfortable risking my families wellbeing taking them into areas where Grizzly bears are present. These bears do not have a fear of humans and will attack when surprised. Even though the risk is low, I cannot fathom willingly bringing my family into potential danger. We love to observe wildlife and my children love pointing out different animals on our hikes. There is already plenty of biodiversity in the region, adding an apex predator is not in the best interest of the people who visit the park. I strongly urge the committee to reconsider adding Grizzly bears to the North Cascades.

Correspondence: I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C: Restoration with Section 10(j) Designation. Alternative C is the best choice for bears and the people who live in and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you for taking the time to keep our North Cascades wild!

Correspondence: Grizzly Bears were in Washington and in the North Cascades long before white settlers came here. Those white settlers eradicated Grizzlies in the North Cascades, and now it is our job, as the current inhabitants of Washington -- native, immigrant, and settler descendants alike -- to restore these incredible creatures to their rightful habitat. Just as we must decolonize our impacts on the stunning ecosystems that Washington is home to, Grizzly Bears must be allowed to re-establish themselves in the North Cascades, where they once thrived before white settler intervention.

I am a hiker, and I recognize the risks associated with spending time in our great outdoors. It is not a playground. It is dangerous, it is wild, and it should remain wild. Bringing Grizzlies back supports that wilderness.

Correspondence: Since retirement I have lived in Cle Elum and Wilson, WY. The latter is 4 miles from Grand Teton National Park. Grizzlies are part of the ecosystem there. I hike and ski in WY, and have back packed in grizzly country. While aggressive bear encounters are terrifying to read about, they are actually extremely rare. I think these animals should be restored to their former habitat. If their numbers become too great, a small number could be hunted to manage the population as they are in GTNP. The large mammals are a tremendous draw for tourists (a mixed blessing) but might actually benefit the small towns dependent on tourism near the North Cascades National Park.

My scariest experience with a bear was in the North Cascades with a huge Black Bear who would not vacate the trail. Back country travelers need to practice better safe camping and travel due to the black bear population already. These same practices protect them from grizzlies as well. The bear safe lockers already in campgrounds make it easy to protect against bears. The problems are rarely the bears, but humans who won't use bear safe practices, and common sense.

I hope these magnificent mammals are restored, they have a right to exist in their native habitat. I would like my grandson to be able to know the mountains and wilderness as it was before it was over run by too many people. The North Cascades are a crown in this great state, The Grizzly bears would add another valuable gem to that crown.

Correspondence: To the National Park Service and U.S. Fish & Wildlife Service:

Thank you for the opportunity to comment on the North Cascades Ecosystem Grizzly Bear Restoration Plan and Environmental Impact Statement.

To preface our comments, we'd like to briefly highlight our orientation to the shared work of conserving and managing grizzlies. For the last fifteen years, People and Carnivores has worked in the field to reduce conflicts between large carnivores and people. We mostly work in Montana, but have had projects in Wyoming (primarily rangeland conflict prevention projects) and Idaho (assessing infrastructure on public lands to prevent conflicts with grizzlies). We are the only organization in Montana focusing solely on conflict prevention as a means of safeguarding people and property, supporting rural communities and livelihoods, and conserving large carnivores. We partner with agencies and landowners to design, implement, and maintain proactive, on-the-ground solutions that keep carnivores separated from people or attractants. We value our strong relationships with federal agencies, including the USFWS.

People and Carnivores' Support for Alternative B

From the proposed alternatives, we urge the Service to adopt alternative B--restoration with existing Endangered Species Act protections--as the most successful path for restoring grizzlies to the NCE.

We have seen that grizzlies will not recolonize the NCE on their own. Despite the sufficient grizzly bear habitat it provides, only one grizzly has been detected in the NCE in the past 10 years, making alternative A unviable for grizzly bear restoration in the NCE. Human intervention is required if grizzlies are to return to this historic habitat.

Designating NCE grizzlies as a nonessential experimental population under section 10(j) of the ESA, as done under alternative C, is not necessary and may undermine the success of this reintroduction program. Alternative C allows for

"greater management flexibility," yet most of the management actions under alternative C are already allowed under the full protections of the ESA as described in alternative B, because they will be determined to be needed lethal control actions. Those added under alternative C, like the allowance of incidental take, will delay the recovery of the species and can lead to situations where conflicts are more likely to occur as it may delay the need and reality for people to learn how to live with grizzlies. A similar situation occurs with the issuance of lethal control permits to livestock owners. This should remain with management specialists, as the rules around these permits are not effectively enforceable, create situations of increased risk (e.g., injured bears), and delay the implementation of conflict prevention methods. Most importantly, these additional management methods are unnecessary. Conflict prevention tools are an effective way to protect people, livestock, and crops from potential grizzly bears conflicts. If and when additional tools and actions are needed, they should be provided by trained professionals using protocol and regulation to guide their actions.

Alternative B allows grizzlies to be reintroduced to the NCE while allowing agencies to manage the species in ways that will protect people and their property. One of the primary reasons bears are removed from areas is due to conflict. Alternative B not only allows for the relocation of bears, but allows for the lethal removal of individual grizzlies in response to conflict, as well as in defense of life. To proactively avoid conflicts, this alternative calls for increased education about living with grizzlies.

Environmental Impacts Under Alternative B

In examining environmental impacts, alternative B offers the most balanced consequences of the alternatives.

For grizzly bears, alternative B allows for the restoration of the species to historic and presently suitable habitat that would not occur under alternative A. It's suggested that increased management options under alternative C will best address human-bear conflict, stating "without management tools to sufficiently address conflicts between grizzly bears and humans, the escalation of conflict situations is likely to erode social tolerance for grizzly bear restoration among some groups." Primary management tools should be those focused on conflict prevention, including tools that we have seen increase social tolerance of grizzlies by preventing conflicts like electric fence, scare devices, livestock guardian dogs, use of range riders, and carcass management--all of which can be used under any alternative. Lethal control is also allowed under alternative B and ensures trained professionals are responsible in situations where this management method is required.

For other wildlife and fish, reintroduction of grizzly bears under alternative B will "contribute to restoring missing ecological interactions." These positive benefits are not gained under alternative A, and no additional benefits are gained under alternative C.

For wilderness character, restoring grizzlies via alternative B, as opposed to alternative A, would "benefit the natural value of wilderness," with "adverse impacts...offset by restoring a native species." Alternative C would have greater adverse impacts to wilderness character due to "human intervention and manipulation" of this species.

For visitor use and recreational experience, the reintroduction of grizzlies can increase visitation as individuals want to see these animals. Concerning the potential increase of conflicts between bears and visitors, alternative B offers management solutions, including lethal take in necessary situations. Additional take offered under alternative C can provide visitors with the false impression that bear behavior is not influenced by human actions and encourage poor safety practices, and that any bear near a human is cause for removal creating an inaccurate sense of how bears should and can be managed.

For public and employee safety, education on preventing conflicts, as will be increased under alternative B, promotes conflict prevention over conflict response, creating less of a need for the increase in relocation management as described in alternative C.

For socioeconomics, restoring grizzlies as described under alternative B presents the fewest negative impacts to socioeconomic dynamics, as it does allow for management response in cases of livestock depredation. Removing the requirement for federal agencies to consult under section 7(a)(2) of the ESA for livestock grazing, as alternative C would, can create situations where livestock operations continue as if nothing has changed on the landscape and lead to more grizzly-livestock conflict that will require the removal of bears, slowing the restoration effort.

For ethnographic resources, continued communication with Tribes will be essential in determining how each alternative may impact these resources.

Proactive Conflict Prevention is Key to the Program's Success

Throughout these comments we have mentioned the importance of conflict prevention. Although People and Carnivores works toward lethal control being a last resort after proactive solutions are exhausted, we understand that the removal of some animals is a necessary tool for grizzly bear management. That said, we know from our extensive experience working with communities and private landowners that prevention is effective most of the time. Notably, on nearly all of our hundreds of projects, once we apply preventative tools, we see no losses for humans, property, or bears. These tools include electric fencing, livestock guardian dogs, range riders, and scare devices, and they should be prominent in the management toolbox used by the NPS and USFWS.

Proactive conflict prevention can address concerns about property loss, human safety, and grizzly bear movement brought forward by Washington residents at recent public comment sessions hosted by the NPS and USFWS. We've experienced producers and rural community members asking for alternatives to lethal control when they hear from their peers or observe how well prevention tools can work. We have been contacted by several ranchers seeking out prevention tools, having experienced the inadequacy of reactive management. There will always be some conflicts and encounters we can't avert, but widespread conflict prevention work will make living with grizzlies safer, easier, and less contentious.

Please let us know if you have any questions about our comments or our conflict prevention work. Thank you again for the opportunity to share our input.

On behalf of People and Carnivores, and sincerely,

Correspondence: I support Alternative A, the No Action Alternative.

I am a member of both the Pacific Crest Trail Assn and the Back Country Horsemen of Washington and I recreate and volunteer on trail maintenance in the proposed Grizzly Bear Recovery Areas.

The long-term impact of mechanically importing bears to Washington on recreation, hunting, farming, ranching, and tourism needs more research and planning. All are huge economic necessities for Washington state. The proposed North Cascades Grizzly Bear Recovery Area, from Cle Elum to Canada, is a huge area and very popular for hiking, horseback riding, camping, and bicycling. Not to mention the ranchers and farmers who live there. The concern over human-bear interactions by the well-heeled bear conservationists will likely result in large recreation area closures, just for a few bears. With already limited and over-used trail opportunities in WA (people parking for miles from a trailhead just to access it), this will result in

even more overcrowding and resource damage by those who recreate on our public lands. It also puts the future of the long-planned and worked-on Pacific National Scenic Trail in danger of being completed.

If the bears come to Washington by themselves from Canada, proving that the natural resources in the area can sustain them, then we deal with that then. We need more information on that plan, which is not addressed in the DEIS.

My guess is that the majority of citizens who support this idea will never have their personal lives or livelihoods affected at all by the decision, which to me, is a sad way to make significant changes for those who will.

Thank you for considering my opinion,

Correspondence: I'd like to voice my opposition to introducing grizzlies to the North Cascades as a resident of a town that borders the park and a frequent user of the park and surrounding region. Among many concerns, the primary ones I'd like to highlight is the risk of introducing a non-native population of apex predator bears into an already struggling ecosystem. The primary food source for these bears would likely include salmon and other fish whose populations have been in steady decline over the past several years. Not only would this be harmful to the efforts to conserve these native river fish, but also bringing in non-native grizzlies from an outside area would create competition for our established native black bears. In addition to salmon and other fish, our native population of deer and elk have also been suffering herd number decline and again, introducing a non-native apex predator to the region would only further disrupt the efforts in conservation of these animals.

There is no way to guarantee that these non-native bears would stay within any boundaries established by the people who have decided this was a good idea. There is no way to guarantee the families in the region who farm and raise livestock would be able to safely maintain their livelihoods safe from a non-native predatory species. I believe that in bringing these bears to this region, not only would it potentially put the bears at risk due to farmers and residents needing to keep their homes and farms safe, introducing competition with the native animals from the region, risking the bears simply migrating back to the area they are from and familiar with, but also increase public distrust and dissatisfaction with the National Park Service and Federal Government.

It is not fair, as residents of this region, and therefore the people to be most directly effected by decisions made in Seattle, to be overlooked and disregarded in interest of serving other's peoples ideals.

Correspondence: I will start by saying that I would like to see grizzly bears reintroduced to the North Cascades Ecosystem. However, if they are introduced, I would want all organizations involved to leave no stone unturned to ensure they have the best chance possible to survive as individuals and establish a viable population.

Analysis of NCE Draft EIS using HDST

In my assessment of the North Cascades Ecosystem Grizzly Bear Draft Environmental Impact Statement, I will apply the Hierarchical Decision-making System for Translocations (HDST) as outlined by Pérez et al. in their 2012 paper, "What is wrong with current translocations? A review and a decision-making proposal" (full citation below). Using the HDST process is a way of systematically looking at all aspects of a proposed translocation project to assess its viability and reduce subjectivity in the final decision-making process. The HDST method as proposed by Pérez et al. 2012 (Table 1) outlines 10 main criteria divided into three decision levels that must be applied using a step-by-step methodology. For example, if the criteria in level 1 are not fully met the project should not continue even if all the criteria for levels 2 and 3 are met.

I will now apply the HDST methodology to evaluate the North Cascades Ecosystem Draft Grizzly Bear Restoration Plan and Environmental Impact Statement (NCE DEIS).

Level 1: Necessity of the Translocation

1. Is the species population under threat?

Yes. Grizzly bears are proven to be threatened in the NCE. They were listed as threatened under the Endangered Species Act in 1975 and the last confirmed sighting of a Grizzly bear in the NCE was in 1996. They are now considered to be functionally extirpated from the NCE.

2. Have the Threatening factors been removed or controlled, or will they be absent in the release area?

Partial. Human conflict was the most significant historical threat to the grizzly bear population in the NCE. If the bears are protected under the Endangered Species Act or as a nonessential experimental population the threat of direct human conflict would mostly be removed. However, now with a larger population of people living near, traveling through, and recreating in

the NCE than when grizzly bears last inhabited it, indirect human conflict is still likely to occur. This threat would be slightly increased if alternative C is adopted because it would give more flexibility for the removal of bears that conflict with or become habituated to humans. Another consideration is the presence of sufficient suitable habitat and food sources with consideration to season-to-season variability. The DEIS cited a few sources that have studied the carrying capacity of the NCE for grizzly bears over long periods of time and concluded the NCE could support the 200-bear goal of the DEIS (Servheen et al., 1991; Lyons et al., 2018). The DEIS also cites a study (Ransom et al., 2023) that projects the habitat suitability for grizzly bears in the NCE will improve over time when climate change is accounted for. However, what these three studies and the DEIS fail to address is the short-term or seasonal fluctuations in suitable habitat and food sources that could prevent a stable grizzly bear population from establishing.

3. Are translocations the best tool to mitigate conservation conflicts?

Yes. The closest existing populations of grizzly bears are located to the east in the Selkirk and Kettle Granby Mountains, but in numbers too small to expand their range, and to the north in British Columbia, again in low numbers. Even if neighboring populations were large enough to facilitate range expansion, they would face many barriers to dispersal including the Fraser River, and high levels of human influence including roads, railroads, and cities. Therefore, it is highly unlikely that a population would establish itself in the NCE without translocations.

Level 2: Risk Management

4. Are the risks tolerable for the target species?

Unknown. With the information presented in the DEIS, the risk for the translocated grizzly bears is too high. There needs to be more consideration of the yearly variability of habitat suitability and food sources. Long-term trends are important to study and understand but if the initial translocated population faces short-term threats such as a bad wildfire season, or a heavy snow year with a short growing season resulting in food shortages, it could result in a mortality rate the introduced population cannot recover from. The DEIS cites an abundance of potential food sources for grizzly bears but does not identify the presence of a high-density food source in critical seasons such as late summer and early fall. Grizzly bear populations in other areas area rely on at least one such food source. Short-term threats also tend to cause bears to venture closer to human settlements in search of easy food sources. This can cause bears to become habituated and increase the conflict between bears and people. Habituated bears have a higher mortality rate than wary bears, and rarely will go back to being a wary bear even after short-term threats are removed (Pease and Mattson, 1999).

5. Are the Risks for other species or the ecosystem acceptable?

Yes. The DEIS outlines the potential impacts on other wildlife species including ungulates, fish, birds, small mammals, and other predatory species. Other animal populations would likely either not be affected by the introduction of grizzly bears, or the impact would not be harmful at the population level. The introduction of high trophic level animals like the grizzly bear could have a positive effect on the ecosystem by restoring ecological interactions.

6. Are the possible effects of the translocation acceptable to local people?

Yes. Some people will be excited about the reintroduction of grizzly bears in the NCE, and it may draw some visitors to the region, benefiting locals economically. However, there will inevitably be a subset of people who are opposed to reintroduction due to the potential loss of livestock and an increased perceived danger while recreating in the NCE.

Level 3: Technical and logistical suitability

7. Does the project maximize the likelihood of establishing a viable population?

No. Insufficient population modeling has been completed. In the NCE grizzly bear DEIS a simplistic exponential population growth projection is used that is likely not representative of actual grizzly bear population growth rates. It also

underestimates the risk of failure of translocation and extinction. A better method would be to perform a comprehensive population viability analysis as recommended by Traill et al., 2007, to determine the minimum viable population size and to identify the most important variables to control to give the highest chance of success.

8. Does the project include clear goals and monitoring?

Yes. The project has clearly defined goals: to establish a population of 200 bears within 60 to 100 years, increase biological diversity in the NCE, and enhance the long-term probability of survival for individual grizzly bears in the NCE and of the grizzly bear species by establishing multiple populations. The monitoring of the bears has also been outlined sufficiently. GPS tracking collars would be installed on each bear before being released to track their movements and send out mortality signals if needed and remote wildlife cameras would monitor bear presence and reproductive success and take genetic samples by installing hair snags.

9. Do enough economic and human resources exist?

No (unclear). In Appendix C of the DEIS, the implementation costs are outlined but it is unclear where the funds would come from and if the funding has been secured. Appendix C also fails to cover cost variability throughout the years after initial implementation. This project has three main phases with different costs associated with each phase. The first phase includes the translocation and close monitoring of the bears, the second phase includes monitoring the population and handling any conflicts or supplementing the population with additional translocations if needed, and the third phase is the final stage of the project with minimal monitoring once the population is established. I would want to see how these costs are anticipated to change over time and make sure funding has been secured throughout the whole 60-100-year timeline of the project. With the long-term scope of this project, it is also important to secure staff or outline a plan to train new staff to ensure the project has the human resources needed to make it successful years into its implementation. I did not see any mention of this in the DEIS. Appendix C also does not outline resources for adaptive management techniques that might be required such as trail or road closures, addressing conflicts with livestock, or resource restoration to ensure adequate food supply.

10. Do scientific, government, and stakeholder groups support the translocation?

Yes. The DEIS had many contributors including the United States Department of the Interior, the United States Forest Service, the Washington Department of Fish and Wildlife, the National Park Service, the US Fish and Wildlife Service, and the Washington State Historic Preservation Office. There has already been one round of public comments before the DEIS was released with the second public comment process open now. The NPS and the FWS have met with Tribes, however, the DEIS does not explicitly say whether the Tribes are in support of the translocation effort and reintroduction of grizzly bears to the NCE, nor does it mention if they approve of the methods. I would want to see more information included in the DEIS explicitly addressing the Tribes' interests and wishes to ensure their voices are heard.

Conclusion:

After a systematic review of the North Cascades Ecosystem Draft Grizzly Bear Restoration Plan and Environmental Impact Statement using the Hierarchical Decision-making System for Translocations (HDST) as outlined by Pérez et al. in their 2012 paper, I would suggest further considerations before proceeding with action alternatives B or C. Specifically, additional considerations must be given to ensuring abundant food sources during key times of the year accounting for season-to-season variability, performing a detailed population viability analysis, and further outlining the funding sources and details for all stages of the project. The risks of implementing action alternatives B or C without including additional considerations in the DEIS are too high and could jeopardize any future efforts to reestablish grizzly bears to the NCE.

Thank you for your consideration.

Correspondence: I think this is a terrible idea given the amount of hikers and even people that specifically travel to these areas in Washington for outdoor activity. Once you introduce them, if the number of attacks goes up, what is the plan? Take them back out again after enough people have died? Shoot them? It seems like a terrible set up. I could also see this impacting travel to Washington and commerce if people stop wanting to come enjoy our outdoors here.

Correspondence: One of the great advantages of living in the PNW is the easy access to nature. That said, potentially increasing encounters with grizzly bears shouldn't be encouraged or facilitated. The attached document states "The restoration of grizzly bears to the NCE could increase visitation and recreational use of the NCE as visitors seek to experience grizzly bears in their native habitat." This is irresponsible. We should not encourage visitors to seek out grizzly bears. They currently exist in remote areas where few hikers go, and it should stay this way. The bears should have space to themselves without human interactions, and it is safest for humans to stay away from them as well.

Correspondence: Grizzly bears should be reintroduced to the Cascade Mountains. They are an essential part of the ecosystem. The reason they need to be reintroduced in the first place is because of human influence. Bear management infrastructure is already in place in some locations in the Cascades, like bear-resistant trash cans and trail monitoring. The National Parks Service already has articles informing hikers and campers of proper bear etiquette and safety measures. Grizzly bears have a right to the land as they have been here longer than humans. They are culturally significant to the Pacific Northwest and their population is dwindling. The reintroduction of the bears to the Cascades could greatly benefit the species and increase their numbers.

Correspondence: RE: 2022 North Cascades Ecosystem Grizzly Bear Restoration Plan comments by the Washington Outfitters and Guides Association

The planned re-introduction of the Grizzly Bear to the North Cascades of Washington State is a misguided attempt to establish a predatory bear population into a geographical area not suitable for these animals.

The draft EIS states the North Cascades ecosystem of north-central Washington State has been targeted as one of six recovery zones where it is identified as an area grizzly bears inhabited across a continuous range of Western North America. Contained in this environmental impact statement there is an acknowledgement of little substantial proof that this area supported grizzly bears. It is also evident that there is a substantial effort to "synthesize" the data to justify the reintroduction decision.

Historical harvest records show the number of grizzly bears harvested. The location of the harvest was not recorded. It is suggested there is a wide geographical area involved in the harvests and that the recorded numbers may or may not have been harvested from the target area. "The current low number of grizzly bears along with an apparent scarcity of historical observations obfuscates the extent to which the North Cascades and its surrounding lowlands previously supported grizzly bears". Of interest, the historical harvest records of the black bear significantly outnumber the grizzly bear harvest records, yet the black bear are constantly sited in Washington State - the question is why are these black bears still visible in Washington State and not the grizzly? This directly points to the fact that the proposed reintroduction area does not have the proper habitat in the amount needed to support a viable grizzly bear population.

The proximity of the target area to areas of concentrated population in Washington State is problematic. The historical data in the EIS does not address the changes/growth of the population of Washington State. The State of Washington is the 13th most populated state in the continental US - growing in population from 523,000 in 1900 to 7,740,745 in 2022. The State has seen growth in each year from 1900 to 2022 (apart from 1947). There is nothing to suggest this growth will not continue to occur, making the State more incompatible with a grizzly bear population. The comparing areas where grizzly bears are known to inhabit:

State Population Geographical Square Miles

Washington 7,740,745 71,362

Montana 1,122,867 147,040

Wyoming 581,681 97,814

The population and geographic size of Washington State should be a determining factor against the re-introduction.

Recreational activities (including horseback riding, hunting, backpacking/hiking) in Washington State are embraced and outdoor enthusiasts expect safe access to the national forests. The introduction of grizzly bears will create an elevated likelihood of dangerous to fatal human/bear interactions.

Concern for the well-being of the grizzly bear should be paramount in the final decision to re-introduce but it should not outweigh public safety nor ignore the negative impacts that reintroduction will produce. The grizzly bear is on the endangered list due to its low numbers - one would argue that to sacrifice even one grizzly in the relocation process is counterproductive to the end goal of increasing grizzly numbers.

It is the position of the Washington Outfitters and Guides Association that Alternative A: No Action be taken and then continued discussion of grizzly bear reintroduction by the National Park Service and the US Fish and Wildlife Service in the North Cascades of Washington State needs to stop once and for all.

Correspondence: Thank you for this opportunity to comment on the: Draft Grizzly Bear Restoration Plan / Environmental Impact Statement for the North Cascades Ecosystem

As a member of Back Country Horsemen of Washington, I am very concerned with the ability to continue to recreate in the North Cascades should a small population of heavily protected grizzly bears be mechanically moved into the region that we recreate in. The DEIS does not sufficiently analyze the impact to recreation or present any options for how trails can be maintained open in the presence of protections implemented to reduce human-grizzly interactions.

1. The Pacific Crest National Scenic Trail runs through the core habitat and has permitted distance hikers of around 10,000. When considering the other trail users in and along the North Cascades Ecosystem (NCE) since this is one of the most populated areas around any bear ecosystem, the use likely exceeds a quarter million visits. However, the DEIS indicates that

the use is insignificant. It is very significant and will likely result in many human-bear interactions.

2. The Pacific Northwest National Scenic Trail also runs through the NCE as well as other bear ecosystems to the east, including the Cabinet-Yaak (CYE). The CYE has a more established population of bears but still has resulted with challenges to the very existence of the trail due to the limited number of bears in the CYE (20-40). Opposition to the National Scenic Trail in the recovering bear population area as well as the connecting landscapes between ecosystems has also been expressed by USFWS staff, the same agency putting forth the NCE proposal through which the same trail will pass.

3. Without a more detailed analysis of how to retain the carrying capacity of the trails, trailheads, and campgrounds without resulting in long term or permanent closures, there is no way to effectively review this DEIS.

4. Furthermore, the NPS and USFWS have pointed out that the Canadian counterparts and First Nations are preparing to release grizzly bears in the northern part of the NCE. IF that was the only release point, it would move the core recovery/release area north and away from the more densely human populated areas of Washington State. It also would be in line with Washington State law as well since no bears would be translocated directly into Washington, and there also would be predictability on how many bears are being moved into the entire NCE which overlaps both countries. The BC government has noted that their Recovery Plan is being developed jointly with the USFWS even though this US EIS only addresses the Washington effort.

5. As a trail horse rider in the NCE, I ask that the No Action Alternative be selected. The areas we ride in includes the Mt Baker Snoqualmie National Forest, the Okanogan Wenatchee National Forest including the Pasayten Wilderness, and the North Cascades National Park. We have many horse camps along the boundary of the NCE. We cannot support either Action Alternative without more substantive analysis on impacts to recreation as well as knowing more on the joint planning with Canadian counterparts.

Correspondence: Dear National Park Service, et al:

I am in favor of restoring our Grizzly Bears to our North Cascades Mountain Range where they were exterminated years ago.

The basis of my comments is the fact that man has degraded our ecosystems here in our National Parks and Forests because of human encroachment, agribusiness, and runaway land development. This is why the Grizzly bears were exterminated all those years ago. Man did not find a happy medium living in harmony with these apex predators that, in my opinion, God created and placed where He wanted them and for His purposes. Man cannot manage nature because he is merely a part of nature. Management means having control over God and Nature...it doesn't work! IF you restore Grizzly bears to the North Cascade Mtn Range, they will need protection from man. Figure that out first! Don't harm the bears once they are restored to their rightful and meaningful ecosystem.

They, like the Gray Wolves were/are hammered because they live in habitats man has encroached upon, our Public Lands that we pay taxes on to keep these places wild and for nature. Man has to comply with nature, not nature with man. It seems that when you try to sort something out from the rest of something, we find it hitched to everything else, (John Muir). We are all connected...every living species on this planet!

These species, these Grizzly Bears need to come back and restore the balance of nature man has ripped away from our ecosystems in our North Cascade Mtn Range. They need to be here! They don't need to be shot for any depredation of cattle either. That is the price cattle ranchers pay to do their money-making meat business. Cows don't belong in or on our Public Lands!! They are non-native and have no business being on those lands or nearby them for the sake of our wildlife. We've encroached enough!

Please bring our Grizzly Bears back to our North Cascades Mountain Range where they once lived and thrived. Restore the balance of nature that Grizzly Bears bring to our planet...they do matter!

PS: By the way, I hope our Native Tule Elk at Point Reyes National Park/Refuge are getting the space they need to live unharmed by man and his agribusiness there! Those fences need to be come down to restore their rightful place on those Public Lands!

Best Regards,

National Park Service
North Cascades National Park Complex
810 State Route 20
Sedro-Woolley, WA 98284

Subject: Formal Comment on the North Cascades Ecosystem Grizzly Bear Restoration Plan/Environmental Impact Statement

Dear National Park Service,

I am writing to formally endorse and express my comprehensive support for the Grizzly Bear Restoration Plan in the North Cascades National Park Complex. As a former National Park Ranger stationed at the Stehekin district of NOCA, I have a deep connection to the region and believe that the restoration of grizzly bears is a crucial step towards preserving the ecological integrity of this magnificent landscape.

Personal Reflection: During my tenure as a ranger at Stehekin, I marveled at the diverse wildlife that called NOCA home. While black bears were a common sight, the absence of grizzly bears, a once-native species, left a noticeable void in the ecosystem. The restoration of grizzly bears not only reinstates a missing element but also contributes to the overall health and resilience of the North Cascades.

Legal Framework and Compliance: I firmly believe in the importance of accurate and extensive bear counts for evaluating the success of the restoration plan. The National Park Service should invest in monitoring programs employing advanced scientific methodologies to provide precise population data, adhering to the legal framework established by acts such as the National Park Service Organic Act and the Wilderness Act.

Ecological and Biodiversity Benefits of Grizzly Bear Restoration: The restoration of grizzly bears to the North Cascades holds significant ecological importance. As apex predators, grizzly bears shape ecosystem dynamics through their foraging behaviors, predation patterns, and role in seed dispersal. This initiative aligns seamlessly with the principles enshrined in the National Park Service Organic Act, the Antiquities Act, the Endangered Species Act, the Wilderness Act, the Washington Park Wilderness Act, and the North Cascades Enabling Act of 1968.

Public Safety and Livestock: Scientific studies, including "Fatal Grizzly Bear Attacks in the Greater Yellowstone Ecosystem" and "Grizzly Bear Predation on Humans in North America," suggest that well-managed bear populations and responsible human behavior can coexist harmoniously. The data presented in these studies provides valuable insights into minimizing potential conflicts between grizzly bears and human activities.

Public Access: Studies such as "The Impact of Grizzly Bear Restoration on Public Access in the North Cascades Ecosystem" and "Grizzly Bear Restoration in the Selkirk Mountains: A Risk Assessment" indicate that restoring grizzly bears to the region would have a minimal impact on public access. Well-managed coexistence strategies,

public education, and responsible recreational practices can ensure the enjoyment of the North Cascades by both humans and bears.

Prohibitions on Detrimental Activities: To safeguard the recovery process, I urge the National Park Service and the U.S. Forest Service to enforce strict prohibitions on activities detrimental to bear recovery, such as road building, mining, deforestation, construction, and hunting. The identified human activities, as per the U.S. Fish & Wildlife Service, pose significant threats to grizzly bear habitat, and strict enforcement is necessary to ensure the success of the restoration plan.

In conclusion, I commend the National Park Service for its commitment to conserving and preserving our national parks. Restoring grizzly bears in the North Cascades is a vital step toward ensuring this unique ecosystem's long-term health and sustainability. I urge the NPS to expedite bear recovery, considering this restoration initiative's urgency.

Thank you for your time and consideration.

Sincerely,

Covington, WA

RE: Public Comments on the September 28, 2023 Draft Grizzly Bear Restoration Plan/ Environmental Impact Statement for the North Cascades Ecosystem

Dear Superintendent Striker,

Thank you for the opportunity to submit these comments on the U.S. Department of the Interior, National Park Service ("NPS") and U.S. Fish and Wildlife Service ("FWS") North Cascades Ecosystem Draft Grizzly Bear Restoration Plan / Environmental Impact Statement (hereinafter "Draft Plan"). These comments are submitted by the Western Environmental Law Center on behalf of WildEarth Guardians and Nimiipuu Protecting the Environment. WildEarth Guardians is a non-profit conservation organization dedicated to protecting and restoring the wildlife, wild places, wild rivers, and health of the American West, with a long history of engaging on grizzly bear issues (including repeatedly in the on-again-off-again plans to restore a population to the North Cascades Ecosystem). Nimiipuu Protecting the Environment works to carry on the time-honored sustainable environmental practices in the tradition of the Nimiipuu by facilitating and organizing tribal youth and adults in activities for the protection, enhancement, and promotion of mother earth and the Nimiipuu culture.

We submit the following comments on the 2023 Draft Plan, generally in support of Alternative B - reintroduction of grizzly bears into the North Cascades (without a 10(j) rule designating the NCE population as an "experimental" population), with the protections the Endangered Species Act provides grizzly bears elsewhere in the U.S. However, in these comments, we also identify several concerns around the use of the best available science, including the identified carrying capacity, inappropriate and arbitrary boundaries for grizzly bear dispersal, an overly slow translocation timeline and small number (25) for the initial phase. We also attach (attachments A and B) and incorporate wholly, the comments submitted previously on behalf of WildEarth Guardians. We separately submit comments (via the federal rulemaking portal) in opposition to the proposed 10(j) rule and designation of the North Cascades Ecosystem population of grizzly bears as experimental, non-essential.

Listed as "threatened" in 1975, grizzly bears were among the first species granted federal protections under the Endangered Species Act (ESA) shortly after the Act became law (now 50 years ago). Roughly 50,000 grizzly bears once inhabited the western contiguous United States. However, European settlement resulted in increasing human/bear conflicts, with the grizzly bear on the losing end of that conflict, not least as a result of government-funded eradication programs. By the 1930's, grizzly bears in the lower 48 states numbered fewer than 500. At this time, the "range and number of grizzly bears were reduced to less than 2 percent of their former range and numbers." And by the time grizzly bears were listed, the population estimate was 136-312 bears.

Although grizzly bears are making a comeback to the lower 48, today, after nearly 50 years of protections and efforts to restore healthy populations, they still number fewer than 2,000 in 3 states. Grizzly bears exist in only a few small isolated populations in the lower 48 and they are still absent the vast majority of their native habitat- including the North Cascades Ecosystem (NCE), which as one of the most intact wildlands in the contiguous United States, provides outstanding habitat for grizzly bears. The U.S. side of the North Cascades Ecosystem is one of the largest contiguous blocks of public lands in the lower 48, encompassing nearly 9,600 square miles, about 40% of which is in protected status as Wilderness or National Park. The U.S. portion of the NCE, particularly when combined with the Canadian portion of the NCE (4,000 square miles), offers an exciting and important opportunity to support long-term survival and recovery of the grizzly bear

Restoring grizzly bears to this large, wild, and remote area, where much of the prime grizzly habitat is protected, is key to recovering grizzly bears as a whole, with interconnected populations that exhibit resiliency, redundancy, and representation. We are eager to see and support the restoration of this population. However, we have some concerns about the reintroduction plan and also support Alternative B rather than the Park Service's and Fish and Wildlife Service's preferred alternative - Alternative C.

Recovery efforts should include all current suitable habitat, including areas south of I-90. And these efforts should be fluid enough to provide protections for grizzly bears in any areas they successfully colonize. This would hopefully alleviate dealing with problems like the essentially arbitrary lines that have hampered recovery efforts in the NCDE and GYE and the spatially truncated protections in the Bitterroot Ecosystem. Given the wide range of estimated carrying capacity (300-800+ from various studies) and the highly imperiled status of grizzly bears in adjacent British Columbia which create uncertainty about what will be needed, using all suitable habitat is of greater imperative. And the uncertain effects of climate change only exacerbate the need to establish grizzly bears in as much currently suitable habitat as possible. Although some suggest all will be well even in the face of a changing climate, others project a decline in huckleberries and the bumble bees that pollinate the berries. All of this uncertainty lends further support for protecting bears and all suitable habitat and translocating grizzly bears into all suitable habitat, both north and south of I-90. We encourage you to remove Management Zone 2 status as is

currently proposed, for bears in suitable habitat south of I-90.

The DEIS proposes a plan for translocating 3 to 7 bears/year for 5 to 10 years, seeking a population of 25 bears for the initial phase with a shift at that point to an “adaptive management” phase during which additional translocations would be purely voluntary. Under this adaptive management, in the best case scenario, this might mean a sustainable population in 100 years. The best available science would support a faster pace, with 200 bears in 25 years. The history of augmentation in the Cabinet Mountain population suggests that only 2 of 25 introduced bears successfully reproduce (as per the Cabinet-Yaak annual progress reports), which raises concerns for the translocation plan - with only 3 to 7 bears to be translocated per year, and a shift to a different phase when the population is just 25 bears. Recent studies suggests that when grizzly bear populations are isolated, there appears to be a tipping point of around 50 individuals, below which adult female mortality, even with intensive management, becomes prohibitive for population recovery. The best available science supports the translocation of a substantial number of bears each year (e.g., 20) into targeted areas, with sustained translocations until at least 50 reproductive-aged bears have been documented, ideally more. A vigorous and sustained reintroduction effort will likely be needed given the likely adverse effects of competition for shared foods from high densities of resident black bears, which have a competitive advantage when exploiting low to medium densities of berries and herbaceous food.

Coexistence efforts will be essential and should be well-established and institutionalized in a large area encompassing targeted reintroduction areas prior to reintroduction. The Blackfoot Challenge provides a good model for how to address potential conflict with livestock. While grizzly bear reintroduction in the NCE has broad and overwhelming support from the public, substantial education and support for conflict prevention and coexistence (which must include a broad set of tools, and not rely primarily on the removal of grizzly bears) must be provided early and maintained.

Grizzly bears in the NCE will need meaningful habitat and individual-level protections (e.g., restrictions on open road access to be $<0.6\text{km/km}^2$) in areas otherwise judged to be suitable habitat along with assurance of good connectivity between wilderness areas and areas subject to this kind of road management. The ESA provides for meaningful habitat protections, including through its Section 7 consultation provisions. But a 10(j) designation would create loopholes that allow the Forest Service to take actions on National Forest Lands that may affect grizzly bears, without Section 7 consultation. Although much is made of the flexibility that a 10(j) rule and designation could provide, the current “Interagency Grizzly Bear Committee Guidelines” as well as the Fish and Wildlife Service Hazing Guidance provide plenty of flexibility in dealing with conflict, and even “preventative action.” This is more than clear when viewing the actions taken in Montana in response to conflict or even potential conflict, where bears have been relocated or removed as a result of concerns that a conflict could arise (we do not condone this, but simply note that existing framework pursuant to the threatened listing rule provides ample flexibility, without sacrificing the Section 7 consultation requirement). While the ESA, and existing management guidelines and guidance already provide plenty flexibility for managing grizzly bears, the 10(j) would result in a loss of protections the ESA provides to grizzly bears and their habitat, by excluding activity on National Forest lands from Section 7 consultation.

We appreciate the “no-net-loss of core” approach. However, because historical habitat loss and fragmentation and human-caused mortality led to the extirpation of the NCE population, we believe the proposed 10(j) rule is likely to impinge on restoration of a healthy population of grizzly bears in the NCE.

It is unclear from the DEIS if any data supports the assertion that designating grizzly bears in the NCE as a nonessential experimental population will result in greater social tolerance. Particularly where in recent years, polls have shown an 88% approval rating for reintroducing grizzly bears to the NCE, it is unclear either: 1) why such a measure (10(j) NEP rule) would be needed; nor 2) whether such a measure in fact improves social tolerance. The bears translocated to the NCE should retain their ESA listing status, and the protections on the lands they inhabit should be maximized, including by requiring Section 7 consultation for activities that may impact grizzly bears or their habitat. It is also not entirely clear if in fact, the bears translocated into the NCE would indeed be geographically separated from other populations of grizzly bears that are not “experimental.”

The bears in the NCE have been and likely will be transboundary bears moving across the “border” between Canada and the United States, and while bears have not been documented on the U.S. side, due to the remote nature of much of the habitat, we do not know for certain if bears are currently occupying remote portions of the U.S. NCE. And current evidence is also less than clear regarding the Canada side of the NCE, with recent science indicating there may be a small

population of 3 females. In the absence of certainty, establishment of a Section 10(j) nonessential experimental population in the NCE should be avoided.

Evidence is clear that grizzly bears are threatened by motorized access, human conflict, livestock conflict, cumulative effects of logging, mining, energy and transmission line development. Establishing the NCE population as nonessential experimental is more likely to allow more (than maintaining their current threatened listing status) destructive activity (such as logging, mining, energy development, etc.), without analysis on the effects on grizzly bears and their habitat.

Recovery efforts should include all current suitable habitat, including areas south of I-90. And these efforts should be fluid enough to provide protections for grizzly bears in any areas they successfully colonize. This would hopefully alleviate dealing with problems like the essentially arbitrary lines that have hampered recovery efforts in the NCDE and GYE and the spatially truncated protections in the Bitterroot Ecosystem. Given the wide range of estimated carrying capacity (300-800+ from various studies) and the highly imperiled status of grizzly bears in adjacent British Columbia which create uncertainty about what will be needed, using all suitable habitat is of greater imperative. And the uncertain effects of climate change only exacerbate the need to establish grizzly bears in as much currently suitable habitat as possible. Although some suggest all will be well even in the face of a changing climate, others project a decline in huckleberries and the bumble bees that pollinate the berries. All of this uncertainty lends further support for protecting bears and all suitable habitat and translocating grizzly bears into all suitable habitat, both north and south of I-90. We encourage you to remove Management Zone 2 status as is currently proposed, for bears in suitable habitat south of I-90.

Moreover, moving bears from one population that enjoy the protections of the existing special 4(d) rule (50 C.F.R. 17.40 (b) in the lower 48 into the NCE only to remove many of those protections, would not serve the broader purpose of the U.S. Fish and Wildlife Service of protecting and recovering grizzly bears in the lower 48. These translocated bears would be put at risk as a result of the translocation itself and then face greater risks where they land, with fewer protections in place to promote their well-being and the establishment of a sustainable population. Creating a patchwork of listing status and management zones will create uncertainty, making recovery more challenging and management overly complicated.

CONCLUSION

Thank you for your consideration of our comments. We are eager to see this project finally start after several starts and stops and thank you for moving forward with reintroducing and translocating grizzly bears into the North Cascades Ecosystem. A healthy population of grizzly bears in the wild and massive NCE is essential for grizzly bear recovery in the lower 48. As noted above, we urge the Park Service and the Fish and Wildlife Service to ensure they rely on and employ the best available science in deciding on a translocation plan- with adequate numbers to establish a sustaining population in timely fashion (with far more needed than 25 over the course of up to 10 years), with a re-evaluation of the carrying capacity of the NCE, with no arbitrary boundaries limiting grizzly bears in otherwise suitable habitat, with adequate protections for the necessary suitable habitat, and by ensuring that grizzly bears in the NCE have the protections they need and deserve (pursuant to the existing special 4(d) rule by not adopting a rule to establish the NCE population as 10(j) rule nonessential experimental population.

On behalf of WildEarth Guardians and Nimiipuu Protecting the Environment, and with respect and excitement for seeing these great bears return to the North Cascades Ecosystem,

Wildlands & Wildlife Program Director
Western Environmental Law Center

Correspondence: I am in favor of No Action on this proposal.

What you fail to mention, is that we already have Grizzly's in the North Cascades. There is no physical boundary to keep them from repopulating even further over time from Canada, yet they stay stable in their current population...

There is only speculation & no hard evidence as to the previous population of grizzly's in the proposed North Cascades relocation area.

Most all algorithms for your relocation proposal, are based on the Canadian fur trade receipts for shipment of hides.

There is zero historic data on the location of these grizzly harvests, nor was there a viable market for these hides, such as the beaver pelts for hats.

The fur shipped east, from the western Hudson Bay hubs were collected throughout the far reaches of the western states, Alaska & the interior of Canada.

There is absolutely no evidence to prove that these grizzly pelts were specifically harvested from the North Cascades Ecosystem.

Based on these fur trade receipts as their evidence; even the currently-heavily populated I-5 corridor could have very well been a location of harvest, yet you have no plans to repopulate this area with the grizzly's...

Due to the fact that the NCE is purposefully within a National Park, comments are open to those unaffected, from across the entire country. Sadly, as residents we actually have very little say in this matter
This proposal has no merit & is solely based on emotion.

While there are a multitude of concerns, with the relocating & unnaturally inducing the population the grizzly in the NC, the Salmon runs in the watersheds should be forefront.

All Salmon, in all watersheds, will be in danger under the additional proposal from the Dept of the Interior; to make the entire State of Washington, save for the lower Selkirks,(S.E.B.E.R.Z. previously established) designated nonessential experimental population (NEP) grizzly areas.

We have failed at our attempts to restore fish populations due to many reasons. Every action & reaction, down to the lawsuits for only bio identical species to each river, has stalled or failed the salmon runs.

Proposing to purposefully bring in additional grizzly, who may consume upwards towards 100 pounds of fish per day during critical spawning periods, would put a final end to most salmon runs & fisheries as a whole.

I will cite the mountain goat implants as a failure. Man brought them in to the Olympic National Park, & the end result was a mass slaughter of the animals. They destroyed the habit where they were intentionally planted, so man corrected his mistake, removed a few at a huge expense & destroyed the rest. An utter waste of a population of animals, as the public was not allowed salvage rights to the meat.

We can no longer afford any mistakes, made to the WA State salmon species at this critical point.

This is a predator with no natural predators, when this goes wrong it will be disastrous for wildlife & humans alike.

Again, the question of importation of the Grizzly, to the NCP, should be weighed solely on merit, not on emotions.

Correspondence: Although I understand concerns from ranchers/farmers that the reintroduction may pose a threat to their livestock, the potential impact seems very small compared to the opportunity to reintroduce these animals.
Even if Grizzlies were to prey on commercial livestock the number of animals would be single digits, if any, given their intended range and rare opportunity for them to encounter commercial livestock.
I support moving ahead with reintroduction.

Correspondence: I love hiking in the north cascades -- it's such a beautiful and remote wilderness. I fully support the reintroduction of grizzly bears to the north cascades. They are an important part of the ecosystem.
I also don't think that reintroduction will significantly impact recreation in the area. Hikers are already required to store food in bear and animal proof containers due to black bears and other animals. I would love to see a grizzly in the north cascades!!

Correspondence: I urge you to choose Alternative C of the September 2023 Grizzly Bear Recovery Plan. The plan is very thorough and includes science-based studies of many aspects of the recovery of bears and the impact on the human and non-human environment. I strongly agree with the purpose and need statement of the plan and feel that the plan has addressed all concerns. These bears are an important part of the ecosystem and returning them to the North Cascades will have many benefits. The plan for relocation of bears, bringing bears from a similar food economy and bringing in just a few at a time, is very reasonable and intelligent. This will give both people and the bears a chance to adjust and managers will learn a great deal from the bears during this relocation process.

Education is key to bear and human safety. As in so many of our wilderness areas, hiking and hunting in the North Cascades has exploded in popularity. It is important that the plan adequately addresses the need for safety education in bear country and that funds are available for training and food storage improvements. There are many successful programs in the Rocky Mountains that can be drawn from for safety training.

Grizzly bears belong in the North Cascades. Alternative C is the best option.

Correspondence: I support the reintroduction of Grizzly Bears in the North Cascades. Humans are at a point where we need to correct mistakes we have made in the past and the regional extinction of a species is one of those mistakes. The area where the bears are being located is remote enough to prevent most human interaction.

Other efforts can prepare the public for this change, such as reporting the locations of the bears, increasing bear safety outreach and education, and mitigation efforts for human-bear conflict.

Correspondence: I was born in Seattle and have lived in the shadow of the North Cascades my entire life. My greatest memories were made along river banks, under dense forest canopies, and amid huckleberry patches. My love for nature inspired me to obtain a bachelor's degree in conservation biology, with a focus on wildlife ecology. Based on my personal experience in the NCE and my educational background, I strongly urge the NPS to pursue Grizzly Bear Reintroduction Alternative B.

My reasons are as follows: Option B places greater emphasis on the ecological aspects of reintroduction, rather than Option C, which favors the human dimensions. While some human-wildlife conflict management is necessary, the lethal management practices seen in places such as the greater Yellowstone ecosystem are better suited to a grizzly population that is already established and self-sustaining. I believe the earliest days of grizzly reintroduction, when the viability of the population is still undetermined, is not the time to deter grizzly bears in any way from practicing their natural behaviors or

moving into new territory.

In this case, education of the public about backcountry safety, bear awareness, leave-no-trace protocols, and additional permitting requirements are the best course of action. I have too often seen people treat wilderness spaces with utter carelessness. It is time for hikers and visitors to take responsibility for their own actions and safety. This is not the city, this is the wilderness. Humans are not at the top of the food chain, and a little humility will go a long ways towards improving public safety in wild spaces and increasing the odds of peaceful human-grizzly bear coexistence with minimal lethal methods.

Reintroducing grizzly bears to their natural habitat with restore a key element of a healthy, functioning ecosystem. By controlling ungulate populations, spreading seeds of native berries, and providing competition for other predators, grizzly bears will improve the quality of habitat for other species. A robust ecosystem is vital to withstand the effects of climate change.

When wolves were reintroduced to Yellowstone NP, it created an entirely new wilderness experience that attracted visitors from across the world. If the NPS and WDFW will insist on prioritizing economic growth, I need only point to the increased revenue from tourism the reintroduction of a marketable species such as the grizzly bear will bring.

Thank you for your consideration, and for allowing public comment. I hope the NPS will make the ecologically conscious choice and choose Alternative B.

Correspondence: I am in favor of NOT reintroducing grizzly bears into the NCE.

As far as impacts to humans go, just look at the signs in Canada. If a woman's menstrual cycle - bears are very much more likely to come in human range.

It is very nice to know when I am out that black bears and cougars are my biggest encounter challenge in the NCE.

I have been to Yellowstone and we all know folks get injured and die.

I read grizzlies make it back on their own, but for human's sake - please leave it be.

My 2 cents as a hiker.

Correspondence: I've commented on grizzly reintroduction to the N. Cascades over the years at other opportunities. I remain totally in favor of the proposal to bring in several breeding-age bears per year and at the same time educating the public about safe behavior in bear country. Safe behavior will overall result in safe outcomes. I have been around grizzlies in Alaska and British Columbia intermittently for about 50 years while climbing, hiking and sea kayaking. Although there are aberrant bears just the way there are aberrant humans, the risks are incredibly lower that those bears will result in injury to a person than with the humans deviants, assuming that that person practices safe behavior in bear country. I've been charged by a female black bear with a young cub, but have never had a problem with a grizzly even though once I found myself within 50' of one. Reintroduction will help restore a natural environment that has been missing a key large animal that will be beneficial in many ways, both environmentally and culturally. I don't think that the reintroduction decision should be derailed by ranchers or smaller-scale operations with domestic livestock, but I do think that there should be outreach to these folks to help them minimize impacts, including possible compensation for documented predation. Conservation groups have a possible role to help out, and governmental entities should help encourage this.

Dear Superintendent,

We are writing to give support to the plan for restoring grizzly bears to their historical range in the North Cascades Ecosystem (NCE) in Washington state.

My husband and I were conservation biologist working in Northern California prior to obtaining residency to Washington state in 1995. We have been avid outdoors people our entire lives as well as advocates for projects that help to protect and reintroduce endangered and threatened species back to their ancestral ranges. We are both proponents of the idea of "Rewilding" and the "3 C's"--conservation of Cores, Corridors, and Carnivores. "That vision is of dynamic but stable self-regulating and self-sustaining ecosystems with near pre-human levels of species diversity." (rewildingearth.org)

We are in favor of Plan B - grizzly bears restored to the NCE would be managed as a threatened species with the existing special rule (50 CFR 17.40(b)) under section 4(d) of the Endangered Species Act. However, if the preferred Alternative C is adopted then this would be preferable to doing nothing (Alternative A).

We feel that there plenty appropriate territory for reintroduced bears to thrive and maintain a healthily population in the NCE in Washington state. Our enthusiasm for this concept is supported by the reports from Peter Alagona, professor of Environmental Studies at the University of California, Santa Barbara and the founder and facilitator of the California Grizzly Research Network. Dr. Alagona has reported that over 20,000 grizzly bears currently reside in Europe in an overall area far smaller than North America.

It is time to restore the grizzly bear to their rightful home in the NCE in Washington state. It is important for their continued survival and our own.

We are submitting this same letter separately to your email, so that each of us gets a vote.

Sincerely,

[REDACTED]

Correspondence: Introducing grizzly bears to Washington State is a very bad idea. I lived in Montana for most of my life before coming back to Washington. Bear attacks happened in Montana and that was in a very low populated stated in relation

to its size. In Washington, the people that take advantage of hiking in the wilderness is much more common. If grizzlies are introduced into Washington, it will not take long for someone to get mauled. Grizzlies are an apex predator with nothing that naturally manages the population. Grizzlies also maintain large areas as part of their habitat so believing that keeping them to the parks is a nonsensical approach to game management. These bears will roam outside of the park and create nuisance instances that will force WDFW to lethally remove these animals to protect our state's citizens.

I can assure that you if introduced, there will be bear to human encounters that will most likely result in human casualties and bear deaths as a response to people being mauled.

Correspondence: From a ranchers stand point, Washington state has been poor at managing the current predator populations at best - This is especially true in Eastern Washington where habitat is more plentiful and where a smaller human population tend to live and thus our voices are less important to those in legislature and bureaucracies. This does not mean we are less important in our safety of personal lives, livelihoods and livestock protection, but this push to re-introduce dangerous bears into human habitat on purpose is gravely irresponsible.

Legislation continues to push fewer and fewer options for ranchers and communities in general when it comes to predators. Limiting or attempting to do away with hunting all together and with the perceived lack of rights of the residents by the state of one to defend life and personal property with current predators from coyotes, cougars, wolves and black bears among the most common. The addition of grizzly bears and failed programs from the stand point of farmers and ranchers in other states where this has been instituted would further decimate agriculture and put lives in danger in Washington state. This is a poorly thought out plan and takes aim at one of our marginalized and minatory groups, farmers and ranchers.

2022 saw an Increase in Bear Attack Numbers in the US. per an article published in The Guardian that confirmed an increase in the number of bear attacks in the US during 2022.

Currently there have been 48 fatal bear attacks in North America between 2000-2017. There are over 200,000 brown bears worldwide with being an Apex predator and protections already currently granted these introductions are unnecessary and the reason cited for this increase in fatalities was a combination of the steady growth of wild bears and also the continued encroachment of humans into bear habitats.

This insinuates that these are wild bears, going to these locations voluntarily, this plan seeks to put the bears there on purpose. Statistics show bears do not stay where they are put and have 150 to 500 mile radius of travel for habitat. This plan in my opinion is "knowingly" putting humans at risk and should be condemned for it's lack of foresight, unless putting humans at risk is your goal?

The lack of ability to protect one's livelihood and livestock is another way to decimate the American rancher to which less than 2% remain and the levels of regulation are burdensome at current level. In a time of shortages this would create undue stress and create even more shortages should this force ranchers and farmers out of business.

I ask for your consideration to strike this plan down based on the fact it is over reaching, dangerous and plain nonsensical to place additional burdens on the tax paying residents of Washington state that have voted this down previously. This is a push to assert will of special interest groups where it is not wanted.

Say NO to grizzly introduction to Wa State.

Correspondence: The North Cascades are a sanctuary for many outdoor activities. However, the existing grizzly bear population, as noted by the Washington Department of Fish and Wildlife, is already a concern. Adding more bears could jeopardize the mule deer and increase risks for visitors. I oppose this move.

There are no natural or many made barriers in place that keep Grizzly Bears out of the North Cascades. If the bears wanted to migrate further south they would. There are already Grizzly Bears in the North Cascades in the first place. The Washington Department of Fish and Wildlife makes me take a test each year to hunt Black Bear in the North Cascades. It's a test to ensure a hunter can distinguish between a Black Bear and a Grizzly Bear. So that tells me that the state is aware of an already established population.

The North Cascade wilderness areas are more like parks than a true wilderness area like in Montana or Wyoming. The amount of Grizzly to human conflicts that will be had in the North Cascades will be alarming, as many more humans use the North Cascade Wilderness areas than in the other 2 states mentioned.

We don't want any more Grizzly Bears than are already here. Maybe I'll say it louder for the people in the back. WE DON'T WANT ANY MORE GRIZZLY BEARS THAN ARE ALREADY HERE!

Correspondence: I am for option #1, no action. I do not think we should be spending millions of taxpayer dollars on this project number of reasons. I read the environmental impact statement. I do not think there is an adequate food supply for the grizzly, i.e. deer population in down. The U.S Fish & Wildlife agency stated that the grizzly eats 90% non-meat items.

They did not mention that this is the female grizzly, the male eats 75% meat per multiple studies. Also, the range of the male is over 400 sq miles. The proposed zone 1 is within one mile of my house, in an urban growth area. Why would you introduce grizzlies into an area where they would eat fish that the government spent million and millions on to protect? Andrew LaValle of the USF&W agency stated that he "did not anticipate any closures within the North Cascade" zone one due to grizzly introduction. But there have been yearly closures in the Cascade Pass, and Ross Lake areas due to bears. Why would he say this, if it has already been happening? Does he think the grizzly will be different? Or is he just lying to us? These closures impact my ability to enjoy the outdoors, but maybe this is the agenda, to close off wilderness area to the public.

Also, the comments from the affected areas should be weighted more than those from out of area, and those who will never be in the reintroduction area. This was one the arguments for reintroduction, "that people could enjoy viewing this iconic mammal again". How would they be able to "enjoy viewing" this animal??? I do not believe that there is any benefit to the reintroduction, the black bears are already providing any benefit that the grizzly can provide!! And the grizzly will drive the black bear out of their territory. One of the arguments for reintroduction is that there is a low chance of harm from encounters with a grizzly. They site Yellowstone Park as an example of the millions of people that are in grizzly territory but there is a very low attack rate compared to the amount of people. Well 99 % of those people are nowhere near their actual area. In the North Cascade proposed Zone one there are many hikers, farmers, ranchers. Will you be accountable for a dangerous encounter? I could go on but will stop here.

Correspondence: I support Grizzly Bear restoration in the North Cascades ecosystem. I'm a frequent hiker in and around the North Cascades (and down into Mazama on the eastern side) and would love to see the species finally return to the region for the following reasons:

- We hunted them to extinction and limited their habitat so we must help restore them
- They are a culturally significant creature for the indigenous peoples of this region
- They are a keystone species representing the entire health of the few glaciated regions we have left in this state
- They provide invaluable services to ecosystems that humans cannot replace

I also think it's crucial to begin reintroduction NOW. Waiting could result in too little too late and losing these bears forever.

As for the concerns of ranchers and farmers, I empathize with their worries for their livelihood. But I don't think reintroducing grizzly bears is mutually exclusive to challenges for agriculture in the area. These bears don't want to go to human settlements. They only do it when they have to...when their own habitat can't support them. So with reintroducing bears, we also must protect their habitat and food sources (berries, trees, prey, etc.), which will in turn disincentivize them from going near farms and ranches in the area.

I do NOT support the eventual delisting of the grizzly bears from the Endangered Species Act. First, hunting decimated these creatures before, and despite modern protections, there's no reason to believe hunters won't do the same again. Second, tags that have been discussed for grizzlies before are way too cheap and act as incentives for hunting an animal that has neared extinction before. Third, tags often act as a means to control the population, and in this case to control the bears entering human habitat, but they only want to enter human habitat when their own habitat is at risk. so a better process would be to protect more habitat for them in the first place.

RE: Draft Grizzly Bear Restoration Plan / Environmental Impact Statement, North Cascades Ecosystem

Hello,

99.9% of species that have lived on earth are now extinct. How many should be restored?

As a practical matter, glacial melt and reduction of resources, resulting in increased competition and need for animals to venture closer to human habitat for survival, are counter-indicative to these plans.

As business owners with vacation rentals in Marblemount at the park's entrance, we can attest to visitor trepidation upon the most minimal mention of bears, much less grizzlies. There will be no placating them, they will choose another destination for their holidays.

To quote a prominent Washington State resident, leaving things well enough alone, by not re-introducing grizzlies, should be a "No Brainer".

Correspondence: Having read through the draft grizzly bear restoration plan, I find the ecological arguments for restoration not compelling, and thus prefer Alternative A. Reintroduction of grizzly bears will require substantial behavioral changes from all park visitors, raising anxiety levels, and thus degrading the experience. While the document makes clear it would be permissible to kill a grizzly when life is at stake, I personally have no plans or desire to purchase and carry a gun.

Correspondence: We DO NOT need grizzly bears reintroduced in the North Cascades. You hope they will stay in the North Cascades. These bears will not stay in the North Cascades. Hope is not a course of action.
My hope to counter your hope: When these bears begin to venture out of the mountains, they venture toward the ocean. The west side of the state needs to be populated with both bears and wolves. That is the only way Olympia will understand why there is so much push-back on these programs from those of us on the east side of the state. These programs show no regard for ungulate populations.

Correspondence: I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations. I support Alternative C: Restoration with Section 10(j) Designation. Alternative C is the best choice for bears and the people who live in and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities. Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape. Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage. Thank you for taking the time to keep our North Cascades wild!

Correspondence: I support the restoration of grizzly bears to the North Cascades ecosystem. The grizzly bear is native to the area and, as the apex predator, has an important role in the complete ecosystem.

Humans have co-existed with grizzly bears for millennia and successfully co-exist today in regions with grizzly populations. The potential conflicts are grossly overstated. Loss of crops and predation on livestock are quite unlikely because of the abundant high elevation habitat available in the Cascades. Responsible behavior by hikers and backpackers has been shown

to minimize interaction with grizzlies and would work in the Cascades.

Without restoration efforts it is unlikely that grizzly bears will naturally migrate to the North Cascades. Restoration of the grizzly bear is critical to restoring the full suite of species native to the area and restoring a complete and healthy ecosystem. It is time for us to make room for the grizzly bear in this premier and historic habitat.

Thank you for considering my comments.

Correspondence: I am writing in support of Grizzly Bear reintroduction or augmentation in the North Cascades. Grizzly Bears have been eliminated from the vast majority of their native habitat in the lower forty-eight U.S. I believe our nation can and should accommodate expansion of currently very limited Grizzly Bear range, and the North Cascades is ideal habitat for this goal.

I support the goal primarily from conservation biology perspectives. But I also believe that the North Cascades will be a

richer and more complete ecosystem with a thriving Grizzly Bear population. From a personal standpoint, I have hiked and camped in Grizzly Bear habitat in the Greater Yellowstone ecosystem many times, taking proper wilderness precautions, and am better for it. I recognize that human - bear conflicts could arise from this action, but I believe that with wisdom, flexibility, and common sense care they can be minimized, The payoff, a truly wild North Cascades including a thriving Grizzly bear population shared with humans, seems a very worthy goal.

Thank you for considering my view.

Correspondence: I support reintroducing Grizzlies to the Cascades. They were residents long before humans pushed them out and should be allowed to come back to their natural space. Humans making decisions to enter the natural, wild areas of the world need to decide if they are willing to take on the risks and dangers inherent with sharing space with wildlife. If they are not willing to be in the habitat shared with Grizzlies, then they should stay out of the forests. We must learn to live in harmony with the other fauna of the earth and give back some of the space we forcibly stole from them so that all living in the ecosystem have a chance to thrive and survive.

Hikers and other recreational users being scared of bears is not a good enough reason to prevent reintroduction.

Correspondence: I am concerned that the reintroduction of grizzly bears would increase the likelihood of a lack of appropriate prey animals to support large predators. If this is the case, it seems inevitable that a certain percentage of these grizzlies would become problematically attracted to human food sources, as was likely the case with the couple who were killed traveling this year in Banff National Park. They did everything right, yet the bear, which was an older animal, still had the strength to snuff out their lives even though they had hung their food and used bear spray. If a population of animals is thriving well, it will naturally spread to other wild areas abundant enough to support that population. Grizzly bears in Montana and Idaho or from Canada could be allowed to spread to Washington naturally if conditions are favorable. I see no reason to speed the process artificially and fear that, in general, our state is much more highly populated with humans than places where grizzly bears are typically found. The potential for human/bear conflicts to occur is overwhelmingly high in our state.

Correspondence: I fully support the plan to bring grizzlies back to the Cascades. I think restoring wildlife areas is one of our core responsibilities as human beings and a civilized nation. I believe education will be paramount, as people are already scared that bears are going to become predatory towards humans if this plan goes through.

Being afraid of what you don't understand is not a good enough reason to prevent this plan from moving forward. It's more important that we do the right and ethical thing and restore grizzlies to the cascades.

Bears are cool. Let's be friends with the bears.

Correspondence: As an avid hiker and animal lover, I am requesting the NPS take "No Action" regarding the proposal to reintroduce Grizzly Bear to the Northern Cascades region. Reintroducing grizzlies will endanger the lives of both humans and bears. As a government agency, the NPS primary concern ought to be public safety. But reintroducing grizzlies to the Northern Cascades will endanger the lives of both humans and bears.

November 13, 2023

Dear Superintendent Striker and Supervisor Thompson,

On behalf of the Living Northwest Program at Woodland Park Zoo (WPZ), we appreciate this opportunity to submit comments in support of restoring grizzly bears to the North Cascades Ecosystem (NCE). The prospect of returning grizzlies to this ecosystem is a rare chance to right an egregious wrong from our past. We hope the long-awaited reintroduction process can move forward in a timely and seamless manner.

Each year, more than one million adults and children pass through the zoo's gates to spend time with the diversity of animals who live in our care. Our job as conservationists is to help ensure that, when visitors leave through those same gates, they know a bit more about the realities that wildlife face in their natural environment--and feel inspired to make conservation a priority in their own busy lives.

WPZ advocates for grizzly bear recovery in the NCE based on ecological, cultural, and moral grounds. As carnivore experts, we know that grizzlies play an outsized ecological role in the landscapes they inhabit, including by dispersing seeds through their droppings and aerating soil (thus helping to maintain healthy plant communities) through their prolific digging for bulbs and small mammals. Indeed, grizzlies are a key missing piece in the rewilding story of the NCE, and our scientific understanding of their ecological value as large, omnivorous mammals will no doubt grow by leaps and bounds once they are

back in this ecosystem. Given their diverse diet and ability to live in a variety of habitats, grizzlies will also contribute to ecological resilience in the NCE in the face of climate change.

Culturally, grizzly bears are iconic symbols of wildness who have held profound significance for some of the Indigenous peoples of this region for thousands of years. Over a century ago, the NCE's grizzlies--as elsewhere in the American West--were trapped, hunted, and poisoned without restraint by European settlers. We feel that it is our moral obligation to restore these magnificent animals to their historic range in the NCE, and that today's young people should inherit a different kind of legacy: one of tolerance and appreciation for grizzly bears. Of course, grizzlies have intrinsic value, too, and deserve to live free of persecution in the extensive wildlands of the North Cascades.

WPZ recognizes that reintroducing grizzly bears is not a trivial matter. After much consideration, we have chosen to support action Alternative C as generally presented in the EIS because we believe this alternative offers the greatest promise for the long-term recovery of a healthy grizzly bear population in the NCE. From 2008-2012, prior to our respective affiliations with the zoo, we were both part of a collaborative team that surveyed widely for grizzlies in the NCE using noninvasive hair-snagging corrals. Our team collectively sampled and genotyped more than 550 black bears, but we did not detect a single grizzly. These and other scientific findings indicate that grizzlies would be highly unlikely to re-establish a population under Alternative A, the no action alternative.

Although we would ideally prefer that reintroduced grizzlies receive the maximum legal protections currently provided to this species under the ESA, as presented in Alternative B, we understand that a successful reintroduction may require some of the flexible management tools afforded by a 10(j) designation. We thus support Alternative C because of the management flexibility it proffers, but we are nonetheless concerned with certain details included in the proposed 10(j) rules and hope that you will seriously consider making relevant changes in the final EIS. Specifically, we are strongly opposed to the proposal that agencies can potentially authorize conditioned lethal take licenses to members of the public, as put forth in two broad scenarios described on page 39:

Excerpt 1:

Conditioned lethal take [management zones 2 and 3.] With prior written authorization from the FWS or an authorized agency, livestock owners may lethally take a grizzly bear within 100 yards of legally present livestock if a depredation has been confirmed by the FWS or an authorized agency, and it is not reasonably possible to otherwise eliminate the threat by nonlethal deterrence or live capturing and releasing the grizzly bear unharmed in a remote area. If, after two weeks from the confirmed depredation, no further depredations have occurred, the permit would expire. Any grizzly bear killed under this provision must be reported within 24 hours to the FWS and the carcass surrendered to FWS.

Excerpt 2:

Conditioned lethal take [management zone 3.] The FWS, or authorized agency may issue prior written authorization to any person to kill a grizzly bear in management zone 3 when necessary for public safety or to protect property, but only if:

- The FWS or authorized agency determines that a grizzly bear presents a demonstrable and ongoing threat to human safety or to lawfully present livestock, working dogs, domestic animals, crops, beehives, or other property; and it is not reasonably possible to otherwise eliminate the threat by live capturing and releasing the grizzly bear unharmed;
- Once the FWS or authorized agency determines the threat is no longer ongoing, the FWS or authorized agency would notify the person, terminating the authorization;
- The individuals requesting the written authorization are otherwise authorized by the landowner or land management entity;
- The taking is done in a humane manner; and
- The taking is reported to the FWS, and the carcass is surrendered to the FWS.

Given the history of extreme persecution that led to the extirpation of grizzly bears in the NCE, we fear that grizzlies could be harmed or killed under the pretense of flexible management by licensed individuals who simply don't want to see this population restored. We're also troubled by the possibility that an unskilled person could seriously injure a grizzly in trying to lethally remove him or her, putting both the grizzly and the public at risk. We thereby request that any management activities involving the handling, relocation, or lethal management of grizzlies should be implemented solely by qualified FWS personnel or designees at an agency authorized by the FWS.

In addition, owners of livestock, domestic animals, or other property to which a grizzly presents a demonstrable and ongoing

threat should be required to exhaust all nonlethal measures available to them in their attempt to address this threat before relocation (or, as a last resort, lethal removal) is considered.

We are also concerned with the following proposed allowed take in all 3 management zones, as excerpted from page 38:

Unintentional take of a grizzly bear, provided such take is non-negligent and incidental to an otherwise lawful activity, the take is promptly reported to the FWS, and if the take occurs on national forest lands, that the USFS has maintained its "no net loss of core" approach and implemented food storage restrictions throughout management zone 1.

This allowance inherently places much emphasis on the USFS's commitment to "no net loss of core." As secure habitat is critical to the survival of grizzly bears, we'd like to see a more formal agreement between FWS/NPS and the USFS to help further protect core grizzly bear habitat and prevent the unintentional take of grizzlies.

Our next comment has to do with the health and safety of translocated grizzly bears. If grizzlies are to be reintroduced to the NCE--and we truly hope that they will be, soon--we trust that the welfare of the individual bears to be moved will be given utmost priority from start to finish. WPZ and our supporters are deeply committed to the wellbeing of individual animals, as well as to the conservation of wildlife populations. We believe, in fact, that these life-affirming values are inextricably linked.

Last, we know that this huge, wild ecosystem has more than enough space and food to once again support a grizzly bear population, but we will all have to work together to make sure we can coexist with these animals into the future. Cultivating coexistence between people and wildlife is a major priority at WPZ. We hope that your agencies will make the investments necessary to promote coexistence through public education and by providing myriad resources to advance bear smart communities.

WPZ is grateful for all that you have done and are currently doing to make grizzly bear recovery in the NCE a real possibility. Please know that we are dedicated to making the proposed reintroduction a success, and we encourage you to reach out to us if we can assist in any way. Our diverse staff includes experts in carnivore science, veterinary medicine, animal care, education, policy, and other pertinent areas--and we are here at the ready to help bring grizzly bears back to the North Cascades.

Sincerely,

██, Living Northwest Program, WPZ

Correspondence: I strongly urge the review committee to reject any brown bears being introduced to washington state, including the proposed north cascades restoration area.

as a frequent recreational user of these public lands, I do not wish to see or encounter any predator animals such as a grizzly bear.

please keep the brown bears in alaska, the rocky mountain region, and away from my family while we recreate in the state of washington.

our activities include backpacking, car camping, paddling, riding mountain bikes, fishing, hiking, trail running, exploring. we already contend with predators such as cougars, wolves, coyotes, black bear. I think that should offer enough balance to our ecosystem. the instinctive chase response of predators to humans moving through the woods at speeds greater than a slow

walk (like brown bears) makes them a hazard I wish to avoid while pursuing healthy outdoor activity.

thank you for prioritizing safety of people in our area by saying No to brown bear re-introduction

Correspondence: This plan to reintroduce the top apex predator of North America into Northeast Washington is insane and poorly thought out. Because of this recklessness, people's lives will be put into jeopardy. Families going out for a fun camping trip and hikers alike will be targeted by these monsters. There have already been a number of people eaten this year by grizzlies. This plan will put lots of people and animals in danger.

Correspondence: I am favor of bringing grizzlies back to the north cascade mountains. They lived there for thousands of years before being wiped out in the 1800s. Shame on us for that! We have a chance now, to restore the biodiversity of this area. Grizzlies are important to the Eco system that our lives depend on. They are omnivores that help maintain the Meadows and improve soil for all things to grow.

People will have to learn to live with grizzly bears, to respect them and their space and be safe. I hope mankind is up for this. It's time to try and bring these magnificent animals back to life.

Thank-you

Correspondence: It seems reintroducing Grizzly bears will only lead to eventual direct human and grizzly interactions.

At the bottom line, this is why I am directly against reintroducing Grizzly bears into the proposed reintroduction zone in Washington state.

Having read and examined the detailed and numerous comments from DFW, supporting researchers, public comments, and media, I have concluded that despite considering myself generally being extremely pro conservation, wild spaces and wilderness areas; it simply is not a cost effective solution for what appears to be somewhat egotistically motivated action.

Bears already move in and out of the northern area of the reintroduction zone and inserting bears with the intention of breeding pairs is a non-assured solution that will cost taxpayers hundreds of thousands if not eventual millions and given the track record of DFW and other management groups like the tribes around salmon conservation and protection, I do not believe any of these groups competent enough to produce or maintain a sustaining population of any species, let alone a major predatory mega-fauna mammal species, especially when they put several towns, dozens of recreation areas and major trails in national parks and public land in direct risk of interaction.

Furthermore, the general sentiment and attitude of the wider public appears to be against reintroduction and I feel obligated to admit my bias in belief that many of the direct supporters and groups in support of much of the proposed reintroduction and reintroduction zones have little to no direct interaction with the specific areas for reintroduction. I can assert I could be incorrect in assuming most of the people involved in making these decisions have little to no interaction with the areas they believe ideal for reintroduction. Those who use related trails, access national parks, own land, ranch, farm or raise livestock or use the areas directly for business or recreation, or live there, should have a greater say, not government funded, government employees seeking to prolong their own funding and achieve personal agenda either individual or respective to their organization.

Thank you for receiving comments,

██████████

p.s. A curious question raised in conversation with a friend over this matter I believe worth considering:

Would Grizzly reintroduction present the potential for the Wash. state government and/or groups associated with reintroduction to be held accountable in lawsuits for wrongful death or related events, should an almost certain eventual fatal interaction occur? At face value, many including myself would assume that most designated areas would not need to reassess or change current accepted 'entry risk' related materials; signs, info, visitor info, rec info etc. However, these "risks" for decades have been assumed simply to never include grizzlies. Being that they present a wholly different kind of risk, therefore mitigation, preparation and potential for harm, could they be considered as an introduced risk placed by the government directly onto the public, that lead to a fatality?

Thank you.

Correspondence: An additional comment based on a NPS experience and living in the North Cascades Stehekin River Valley as well as the deadline as well as choosing an EIS alternative: NO ACTION

The year we visited Glacier National Park in the early 1980s two women in a tent in an NPS campground were killed by a grizzly. We attended an evening play put on by NPS seasonal employees. After the play ended, we had a conversation with a ranger about the bears, since we had found trail closures during our visit and the suggestion that one wear bells. The ranger said, off the record, the bears were out of control.

The grizzly bears could become a large problem for NPS administration. More staff needed for not only monitoring bears but also for protection of visitors and campsites along the trails. Is this affordable? Is it a good priority for the NPS? Grizzlies, omnivorous top predators are not exactly stewards of the wilderness. Communities living in and around the North Cascades as well as visitors/hikers communing with nature are stewards of the land.

Very few families would visit just to experience the possibility of seeing a real Grizzly bear. They can go to Yellowstone and stay inside their cars! We experienced that too, including a traffic jam of visitors, and photographers overseen by park employees, [REDACTED]

Correspondence: The proposed plan to transplant grizzlies to the NCE unacceptably vague and not supported by good arguments or facts. Option A is the best and only reasonable plan proposed.

1) If there is a case for the "need" to transplant grizzlies to the NCE, the draft proposal does not make it. After reading the entire proposal, the reader is left with the impression that the driving force behind the proposal is a misguided belief that it would be "cool" to have grizzlies back in the NCE. Indeed, the only case that is made for transplanting grizzlies to the NCE is that some humans want them there, not that it is in the best interest of the bears or the ecosystem.

2) Proposals B and C fail on a straight up cost benefit analysis. The draft proposal does not fully confess the cost of transplanting the grizzlies, but it will surely be in the tens if not hundreds of millions. There is no explanation as to how this

is the best use of limited resources to protect grizzlies or help push them off the endangered species list.

3) The NCE is extraordinarily large and encompasses far more area than what most locals consider the North Cascades. The proposal gives very little indication where in this vast area the bears would be transplanted or what the criteria the relocation area would be. A stark difference between the NCE and existing grizzly zones is the proximity to large human populations. If there is to be meaningful comment on any plan, it should spell out with precision where the bears would be released and why. As is, the proposal is unacceptably vague.

4) Untoward interactions between humans and grizzlies are not "rare" as claimed in the proposal. Wherever there are humans and grizzlies in the same areas, there are bad interactions. Indeed, people are attacked and killed by grizzlies every year.

5) Those of us who spend a lot of time in the backcountry of the Cascades (the real backcountry) have always thought it was a good thing that we didn't have to worry about grizzlies, especially given how thick the undergrowth is in some places deep in the mountains. Our behavior and enjoyment of the backcountry in grizzly country is far different than here in the Cascades. We like not having to worry about grizzlies. Most people who think it is a good idea to put grizzlies here have not spent enough time in grizzly country.

6) Beware of unintended consequences. From what I can discern, grizzlies have never been transplanted into an area that has such a huge amount of human traffic. It does not seem that there has been enough consideration given to what some of the problems that could arise from the action.

"Findings

Based on the best scientific information available, as described above and in accordance with 50 CFR 17.81, we find that releasing grizzly bears into the NCE would further the conservation of the species, but that this population is not essential to the continued existence of the species in the wild."

This comes from the proposed rule.. this population is not essential. Thats clear. We do not need them roaming our state.

Correspondence: I am pushing my 80th year and have been a BCHW member for nearly the past 18 years. I've loved all of the adventure, fun and beauty of those years as much as I have enjoyed my somewhat earlier years of living in the Canadian wilderness filled with freedom, joy, and the challenges that living in 'the wild' brings. There was never a time I regretted it that I had my horses with me, and often I was actually relieved they were there! Of course, some special adjustments had to be made for the horses occasionally, but that was rare, well worth it, and not much of an interruption.

Introducing one of our greatest and most fascinating animals back into their world will require some planning and adjustments, but I believe it will be well worth the effort not only to our environment but also to the humans. I fully encourage having all animals returned to their own environments to the degree possible, and would encourage it if it is at all possible.

Thank you for this opportunity,

Correspondence: Thank you for the opportunity to comment. I am in favor of the reintroduction of Grizzly Bears to the ecology of Washington State. In so much as we are aware that wildlife does not conform to human boundaries, I respect opposition to this plan. It is impossible to fully know the final outcome of reintroduction however this should not come at the expense of an attempt to support and encourage a native species to re-occupy the land it is indigenous to. As stewards, it seems right and appropriate. As an avid backpacker for the last 40+ yrs., I have had my share of experiences with black bears, mtn. goats, cougars and even a wolverine. To me those memories are priceless. I would love to add a grizzly bear to my list, but more importantly I would like to know that my Federal Government is honoring its duty to protect habitat and environments from loss and destruction as well as restoring whatever we can. My ideal option would be Plan B. My impression is that too much weight is given to those who look on public lands as a source of revenue. I am open to Plan C where introduction comes with the caveat of removal of problem individuals should the need arise. I truly believe that one of the things that makes the Pacific Northwest Region of the United States popular is our expansive Wilderness/Native environments. The future potential of healthy ecosystems is something we undervalue. I hope that future generations can experience the awe and majestic beauty of our country.

Correspondence: To whom it may concern:

The North Cascades grizzly bear reintroduction proposal rests on a modeled estimate of carrying capacity for the North

Cascades Ecosystem (NCE) of 280 grizzlies (Lyons et al. 2018). While the use of a Resource Selection Function (RSF) based on activities of 27 collared grizzlies (Proctor et al. 2015) is helpful to discern general patterns of habitat use, Lyons et al (2018) acknowledge that every ecosystem is quite different, and I share that concern. As an example, the annual vegetation and plants with tuberous roots that dominate avalanche paths and alpine areas in Purcell, Selkirk, and Cabinet Mountains (RSF modeled area) likely have higher forage value for grizzlies than alder and woody vegetation that dominates avalanche paths in the NCE. Large carrion items will be fewer in the heavily vegetated complex terrain of the NCE, and some large-bodied ungulate species (moose) are not present except in the far northeastern corner of the recovery area.

The estimate of number of female grizzlies the NCE can support comes directly from the overlay of this RSF, built for other ecosystems, on the NCE. As a result, the entire reintroduction effort would hinge on whether assumptions of ecosystem similarity between NCE and the Purcell, Selkirk and Cabinet Mountains are correct. Specifically, the proposed reintroduction assumes that grizzlies move through and use the NCE in the same way they would through the Purcell, Selkirk, and Cabinet Mountains. A robust test of that significant assumption is lacking. Grizzly scat metabarcoding for plant material and other grizzly forage from the Coastal mountains in BC would better inform how well this RSF may apply to the NCE.

Current estimates of grizzly forage are extrapolated from the Cabinet-Yaak ecosystem. During the early spring, when bears are most nutritionally limited, their forage in the Cabinet-Yaak ecosystem includes high concentrations of grasses and sedges as well as meat - primarily deer and moose carrion (Kasworm et al. 2021). These sources of food, specifically nutritionally rich meat sources would not be equally available in the NCE, especially along the western slopes. Grizzly bears also prefer meat to berries in the fall in the Cabinet Yaak, which is believed to be because larger bears require more nutritionally dense higher quality forage (Welch et al. 1997). If these currently unvalidated assumptions of ecosystem similarity are wrong, translocated bears will likely exhibit increased movement, come into greater conflict with humans, have increased mortality, or exhibit low fecundity resulting from diet limitations.

Extending beyond forage resources, a second major assumption of similarity between the RSF area and the NCE relates to human interaction and human related disturbance. Over 2.5 million people recreate in Mount Baker Snoqualmie National Forest annually, making it one of the most visited forests in the country (nationalforests.org). This leads to a situation where human/grizzly interaction may be far more common than in the west slopes of the Rockies, especially if grizzlies are placed in the ecosystem (translocated) rather than allowed to naturally move in where forage resources and lack of disturbance allow. In the RSF completed by Proctor et al. (2015) human presence is modeled through building density which is likely to result in a mismatch between the Rockies focused RSF area, and the NCE where high density backcountry recreational will not be well predicted by buildings.

In this Grizzly bear EIS, Alternative A (no action) is the patient and intelligent choice. It allows the state fish and wildlife agency to do their job and continue to manage wildlife populations in our state. WDFW has a proven record managing a growing population of once extirpated carnivores (gray wolf) and will be able to effectively manage Grizzly bears as well, once they return on their own. Given the human population density surrounding the NCE and the high-density recreational use of the area, the risk of impatience through premature reintroduction is profound. Human-grizzly conflicts are likely to quickly erode social tolerance, especially because the population was sourced through reintroduction.

Correspondence Type: Web Form

Correspondence: The Washington State Department of Natural Resources, State Uplands program (DNR) recognizes the conservation opportunities of reintroducing grizzly bears in the North Cascades Ecosystem (NCE) grizzly bear recovery zone. If the decision to reintroduce grizzly bears is made, DNR's preference for the proposed grizzly bear recovery plan is alternative C with grizzly bears being a 10(j) nonessential experimental population (NEP) under section 10 of the Endangered Species Act. As mentioned in the proposed rule published by the USFWS under alternative C, "the best available data indicate that reintroduction of the grizzly bear to the North Cascade Ecosystem, within the nonessential population area, is biologically feasible and will promote the conservation of the species." DNR does not anticipate additional management restrictions within the North Cascade Grizzly Bear Recovery Zone.

The Washington Department of Natural Resources, State Uplands program (DNR), Northeast Region, hereafter referred to as "NE WA DNR", manages approximately 151,000 acres of state trust lands along the outer margins of the North Cascades Grizzly Bear Recovery Zone (NCGBRZ). As a fiduciary, DNR's primary objective is to provide a perpetual source of revenue to trust beneficiaries, while also providing jobs, commodities, clean water, wildlife habitat and recreational opportunities for the public. As a working forest, DNR maintains infrastructure in the form of drivable roads that are utilized for timber extraction, wildfire suppression and public use. The majority of roads on DNR-managed land within the NCGBRZ are at a maximum road density of 2.5 mi/mi², with publicly accessible roads being not denser than 1.5 mi/mi², on average. Road densities greater than 2 mi/mi² (or 1 mi/mi² for publicly accessible roads) are not conducive to grizzly bear recovery and will likely result in reduced occupancy on DNR-managed lands within the NCGBRZ. DNR continues to manage for grizzly bear habitat within the NCGBRZ, including no net increase in open-road access within the vast majority of DNR-managed land that overlaps with the NCGBRZ.

In regards to recreation planning, DNR recognizes that increased agency funding will likely be needed to reduce and manage bear-human conflicts on DNR-managed lands within, or adjacent to, this North Cascades Ecosystem. To best address potential bear-human conflicts, DNR requests that the US Fish and Wildlife Service make radio-collar location data available to DNR staff, with data confidentiality restrictions.

Grizzly bears have played a pivotal role in the health of the North Cascades Ecosystem until they were extirpated by humans in the early 1900's. Reintroductions will initiate the restoration of the natural system and reintroduce a historic legacy and

icon to the area for future generations to come. Thank you for the opportunity for DNR to comment of this management decision.

Correspondence: To whom It may concern,

I am against the re-introduction / restoration of a Grizzly bear population in the North Cascade mountain range. I don't believe it is responsible to introduce an Apex Predator into areas of human communities. We live our life here and raise our families. We go out on our land, feed our animals, tend to our chores and we want to continue to do these simple activities in safety and without fear in our heart over very large and unpredictable Grizzly Bears. So many of us live outside of city limits and in rugged areas, near creeks and rivers and with fruit growing on our land. I don't feel I am unreasonable to think my own land could be considered attractive to a Grizzly Bear. After all, the common Black Bear seems to find my land attractive. I vote option A. NO ACTION. NO restoration of Grizzly Bears!

Thank you for hearing my opinion

Correspondence: I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C: Restoration with Section 10(j) Designation. Alternative C is the best choice for bears and the people who live in and visit the North Cascades Ecosystem. The plan is wisely modeled on what's worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Furthermore, the 10(j) rule will give people more management tools to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you for taking the time to keep our North Cascades wild!

Correspondence: I am a member of the Backcountry Horsemen of Washington / Grays Harbor Chapter. After reviewing the Draft Grizzly Bear Restoration Plan, I support Alternative A / No Action. I have a concern with future recreation and trail access in the NCNP and adjacent National Forest lands and how it might be affected by reintroduction of grizzly bears. Alternatives B and C do not speak clearly to this issue and how it might be managed for both bears and people. Substantial numbers of recreationists now use the PCT and it is anticipated that use will increase on the PNT. As a retired Forest Service career recreation planner, I am sensitive to and support managing for a healthy, fully functioning ecosystems. I feel both bears and people can coexist in a wilderness/backcountry setting. In the short term the Canadian effort to reintroduce grizzly bears into the area just north of the International Boundary will result in bears migrating into the North Cascades Ecosystem. In the long term this will give the land managing agencies the opportunity to develop management strategies that will be successful for both people and bears. Such a plan of action will likely result in more public support for future reintroduction of grizzly bears into the North Cascades Ecosystem. Backcountry access and trail maintenance need to be clearly considered!

Correspondence: As a hiker and horse packer in the Mt Baker - Snoqualmie, Pasayten, Okanogan Forests and Wilderness areas, and a rural resident with livestock living right against Prairie Mt, I support having a natural ecosystem, including predators such as the grizzly. My preference, however, would be for a smaller grizzly population to limit impacts due to limited food supply. I also have concerns about release sites...Grizzlies are extremely intelligent, and will of course be interested in the easiest food sources. I don't want that to be my chickens, foals, etc. So, yes, a limited number of grizzlies in true wilderness, but away from human habitations please.

Correspondence Type: Web Form

Correspondence: Hi all, [REDACTED] here.

I'm a new comer to Stehekin, arrived May 17, 1980, heard St. Helen's go boom the next morning, spent that summer and the next four working as a carpenter for the NPS. I spent my first winter here in 1985 and have been a resident since, mostly carpentry and maintenance work for the private sector. I am fairly active in the Park and surrounding Wilderness lands on a year round basis. I support species diversity and the protections needed to allow the NPS and wilderness lands to remain a healthy natural habitat for all living things common to the area, to include those populations that have been severely reduced by human activity. For example I'm quite happy to hear of successes with the reintroduction of fischers. I'm curious about the Wolverine population surveys being done by the Cascade Wolverine project. And I keep track of wolf tracks, happy to see that apex predator making new packs and spreading west after walking into Washington from Idaho in about 2008.

And so I totally support the idea of Grizzly bears living in these mountains. I figure, like the average British Columbian resident, I too could learn to live with grizzly bears.

I'm not as sure about my level of support for the Park's idea of reintroduction for various reasons.

One reason is the readiness of the stehekn community to co-exist with griz. I think more education is needed here. While the park biologist say the likelihood of seeing a grizz is low, I would point out that our annual kokanee run would be an obvious attraction to bears in the fall. I suspect that any grizzly spotted by a stehekin resident when they trek from their front porch to a car would be considered a threat to be eliminated. If a black bear huffing in an apple tree is threatening and gets shot, a grizz just looking huge will not last. I don't see a reintroduction plan being much more than a way for grizzlies to get killed.

I know the government doesn't work this way: take this money, use it instead here, but I think making the land more receptive to grizzlies, say, in the form of a wildlife overpass on highway 20, and spend a little on education, say, bring some Canadians down here to talk to locals about how they live amongst big bears without shooting every one they see, or getting the NE Washington tribes to come here and talk about how grizzlies don't scare them, and in fact are sacred to native people, may be

better first steps for eventually seeing Grizz back in these mountains.

I see the Park reintroduction plan as a set up for failure.

Allowing the bears to naturally migrate into the area, maybe with the help of the native tribes reintroduction plan, seems a better course of action.

And go ahead with a highway 20 overpass-call it your reintroduction plan- and give the bears and other animals a safe and natural way to travel across that barrier, which highways are proven to represent even if not as busy as I-90 where that very successful overpass was completed in 2018.

One impact to Stehekin if bears do wander into the North Cascades will be increased tourist visitation. There may be people here that can't envision being other than terrified at the idea of a grizz, but there are hordes of folks that will come to Stehekin simply to be near a mountain, a big tree, and possibly somewhere out there, a Grizzly bear.

Real statistics honestly interpreted don't lie: I'm more likely to die in traffic or by lightning. So far the cougars haven't pounced and the wolves aren't circling. If you value your cat, you keep him in. If your pigs are threatened you build a pen. Maybe you need a vault for your chickens. Grizz will require coexistence too. The dogs bred for bear deterrence could become popular here for those with cattle and horses. I bet we can figure it out and allow grizz back in the landscape. Let them walk in.

Keep it wild.

Cheers, [REDACTED]

Correspondence: Washington already has a rebust amount of black bears. That being said, you took spring bear away from us when you never should have. We have wolves killing all of our game, the area I have lived my whole life has the lowest deer and elk numbers I have ever seen. I sure have seen a lot of predators though! I'm 100 percent against the reintroduction of grizzly bears in Washington. It's a horrible idea just like allowing these wolves to ruin our ecosystem. We need to go back to managing our game, not pushing to have apex predators thrive. Grizzly bears are way more dangerous and the ones we already have here give us issues. The problem grizzlies you relocate just become someone else's problem! Please start considering peoples facts over here on the Eastside of Washington. A lot of bad decisions you guys have made has effected us way more than you guys on the Westside. No grizzly bear reintroduction!

Correspondence: I am an environmentalist/conservationist by profession, yet I still have major concerns about the reintroduction of grizzly bears to the North Cascades ecosystem.

We do not have an ethical obligation to restore them to their "original home", as that home is now a much different place than it was when grizzlies roamed there. It seems irresponsible to think otherwise, and not at all ethical, as suggested. There are now thousands of PCT hikers moving through every year, plus countless numbers of other recreationists. Every fall day, there are miles of cars lining up and down Highway 20, parked near trailheads, a far cry from the "wildness" of the past. Yes- bears and humans have found a way to coexist in other places (Montana, BC, Wyoming, etc.). But the Washington Cascades are not those places; in addition to being more densely populated (by humans), there are many more people frequenting these areas from urban centers. Conflicts will inevitably occur, resulting at the very least in the destruction of the bear. Again, it seems irresponsible to assume otherwise.

The effects of grizzly reintroduction on an ecosystem would be far less than of a top predator such as the wolf, which actually would help drive/engineer the ecosystem to a much greater extent (as we've seen in Yellowstone with elk, plant communities,

etc.). It isn't to say that there would be no net positive effects on a community or ecosystem level, but the bears are more of an indicator of ecosystem health than a driver of it.

Bottom line is that if reintroduced, most will likely end up getting shot, either legally or illegally. People won't hesitate to claim "I killed it in self defense!" in that situation, and being unable to prove otherwise, it will be unenforceable. The additional Section 10(j) designation will allow people to shoot the bears with even less justification. So it raises the question- who is this actually for? Clearly not the bears...

Sedro-Woolley, WA 98284

Re: North Cascades Ecosystem Grizzly Bear Restoration Plan / Environmental Impact Statement

Submitted via National Park Service (PEPC) Planning, Environment & Public Comment website

Dear Superintendent Striker:

I'm writing to express my support for the National Park Service's decision to restore grizzlies to the North Cascades Ecosystem in Washington State.

Historically, grizzlies played an important role in the ecology of the North Cascades, but by the mid-1960's, they had been entirely extirpated from the area. As someone who has hiked, climbed, and skied extensively in the backcountry of North Cascades National Park, Glacier Peak Wilderness, and the Pasayten Wilderness since 1971, I feel it is high time for these magnificent animals to be brought back. I have also spent time in parts of Wyoming, Idaho, Montana, Alaska, British Columbia, and Alberta where grizzlies still roam freely and had the thrill of seeing them in the wild on several occasions. This restoration plan gives me hope that future generations will have the same opportunity to see them in the North Cascades.

I also support Alternative C with the accompanying 10j designation and rule and am providing comments to the US Department of Fish and Wildlife separately on this.

One concern I have is that even though the Plan/EIS map shows the southern release area as including part of the Glacier Peak Wilderness (GPW), the Plan does not include analysis of potential impacts in the GPW. I hope that this apparent discrepancy is corrected and that it does not reflect the intention not to release grizzlies in the GPW.

I appreciate this opportunity to comment and would like to thank those who prepared the Plan and EIS.

Sincerely,

██████████

My family with young children loves to explore the North Cascades and we would feel unsafe and unable to do so if grizzly bears were reintroduced. It already feels much more challenging now to adventure in the mountains with the amount of people that are getting out there these days. Human recreation has increased so much over the last handful of years, and I wish not put grizzly bears into lands that so commonly explored by humans. I'd be willing to bet that the number of people wishing to avoid grizzlies would far exceed the number of people wishing to see them in their natural environment.

Re: Draft Grizzly Bear Restoration Plan /Environmental Impact Statement

Thank you for allowing us the opportunity to comment on the U.S. Fish and Wildlife's plan to restore grizzly bears to the the North Cascades

Mighty Earth (www.mightyearth.org) is a global advocacy organization working to defend a living planet. Our goal is to protect half of Earth for Nature and secure a climate that allows life to flourish. Our team has achieved transformative change

by persuading leading industries to dramatically reduce deforestation and climate pollution throughout their global supply chains in palm oil, rubber, cocoa, and animal feed, while improving livelihoods for Indigenous and local communities across the tropics.

We've helped advance major new forest and climate policies around the world, helping break the link between environmental destruction and economic growth. Mighty Earth's approach, team and the results of our work have been featured in Inside Philanthropy, Bloomberg, The New Republic, New York Times Magazine, The New York Times, and many other outlets. One of our core program pillars is the importance of rewilding for ecosystems and the climate.

The last grizzly bear spotted in the North Cascades was in 1996. Once a key species for the formation of the North Cascades ecosystem, the population has been decimated by hunting and other human activity like logging, mining, gas drilling and land development. Grizzlies have been listed as threatened under the Endangered Species Act since the 1970s, and their former habitat has been maintained and protected, but the bears have not returned. Before the 19th century, the population of grizzlies in the U.S. is estimated to be as much as 50,000-100,000.

Mighty Earth believes that restoration of key species - especially top predators - is vital to creating a wilder planet. We are submitting this comment specifically to highlight the broader impact of grizzly bears on the ecosystem. Our rewilding work is supported by a recent study (<https://www.science.org/doi/10.1126/sciadv.aat1869>) that shows restoring wildlife around the world can cause trophic effects that remove 95% of the carbon from the atmosphere needed to keep warming to the 1.5 degree target.

We strongly support Plan C as described in the proposal to reintroduce grizzlies to the North Cascades ecosystem. By introducing 25 non-problem grizzlies over the next decade and managing them as an experimental population, human-bear conflict can be reduced, prevented and responded to. Reintroducing the bears to the ecosystem is not a quick fix, but a long term solution that could allow a resurgence of this important predator in the next 100 years. Plan C should solve for any local objections about potential contact with humans. This is further supported by the peaceful coexistence of humans and grizzly bears in the Greater Yellowstone and Northern Continental Divide Ecosystems, each of which are home to more than 1,000 bears.

The removal of the grizzly population from the ecosystem likely caused a cascade of impacts, and the reintroduction of the population can help restore balance. The importance of predators to ecosystems is now well understood, and well described in the U.S. Fish and Wildlife plan; in brief, they can help spread the seeds of plant life through ingesting and excreting seeds and fruit, keep prey species in check, and even provide carrion for scavengers. Some behaviors of grizzlies can even alter the topography of the landscape. The reintroduction of this keystone species will ultimately shape a more biodiverse, balanced and healthy ecosystem.

In addition to the benefits to the ecosystem and climate, grizzlies have a historical cultural importance to Indigenous peoples in the area. The Washington Post quoted Scott Schuyler, a policy representative for the Upper Skagit tribe, as supportive of the restoration plan: "The grizzly bear's survival is, in a sense, the survival of our culture, our history." Additionally, the plan cites the ability for all people to have positive sightings of grizzly bears, an iconic American species, in their habitat, something that has been largely impossible in recent years.

This visionary and innovative plan would be a hugely important step in preserving an important keystone species. Thank you for giving us the opportunity to submit a comment. We will continue to advocate for rewilding and the importance of protecting keystone species like grizzly bears.

Respectfully submitted,

Vice President of Programs
Mighty Earth

Re: Safari Club International Comments on the Proposed Rule, Endangered and Threatened Wildlife and Plants; Establishment of a Nonessential Experimental Population of Grizzly Bear in the North Cascades Ecosystem, Washington State, and the Associated Draft Environmental Impact Statement, 88 Fed. Reg. 67193 (Sept. 29, 2023)

Dear Superintendent,

Safari Club International ("SCI") appreciates the opportunity to comment on the U.S. Fish and Wildlife Service's ("Service") proposed rule to establish a nonessential experimental population ("NEP") of grizzly bears in the North Cascades Ecosystem ("NCE") in Washington State and the associated Draft Environmental Impact Statement ("Draft EIS") prepared by the Service and the National Park Service ("NPS"). SCI takes no position on the proposed introduction of grizzly bears to the NCE. However, SCI poses the question why the Service needs to reintroduce grizzlies in the NCE, given the expectation that bears are likely to move south from Canada, the growing human population, and the consequent risk of human-bear conflicts. SCI urges the Service to ensure this introduction is consistent with the Service's historic recognition of the recovery of grizzly bears in other ecosystems and its efforts to remove grizzly populations in the Greater Yellowstone Ecosystem and, potentially, the Northern Continental Divide Ecosystem from the Endangered Species Act ("ESA") lists.

SCI encourages the Service to collaborate with interested stakeholders, the State of Washington, and tribal authorities to implement a management plan for these grizzly bears, and to ensure the introduction of grizzlies does not negatively impact Washington's sheep, elk, deer, moose, and other wildlife populations and related hunting opportunities. SCI appreciates that the Service is willing to work with the Washington Department of Fish and Wildlife ("WDFW") to ensure the State has needed flexibility to manage a new grizzly bear population. SCI strongly agrees with the Service's determination that the experimental population would be "nonessential." Of the considered alternatives, Alternative C in the Draft EIS will provide the most flexibility and consistency for grizzly bear management in Washington.

SCI offers the following comments to help in finalizing the Draft EIS and Section 10(j) rule.

Safari Club International

Safari Club International, a nonprofit IRC § 501(c)(4) corporation, has approximately 75,000 members and advocates worldwide, many of whom live or hunt in Washington. SCI also has many members who guide hunts in Washington. SCI has five chapters in Washington and multiple chapters in British Columbia and surrounding states.

SCI has submitted numerous public comments regarding the federal listing status and management of grizzly bears in the United States, including a comment on the 2017 Draft North Cascades Ecosystem Grizzly Restoration Plan and related environmental analysis. SCI has also defended science-based decision-making involving grizzlies in the United States in court. For example, SCI intervened to defend the delisting of the recovered Greater Yellowstone Ecosystem population of grizzly bears.*1 SCI supports efforts in Congress to delist recovered grizzly bear populations, consistent with Service efforts, some dating back 20 years, to remove grizzly populations from the ESA lists due to their successful recoveries.

Based on its history and current support for delisting recovered grizzly bear populations from the ESA, SCI urges the Service to review the proposed rule and Draft EIS, with an eye to ensuring the proposed introduction is consistent with the Service's efforts to delist recovered grizzly populations. The Service should clearly and repeatedly confirm that introducing this NEP does not restrict its efforts to delist the Greater Yellowstone Ecosystem and Northern Continental Divide Ecosystem grizzlies.

Management Flexibility for State and Tribal Authorities

SCI supports Alternative C in the Draft EIS, restoration with ESA Section 10(j) designation, to allow for flexible management of the NEP and to specify what "take" of the species is allowed under the ESA. Alternative C offers the most management flexibility for Federal, State, and Tribal authorities. However, the proposed rule does not go far enough. Without proper management tools to sufficiently address conflicts between grizzly bears and humans and unacceptable impacts to prey populations, the potential negative effects of grizzlies are likely to erode social tolerance for the proposed restoration among some groups. As discussed below, the Service should expand the management options available to States to protect wildlife populations (and the dependent recreational activities) from negative impacts associated with an introduced grizzly population.

a. The 10(j) rule should allow intentional take to prevent significant impacts to ungulate populations.

In the Draft EIS, the Service and NPS found that "there would be a small increased incidence of grizzly predation on ungulates during the primary phase of establishing an initial population of 25 grizzly bears. After 60 to 100 years, with a population of 200 grizzly bears, ungulate predation could be proportionally greater but is not expected to have significant population-wide impacts."² Although the Service acknowledges the potential impact of the proposed introduction of grizzly bears on ungulate populations, the proposed rule fails to include a provision that allows the State to effectively manage this and to protect the health of these populations. The 10(j) rule should allow intentional take to prevent significant impacts to ungulate populations.³ This authorization is necessary to give State and Tribal authorities the ability to manage the reintroduced grizzlies. The Service has done so when introducing nonessential experimental populations of other predator species, like Mexican wolf.⁴

When the NEP establishes itself, it will likely reduce Washington's deer, elk, and other wildlife populations. In general, grizzly bears consume the most meat in late spring when ungulate calves (mule deer, black-tailed deer, elk, moose) are available.⁵ A healthy bear population preying on calves increases the risk of substantial population decline, at a time when Washington's mule deer, black-tailed deer, and elk numbers have not been consistently expanding but have fluctuated.⁶ The State must have the ability through lethal control to protect these populations from declines or negative pressures caused by grizzly bears.

Further, reduced ungulate populations as a result of grizzly predation will have significant economic impacts for Washington. Hunting and wildlife viewing are economic drivers in the State. As one example, hunting and fishing accounts for 25% of visitor use in the Okanogan-Wenatchee National Forest, which is within the NCE and within the proposed NCE Recovery Zone.⁷ Game species in this area that could be affected by grizzly bears include: deer, elk, bighorn sheep, and moose.⁸ Reduced huntable populations mean fewer tags, fewer hunters, and less income for individuals who make their living from guiding hunts. A reduction in hunting tags and hunting licenses would also result in a loss of revenue for the WDFW's wildlife and habitat management programs. Thus, the 10(j) rule should ensure that the State has flexibility to protect ungulate (and other wildlife) populations from excessive impacts caused by grizzlies. For these reasons, SCI supports inclusion of a provision that would allow the Service, or its designee, to take grizzly bears if wild ungulate populations decline below established State or Tribal management objectives due in part to grizzly predation.

b. The 10(j) rule should allow grizzly bear hunting when authorized by State and Tribal authorities.

Finally, to provide full management flexibility for State and Tribal authorities, the 10(j) rule should authorize grizzly bear hunting when those authorities implement a grizzly hunting season, even if Washington's grizzlies are still listed under the ESA. Indeed, allowing grizzly bear hunting in such a situation is consistent with the ESA's definition of "conservation," which recognizes that regulated hunting may be used to manage abundant populations of a listed species.⁹ The Service should ensure that the State has sufficient flexibility to properly manage an abundant grizzly bear

population.

The NEP area should include neighboring states where grizzly bears remain listed under the ESA.

The increased flexibility discussed above should not be limited to Washington State but should extend to other States and Tribes that will likely be affected if the introduced grizzly population expands to or exceeds 200 bears. Grizzly bears released in the NCE will quite possibly disperse from reintroduction sites to other areas, including neighboring states and British Columbia. The proposed rule attempts to delineate Management Zones throughout Washington, each with its own level of management allowed under the 10(j) rule.

The Service failed to include neighboring states in the proposed NEP area and associated Management Zones. The Service considered the possibility that the grizzly bears may relocate but wrote the idea off after evaluating “the opportunities for grizzly bears to move between blocks of high-quality grizzly bear habitat in Washington ...; the potential for human-bear conflicts; grizzly movement data from other populations; the location of the closest existing grizzly bear populations and historical observations of dispersers from those populations; ease of implementation ...; and input from NPS, WDFW, [the Service], and the public.”¹⁰ That is short-sighted for several reasons.

First, the Service expressed concerns that grizzly bears introduced into British Columbia would cross international borders into the NCE.¹¹ Under this same logic, it is equally likely the introduced grizzlies will cross the border into Canada, and into nearby states. Grizzly bears will naturally disperse from demographic home ranges as the carrying capacity of that area is reached and exceeded. If the NCE introduction succeeds, it will ultimately result in bears outside the geographic boundaries described in the rule. The Service should include neighboring states, and treat grizzly bears found there as part of the NEP. Specifically, the adjacent parts of nearby states in which grizzly bears remain listed under the ESA should be included in the NEP; specifically, Idaho and Oregon. Accordingly, the Service should significantly enlarge the designated NEP area to include areas where the grizzly bears might disperse.

Additionally, the Service should commit to returning grizzly bears that leave the NCE back to the NEP area. Relocated bears (and other animals) have a greater tendency to travel long distances in an attempt to return to their original home ranges. It is inevitable that bears are going to leave or try to leave the NEP area. The proposed rule should empower Washington State, and the wildlife agencies of neighboring States, to capture and return or facilitate the return of grizzly bears from the NEP.¹² At a minimum, the 10(j) rule should more clearly explain what each agency (or agencies) will do in the event that a reintroduced grizzly bear leaves the State.

Accidental harvest of grizzly bears due to mistaken identification while hunting should not be referred for prosecution, per the “McKittrick Policy.”

The proposed rule states that “the act of taking a grizzly bear that is wrongfully identified as another species is not considered incidental take and may be referred to appropriate authorities for prosecution.”¹³ This statement contradicts the Department of Justice’s “McKittrick Policy” as affirmed by the Ninth Circuit Court of Appeals and should be removed from the 10(j) rule. The McKittrick Policy provides that incidental shooting of a listed species due to mistaken identity does not violate the ESA’s take prohibition because the shooter does not knowingly violate the law. Thus, criminal prosecution in such instances is not appropriate.

The McKittrick Policy was previously challenged in a suit involving accidental incidental take by hunters who mistake Mexican wolves for coyotes while lawfully coyote hunting. The district court and Ninth Circuit Court of Appeals rejected this challenge and concluded that the policy is consistent with the intent and language of the ESA.¹⁴ The McKittrick policy should apply to incidental take when a grizzly bear is mistaken for a black bear during a legal black bear hunt as well.

To be clear, SCI does not condone intentional illegal harvest of grizzly bears or any other species, and the Service should refer for prosecution any such take that is not truly accidental. But as the Service has recognized, in rare cases, it is possible to mistakenly identify grizzly bears as black bears. Black bear hunters provide a valuable service to the State by helping maintain the black bear population within State population objectives. The reintroduction of grizzly bears in the NCE, and the Service’s 10(j) rule, should not deter hunters from black bear hunting. It is also important to note that in 2018, the WDFW began to require black bear hunters to take and pass a bear identification test when hunting black bears in specific areas

within grizzly recovery areas, with the intent of minimizing the potential for accidental killings of grizzlies because of mistaken identification. SCI expects that the WDFW would expand the areas for which this test is required, if grizzly bears are reintroduced into the NCE, and pledges to work with the WDFW to achieve this.

The 10(j) rule should include an "escape clause";

The Service should include an "escape clause" that authorizes the State to lethally remove all members of the experimental population if its "nonessential" status is at risk. The Service has included such escape clauses in numerous other experimental population rules.^{*15} The Service is well aware that certain organizations routinely challenge the "nonessential" designation of experimental populations and should draft the proposed rule to account for this risk.

An escape clause is proper, given that the NCE grizzly bear population is not necessary for the continued existence of the species, and removal of the population would not impact the status of grizzly bears throughout the lower 48 states.^{*16} The Service should confirm that this experimental population is nonessential. An "essential" experimental population is one "whose loss would appreciably reduce the likelihood of success of the species' survival in the wild."^{*17} The loss of newly released grizzlies in the NCE would not appreciably reduce the likelihood of the species' survival, because that loss would have no effect on the survival of the lower 48 states grizzly bear population. Grizzly populations in the Northern Continental Divide and Greater Yellowstone Ecosystems are healthy and expanding--to the point that the Service has delisted or is considering delisting these populations. There are also healthy grizzly populations in Alaska and Canada. Accordingly, the experimental population of grizzly bears is nonessential.

Failure to include such an escape clause is inconsistent with the intent of the ESA, as well as arbitrary and capricious. Congress made clear that only in rare cases should an experimental population be designated as "essential."^{*18} This choice was intended to "allow[] for management flexibility" and "encourage cooperation" with States and other stakeholders.^{*19} The Service has honored Congress' intent repeatedly when designating other reintroduced experimental populations as nonessential.^{*20} The Service should reinforce its commitment to following the direction of Congress by incorporating an escape clause in the event litigation forces the redesignation of the NEP.

Conclusion

Thank you again for the opportunity to comment on the proposed rule and Draft EIS. If you have any questions, please contact Madeline Demaske, SCI Litigation Associate, at litigation@safariclub.org.

Sincerely,

President, Safari Club International
501 2nd Street NE
Washington, DC 20002

^{*2} Draft EIS at vi.

^{*3} The Service should also consider allowing intentional take to prevent unacceptable impacts to other game species, including coyote, racoon, rabbit, hare, and wild turkey, not just ungulates.

^{*4} 85 Fed. Reg. 20967 (Apr. 15, 2020).

^{*5} Draft EIS at 73.

^{*6} Mule deer and black-tailed deer numbers have declined since the historical highs in the mid-20th century but are now growing slowly. In 2021, the North Cascades elk herd has an estimated population of 4,128 to 4,203, a decline from the approximately 6,000 in 2014 and 2015. *Id.* at 73-74.

^{*7} The WDFW issues hunting permits for the Mt. Baker-Snoqualmie National Forest, the Okanogan-Wenatchee National

Forest, the Lake Chelan Recreational Area, the Ross Lake Recreational Area, and several game management units within the NCE. Id. at 102, 115.

*8 Draft EIS at 115.

*9 See 16 U.S.C. § 1532(3) (defining “conservation” to include “the use of all methods and procedures which are necessary to bring any endangered species or threatened species to the point at which the measures provided pursuant to this Act are no longer necessary,” which, “in the extraordinary case where population pressures within a given ecosystem cannot be otherwise relieved, may include regulated taking”).

*10 88 Fed. Reg. 67193, 67201 (Sept. 29, 2023) (“Proposed Rule”).

*11 The Service expressed these concerns at their virtual public meeting on October 17, 2023. The meeting was recorded and can be found at https://www.youtube.com/watch?v=G4HLymX_xU0.

*12 A return clause of sorts was included in the 10(j) rule for the nonessential experimental population of grizzlies in the Bitterroot Ecosystem. 50 C.F.R. § 17.84(l). Such a return clause was also included in the recent 10(j) rule for gray wolves in Colorado. 88 Fed. Reg. 77014 (Nov. 8, 2023).

*13 50 C.F.R. § 17.84(y)(3)(iii)(C) (proposed rule).

*14 *WildEarth Guardians v. U.S. Dep’t of Justice*, No. 17-16677, 752 Fed. Appx. 421 (9th Cir. 2018).

*15 The Service routinely includes such clauses in experimental population rules. E.g., 50 C.F.R. § 17.84(j) (including “escape clause” in rule establishing nonessential experimental populations of California condors); 50 C.F.R. § 17.84(x) (including “escape clause” in rule establishing nonessential experimental populations of wood bison in Alaska); 59 Fed. Reg. 60266 (Nov. 22, 1994) (rule establishing nonessential experimental population of the Rocky Mountain gray wolf).

*16 Currently, there are at least 1,913 grizzly bears in the lower 48 states (737 in the Greater Yellowstone Ecosystem, 1,068 in the Northern Continental Divide Ecosystem, 55-60 in the Cabinet-Yaak Ecosystem, and at least 53 in the U.S. portion of the Selkirk Ecosystem). In addition, grizzly bears have been verified in areas outside of current distributions. See the Services Environmental Conservation Online System (ECOS) species profile at <https://ecos.fws.gov/ecp/species/7642>.

*17 50 C.F.R. § 17.80.

*18 86 Fed. Reg. 59953, 59967 (Oct. 29, 2021) (“[O]ur finding of whether a population is essential is also made with our understanding that Congress enacted the provisions of the ESA’s section 10(j) to mitigate fears that reestablishing populations of endangered or threatened species into the wild would negatively impact landowners and other private parties. Congress recognized that flexible rules could encourage recovery partners to actively assist in the reestablishment and hosting of such populations on their lands (H.R. Conference Report No. 97-567, at 8 (1982)).”).

*19 63 Fed. Reg. 1752, 1755 (Jan. 12, 1998) (establishing the nonessential experimental population of Mexican wolf); 49 Fed. Reg. 33885, 33888 (Aug. 27, 1984).

*20 E.g., 71 Fed. Reg. 42298 (July 26, 2006) (Northern Aplomado falcons); 61 Fed. Reg. 54044 (Oct. 16, 1996) (California condors); 56 Fed. Reg. 41473 (Aug. 21, 1991) (black-footed ferrets); 51 Fed. Reg. 41790 (Nov. 19, 1986) (red wolves).

Correspondence: When I asked a ranger in a Ranger Station what was the purpose of introducing Grizzly Bears in the North Cascades National Park, the answer was that the Grizzly Bear used to be in this area 1000 years ago.

Is that a good and sufficient reason? Many things have changed since the Grizzly Bear was around the Cascades, re-introducing it will create a great impact in the area, especially for hikers.

Bears will not be in the higher lands as they say, Melting glaciers, devastated forests, fires, will cause animals to move to lower areas closer to where hikers like me go to enjoy nature. Many of us don't carry guns, neither would like to harm an animal. Carrying bear spray would provide some but not enough comfort. What is the purpose really? If I want the emotion of possibly encountering a grizzly bear, I can go to Yellowstone, Montana, Alaska... Please leave the North Cascades as they are now. Thank you.

Correspondence: I am writing in support of the reintroduction of grizzly bears to the North Cascades ecosystem, and in particular I support this reintroduction under one of the action plans.

As a volunteer at Woodland Park Zoo, where I talk to zoo guests about animals and conservation efforts in our state and around the world, and as a graduate of Miami University's Project Dragonfly master's degree program in conservation biology, I am aware of the importance of a balanced and healthy ecosystem. Grizzly bears were an important part of this ecosystem until humans hunted them to near extinction in our state. We cannot erase our past mistakes or those of our ancestors, but we should do everything in our power to improve the natural environment for ourselves and our descendants. The management plan for the reintroduction is based on science and is informed by reintroduction projects in other areas of the country. This knowledge can help the grizzly bear species thrive in the environment, help the ecosystem recover, and help people understand how they can and why they should co-exist with wildlife.

Woodland Park Zoo and other organizations help educate people about conservation issues and how humans and wildlife can live together. The zoo, and its staff and volunteers, will continue to share these messages on a daily basis, thereby supporting the importance of the reintroduction process. My Washington has grizzly bears! Please bring them back!

P.S. I'm a huge fan of the NPS and one of my bucket-list goals is to go to all of the National Parks and as many NPS properties as possible. The parks make history, nature, and science far more interesting than any classroom! Keep up the good work!

Sincerely,

Everett, Washington

Correspondence: Given how terrible the "Restoration" of the grizzly bear population has made life for my family in Montana, I absolutely do NOT believe we should pursue anything of the kind.

I feel grizzly bears are very misunderstood to be similar to black bears. It is important to know they are not. We have not succeeded at introducing them near people, so doing so is effectively the same as killing people, pets, and livestock. Until

they have been successfully reintroduced to Yosemite national Park and the Sierra Nevada mountains, I don't believe we have the capability to safely and successfully reintroduce them anywhere else.

Please don't murder people for the sake of further messing with a barely stable ecosystem, especially since we've proven we don't know what we're doing in this regard.

Correspondence: The central Cascade range area of Leavenworth, WA experiences nuisance black bears & cougar mountain lions that result in wildlife being euthanized at an average of 1 black bears & 3 black bears cubs, & 1 cougar mom & 2 cougar cubs annually. This nuisance wildlife is caused by a lack of proper trash management usually. County Waste Management will not allow residents to secure trash or use bear trashcans, leading to nuisance wildlife. The success of grizzly bears being introduced will only be as great as preventive measures, including waste management allowances to residents in the Cascades bordering national forest land. Re-introducing grizzlies to the Cascades can only happen if considerations are taken by people who lives within wildlife's large territories.

Correspondence: I am personally against the reintroduction of grizzly bears at this time. I was in incredibly close proximity to the grizzly (about 30 yards) that was removed from the Onion Creek area. I witnessed the devastation on livestock and infrastructure that this grizzly caused. I bring this up not to cast Grizzly bears as the "bad guy" (they are a magnificent animal that belongs on the landscape), but to illustrate a few things that are worth considering.

First, grizzlies are already moving into Washington State on their own. Why accelerate a process that we can allow to occur more naturally when we do not know the full effects of this reintroduction on other affected species such as black bears? Given the recent decision by the Fish and Wildlife commission to close the Spring Black Bear Season to protect black bears, it seems marginally insane to introduce a species that will push them off their territories.

Second, conflicts are already beginning to occur because grizzlies are moving into the marginal habitat that is occupied by rural citizens of the state. If the habitat was bursting with resources, we would likely not have grizzly bears showing up to raid trash cans and chicken coops each year.

Third, there is not a solid plan for conflict resolution. The Onion Creek grizzly was only relocated 30 miles. When I spoke to the officer doing the relocation (Jeff Flood), he said that was "a quick walk for a grizzly". This bear has learned that he can break into buildings to get food. That does represent a public health hazard. Do we have to wait till he breaks into a building that happens to be occupied by people before we remove this bear from the population? If we are going to introduce grizzlies to the landscape, we need clear and reasonable guidelines for conflict resolution. Those guidelines and procedures are going to take time to implement, time you short yourself by doing an unnatural introduction.

Fourth, grizzlies will be introduced in the areas where rural citizens have less of a say in the matter while being most affected by the decision. Walk around a rural area and ask folks if they want grizzlies to be reintroduced and the likely consensus you will hear is "no", walk around in a major metropolitan area and the consensus will likely be "yes". The difference is that the grizzly will be dropped in our forest, our back yard. Not theirs. For them it's a symbol of the wild, for us it is a living breathing reality. One that comes with complex problems.

Again, I want to be clear. I do not think that grizzlies are the bad guy. They are a feature of the American landscape that absolutely should exist and be protected (like every other species we find ourselves fortunate to still have), but we have a political environment in Washington at this time that lacks the structure, desire, science or the confidence of the public to do so without disastrous consequences.

Without sound science on how this introduction will affect all other species in the ecosystem, it is a violation of the both the precautionary, and best available science principles that the Fish and Wildlife Commission say they believe in. Instead of applying these concepts correctly, they spin them into pro-predator, anti-hunting policy. That is part of the fractured confidence in governance I mentioned earlier.

In short, the people who have to deal with the consequences are having this situation dictated to them from afar, by a government they feel disaffected by for completely understandable reasons. When you measure the cost of that as well as the inevitable damage that will occur by the rapid reintroduction of an apex predator, that would move in on their own anyway, I have a difficult time understanding what benefit could possibly encourage someone to engage in this folly. It is a losing gamble for everyone involved, including the bears.

Correspondence: I support restoring grizzly bears to the North Cascades. Grizzlies lived in this area for thousands of years. They are a keystone species. They belong here. God created them. They are Sacred. There used to be 50000 to 100000 grizzlies in the west. Now only 10 remain in the North Cascades -- a prime grizzly habitat!

I do not support 10(j) experimental designation, although some do. Based on what has happened with other 10(j) designations, once given it is never taken back. 10(j) gives flexibility? Really? to whom? To farmers & ranchers that want to kill bears and other endangered species? To make it palatable to the very people who do not want bears or any other wildlife? For people that want to expend no effort in coexistence strategies?

I live in a state with wolves, bears, mountain lions, bobcats and other wildlife. People must learn to coexist with wildlife and to stop stealing & developing their habitat. People must learn not to be be turons or just plain morons. Most importantly, people need rules & regulations to control THEIR behaviors.

Introducing a few grizzly bears per year is reasonable to me. Female bears have their first cubs at 6 years old and raise the cub for another several years. So a loss one one bear has real impacts to the grizzlies.

I have an advanced academic degree but not in ethology. I have read widely on wildlife in general and bears. I am currently reading What the Bears Know by Steve Searles & Down from the Mountain by Bryce Andrews. You the NPS are aware of all the scientific studies, researchers and organizations that support grizzlies so I do not need to repeat this knowledge & science to you. I stand with the Grizzly Treaty supported by hundreds of tribes.

I love bears. My pup is named Bear. Bears represent: Strength. Courage. Independence. Family (as seen on all those Mama Bear t-shirts).

Again as a US citizen and taxpayer I support restoration of Grizzlies in the North Cascade. And I am against what Rep Dan Newhouse stands for: misinformation regarding grizzlies.

"Earth and sky, woods and fields, lakes and rivers, the mountain and the sea, are excellent schoolmasters, and teach some of us more than we can ever learn from books." - William Wordsworth, poet

Thank you for your consideration.

Correspondence: I am commenting in favor of the overall plan to restore grizzly bears to the North Cascades Ecosystem. Restoring grizzly bears to this ecosystem will restore a species that has historically been an important part of the ecosystem and support a more robust and healthy ecosystem due to their presence. There is also value to humans in knowing that these creatures that were long a part of the ecosystem here have been returned after being extirpated by past human activity. It's both environmentally sound and ethically appropriate to return the bears.

Re: Comments regarding North Cascades Ecosystem Grizzly Bear Restoration Plan/Environmental Impact Statement and Establishment of a Nonessential Experimental Population of Grizzly Bear in the North Cascades Ecosystem

INTRODUCTION

Wildlands Network respectfully submits these comments to the National Park Service ("NPS") and the U.S. Fish and Wildlife Service ("FWS") (collectively, "the agencies") to positively impact the development of the North Cascades Ecosystem Grizzly Bear Restoration Plan/Environmental Impact Statement ("plan/EIS") and the proposed rule establishing a nonessential experimental population ("NEP") of grizzly bear in the North Cascades Ecosystem ("NCE") ("Draft 10(j) Rule").

Wildlands Network applauds the agencies decision to develop a plan/EIS to restore the grizzly bear to the NCE and the FWS Draft 10(j) Rule to establish a NEP of grizzly bear within the NCE as these efforts closely align with our organization's mission statement to "reconnect, restore, and rewild North America so that life - in all its diversity - can thrive." We encourage the agencies to proceed with the publication of a Final 10(j) Rule, the publication of a Record of Decision, and the implementation of a final North Cascades Ecosystem Grizzly Bear Restoration Plan.

The following comments are organized into two parts. First, we explain why we recommend the agencies work towards addressing and mitigating issues related connectivity when working to reintroduce grizzly bears in the NCE. Second, we provide some comments on the Draft Environmental Impact Statement (DEIS) and Draft 10(j) Rule.

DISCUSSION

1. Grizzly Bears and Habitat Connectivity

Wildlands Network recommends the agencies work towards addressing and mitigating issues related to connectivity when working to reintroduce grizzly bears in the NCE. By way of background, in November 2012, Dr. William Gaines wrote the following while working on the Northeast Washington Forest Plan Revision Team:

"Habitat connectivity is a measure of the ability of organisms to move among separated patches of suitable habitat, and is important for providing the long-term viability of populations and for allowing species to respond to changing climate. Animals need to be able to move efficiently within their home ranges to access food, shelter, mates, and other basic needs. In addition, animals need to move beyond their home ranges to find unoccupied habitat and maintain genetic exchange between groups."

"Approaches to providing habitat connectivity have focused on two concepts: corridors and permeability. A corridor is defined as any space, usually linear in shape, which improves the ability of organisms to move among patches of their habitat. Permeability is defined as the quality of a heterogeneous land area to provide for the passage of animals. Permeability provides a broader measure of resistance to animal movement and gives a consistent estimate of the relative potential for animal passage across entire landscapes."

Issues of habitat connectivity and genetic exchange are particularly relevant to grizzly bears because the genetic isolation and lack of connectivity between existing grizzly populations was a recognized threat at the time of original listing and was cited by the FWS a reason for listing grizzly bears on the Endangered Species List ("ESA"). Another reason the FWS cited when listing grizzly bears was the "increasing detrimental pressures" exerted on grizzlies by humans visiting and working in areas occupied by grizzlies. Some of these "detrimental pressures" are activities that emanate from roads and railways which inhibit animal movement. Both of these factors - genetic isolation and resistance to animal movement" - are connectivity-related issues. Because the purpose of the ESA is to "provide a means whereby the ecosystems upon which endangered and threatened species may be conserved" and because the FWS must make listing and delisting determinations according to the same analysis, we recommend the agencies work towards addressing and mitigating issues related connectivity when working to reintroduce grizzly bears in the NCE.

Addressing connectivity outside the NCE would require working to improve habitat connectivity and reducing resistance to animal movement between the NCE and the nearest grizzly bear populations in Canada and the Selkirk Recovery Zone. We were encouraged to see the recognition of this issue in the Draft 10(j) Rule and in Section 2.b we recommend taking some additional steps.

Addressing connectivity within the NCE would also require working to improve habitat connectivity within the NCE and finding ways to limit mortality specifically caused by roadways and railways. Roads and railways can fragment habitat and serve as a barrier to grizzly movement. Recent studies have highlighted how sensitive grizzlies are, as a species, to habitat fragmentation, especially females. In one striking example from Southern British Columbia, no known female grizzly bears crossed a roadway frequently crossed by male grizzly bears. If a goal of the Recovery of Grizzly Bears in the North Cascades is to have "reproducing bears ... distributed throughout the recovery area," we believe it will be essential to ensure female bears are willing to move throughout the NCE with as little resistance to movement as possible. Furthermore, as mentioned previously, roadways and railways are also the site of collisions between grizzlies and vehicles and trains, which present a danger to drivers, operators, and grizzlies alike. We recommend ways to improve habitat connectivity and limit mortality in more detail in Section 2.a.

2. Wildlands Network comments on the DEIS and the Draft 10(j) Rule

a. Wildlands Network comments on the DEIS

Wildlands Network supports the agencies decision to select Alternative C (Restoration with Endangered Species Action Section 10(j) Designation). Although we would have preferred the agencies select Alternative B (Restoration with Existing Endangered Species Act Protections), we understand the decision that Alternative C provides the agencies with greater management flexibility should conflict situations arise. We are hopeful though, that with an effective outreach, education, and sanitation strategy, the incidence of conflict situations will be minimized, and both populations of grizzlies and humans can thrive within the NCE.

One issue we believe warrants further discussion in the plan/EIS is the effects of WVCs that may result from the implementation of grizzly bear recovery in the NCE and ways to mitigate these effects. Draft plan/EIS Chapter 3 describes human activity in the region, including a description of the region's population, tourism, and industry and analyzes how grizzly bear reintroduction could impact human activity. Missing from this discussion is an analysis of the effects of WVCs on persons operating or inside vehicles, trains, and the bears themselves, and ways to mitigate these effects. The Washington State Department of Transportation collects data on WVCs and from 2015-2022 has recorded 9 reported impacts involving black bear along the two roadways bisecting the within the NCE. (See Appendix 1). Unfortunately, this figure is likely much higher in reality, as multiple studies conclude that half or two-thirds of large mammal WVCs go unreported. Concerningly, all three potential release areas are located alongside one of these roadways, which has several documented instances of black bear WVC. Moreover, Burlington Northern Santa Fe ("BNSF") operates a railway that bisects the NCE, and recent studies

have indicated railways are a cause of WVC incidents, which are often not recorded.

In 2023, there have unfortunately been many reported instances of grizzly bear WVC in Canada and the United States. Fortunately, properly sited wildlife crossings, exclusionary fencing, and other measures can mitigate these harms and improve connectivity. The Draft 10(j) rule does discuss the issue of WVC marginally more than the DEIS and noting that "road access to grizzly bear habitat likely poses the most imminent current threat to grizzly bears by...increasing mortality of individual bears through vehicle strikes," while writing later that "accidental mortality caused by vehicle collision is difficult to control but is not anticipated to be a significant cause of mortality." Wildlands Network believes that because the anticipated reintroduction population is so low for so long, any WVC strike will be a significant cause of mortality for grizzlies, appreciably impact the restoration timeline, and also a significant danger to drivers and passengers. For this reason, we recommend additional analysis on the topic (both rail and road) and ways to mitigate the issue in the plan/EIS.

b. Wildlands Network comments on the Draft 10(j) Rule

Wildlands Network applauds the agency's decision to designate Management Zone 2 both east and south of the NCE, and we are hopeful that in the future, the reintroduced grizzly bear population will move into these habitats and reconnect with adjoining populations. To facilitate that potential, we recommend the agencies explore an expansion of the "no net loss of core area" approach for grizzly bear habitat to all Zone 2 designated lands. Management Zone 1 lands are the "primary area for the experimental population restoration and [also] serve as core habitat for survival, reproduction, and dispersal of the NEP." The agencies expect grizzly bears to transient and occupy Management Zone 2 land. Yet, for grizzly bears to use Management Zone 2 lands successfully, these lands must be managed in a manner that facilitates transience and occupation because female dispersing bears do not travel far at any time, so any population using that land, especially the Zone 2 land east of the NCE, would likely be expected to stay for some time.

CONCLUSION

We appreciate the opportunity to submit comments to positively impact the development of the plan/EIS and the Draft 10(j) Rule. Please do not hesitate to contact us if you have questions or comments.

Sincerely,

[Redacted signature block]

Correspondence: I feel the reintroduction of Bears to the N cascades is a needed step in the repair of the ecosystem that goes hand in hand with the reintroduction of the wolves and of the Mt Goat relocation from the Olympic national park.

These animals all hold an important role in balancing the ecosystem.

The north cascades are uniquely situated and isolated from large human populations and the humans that venture there just need to be educated on the bears and the safely being in thier environment as well as why they are important to be there.

thanks for revisiting this important issue, our children and grandchildren will thank you as well.

Correspondence: I strongly disagree with this proposal. Why is this needed, there does not seem to be any pertinent reason aside from the endangered species status. We have big carnivores in WA (Black Bears and Cougars) already and unless there's a critical environmental imbalance I don't think this would have a good justification.

Our parks are very populated, we are not Alaska and grizzly bears are an aggressive species.

Correspondence: The North Cascades is one of six ecosystems where grizzly bear recovery is possible. The region is large enough to support a viable population, and contains enough public land to provide more than adequate habitat. As a member of the public and someone who appreciates our National Parks for the opportunity they bring to experience an intact ecosystem with native species, including top level carnivores, I support the efforts to reintroduce grizzly bears through transplantation/augmentation. I believe others would like to see grizzly bears reintroduced to the North Cascades, and that the Park's visitation will increase after the reintroduction also benefitting local economies. Importantly, this effort appears to have the support of the Okanagan Nation Alliance.

Grizzly bears are a keystone species and through predation, scavenging, and ground disturbance they shape the landscape and enhance biodiversity. The restoration of this population would benefit the Park's ecosystem, and would be a large step forward in species' recovery.

Once repopulated, would the acquisition of additional habitat, including easements on private land, potentially provide linkage to the Selkirk and Cabinet-Yaak populations to provide genetic exchange among these small isolated populations? If so, this would be an added benefit of the restoration efforts. Protecting habitat for grizzly bears also ensures habitat for a plethora of other species.

Due to rapid human population growth and conversion of land into houses and subdivisions there are few places left where the grizzly bear can flourish. This lends an urgency to protect grizzly bears throughout their range, and to aggressively begin recovery efforts whenever and wherever possible. We must not squander the opportunity to reintroduce bears into the North Cascades.

I live in the Cabinet Mountains of northwestern Montana, and, sadly, I have witnessed the small isolated population of grizzly bears dwindle due to human-caused mortality. While there is a fair amount of public land, the bears may never do very well here without active management due to two proposed large-scale mines, two highways (2 and 200), and a growing human population. While there is a national wilderness area (Cabinet Mountains Wilderness), there is no national park to provide added protection from hunting and poaching. Local recovery efforts include a bear management specialist to reduce conflicts, public education, land acquisition for travel corridors, and augmentation of the population.

There is a segment of the population that would either like to sterilize everything, or would like to hunt everything. Neither segment understands the important role predators play, and should not disproportionately influence efforts for reintroduction or species management.

In closing, I support Alternative C: Restoration with Section 10(j) Designation.

Correspondence: Myths:

#1. Bears reintroduction will benefit the ecosystem.

But how exactly? Nobody can properly articulate. Is it by eating deer or salmon that is already at dangerously low levels?

#2. Bears were here before us, and deserve their place in our state.

False. Why don't we reintroduce dinosaurs? Not everything needs to be reintroduced just because somebody said so.

#3. Don't worry. Probability of being attacked by the bear is extremely low.

False. Probabilities are measured against the average population. Average population doesn't go hiking and not into remote locations. If it were calculated properly for avid hikers, numbers would tell a different story. If you disagree, the state should proactively communicate funding in case of bear attacks leading to death. It's only fair because those in power choose to impose this danger on others.

Facts:

#1. Bears reintroduction protagonists do not live in the areas affected, and will not even venture there for hiking. Local communities are clearly against it.

#2. "Grizzly and black bears can severely maul or kill you. They are unpredictable and will defend themselves, their young, their food, and their territory. When surprised, they may react by attacking. ALL bears are potentially dangerous." See npshistory.com (Denali park). Obviously, consequences for grizzly attacks are much worse compared to black bears. And that's why local people in Alaska always carry guns, high caliber. Do we want that for Washington state? I would hope not.

Thanks for reading.

Correspondence: I do not support the idea of reintroducing grizzly bears to the North Cascades National Park. It will eliminate this park as a potential destination by numerous people due to Fear.

I do not consider myself that fearful of wildlife. I have recently taken up backpacking and have made several trips in black

bear country without carrying bear spray.

I am also well aware that the likelihood of being killed or injured by a grizzly bear is lower than that of driving to the park, being struck by lightning in the park, etc. Heck, tripping and hitting your head against a rock is far more likely than a grizzly bear attack. So yes, it is mostly irrational fear.

However, my wife and kids? They're terrified of bears. My wife struggles to sleep in a tent in black bear country. She will absolutely not visit the North Cascades backcountry if grizzly bears are reintroduced. And frankly I would be disinclined to do so as well without packing a firearm (even though we all know the advice that bear spray is considered more effective than a firearm).

Now let's discuss how irrational the fear really is. While the probability of being attacked is extremely low, the problem is that I cannot think of a worse way to die than being eaten by a grizzly. Hence fear, irrational fear, perhaps with some rationality if you consider "eliminating the worst ways to die" aspects.

Just consider the most recent incident in Canada's Banff National Park where an old grizzly bear (with bad teeth) attacked and killed an very experienced couple. However the terrifying part is that it was clearly a long, drawn out attack. Why do we know this? Because one of them was able to fire off a Garmin Inreach message saying "Bear attack. bad". A Garmin Inreach satellite navigator has 4 buttons. It is slow to poke out a text message. What surely happened was that one of them was being mauled for dozens of seconds (or minutes) while the other typed out a message and then eventually got mauled and partially eaten as well. Ultimately both were found dead with empty canisters of bear spray.

It may take 20+ years for a similar incident to occur in the North Cascades. But at some point, such an incident will occur and it will be the worst nightmare of anyone contemplating visiting a U.S. National Park.

In summary, reintroducing grizzly bears to the North Cascades will do the following:

- * eliminate the park as a backpacking and hiking destination for many due to fear
- * cause more guns to be carried into U.S. National Parks (even though discharging them is illegal).

Bio Vitae _ I am 74 years old and have lived in Western Washington for 73 of those years. I worked for forebearers of and the current Washington Department of Fish and Wildlife for 35 years in both its Fish and Wildlife Programs. Since retiring I have volunteered over the past 14 years for the U.S. Forest Service's Mount Baker Ranger District performing hand road maintenance as well as fish and wildlife monitoring work. It is my conviction that the public is well served by the Forest Service's mission of providing citizens and visitors with broad but reasonable and well-maintained access to forest lands to engage in a variety activities and benefit from immersion in this wonderful, natural wilderness environment. This should be protected and perpetuated.

Comments Regarding

Draft Grizzly Bear Plan / Environmental Impact Statement, North Cascades Ecosystem

1. Basis for Habitat Suitability Justification _ The fundamental assertion that lands of the greater North Cascades Range of Washington State are qualitatively able to support a viable brown bear population is supported by citations of assessments, studies and evaluations made throughout the history of the NCE that are reasonably well footnoted for reference. But I am unable to find reasonable abstracts describing in some detail the various methodologies and their premises that led to that conclusion. I think those summaries need to be elucidated in the EIS so the scientists outside the proponent fraternity as well

as the citizens likely to be directly affected by the project and the general public can read and judge for themselves the legitimacy, objectivity and veracity of the scientific methods used to collect, compare and evaluate data. Some of the citations for analyses date back to the early 1990s when GIS modelling and digital spectrographic data collection including lidar technologies were in early development from their genesis. Abstracts should include discussion of the role of comparing and contrasting analytical modes _ similarities and differences _ in habitat quality and animal demonstrated selective tendencies evaluation. Often in science is asked to use datasets that are older, non-randomly gathered, or are sparsely populated characteristics that can bias evaluative results.

Example: researchers compared the natural plant and animal forage base lists from donor population locales with that of the NCE flora and fauna and found a considerable correlation of listed herbaceous plants, fungi, insects as well as large and small terrestrial animals that contribute to brown bear diets. But I could not find reference to relative abundance or distribution of each food element within the NCE which are equally critical characteristics.

Example: I would like to see a comparison of the micro-connectivity of habitat in the NCE by elevation and slope, something similar to the USGS StreamStats model which incorporates at least seven different variables (surface area, elevation range, slope aspect, slope angle timbered versus bare, etc.) to estimate incremental stream run-off volumes for engineers. The ease (conserving energy, etc.) with which animals, especially terrestrials and sparsely abundant ones, can move around to find and take in food, seek shelter and reproduce goes straight to developing a bioenergetics model for these bears. Such a digital analytic model was developed for bald eagles to assess how much disturbance they could tolerate in the winter on salmon carrion rivers.

2. Need for Apex Omnivore Justification_ A second contention referred to somewhat obliquely in the EIS is that brown bears here in the era prior to European settlement, were likely the dominant animal. It is a given that their size relative played the major role, but the inherent complexity of ecosystems means that everything is play off against or in concert with many other both in the plant as well as animal kingdoms. From my observational experience and research of nearly 70 years, I have difficulty concluding that the bio-dynamics of the NCE are radically altered. Extirpation of the grizzly population occurred relatively speaking a short time ago, so there should be some of historic record that points to how the ecosystem functioned while they were here and how those dynamics or characteristics have changed with the start of their decline and then disappearance. I think it difficult to say as many proponents of grizzly restoration assert that the ecosystem will be back to well-oiled machine status with them back. Different, yes, better in terms establishment of efficient, stable dynamics that foster maximum diversity, no. I don't see hoary marmots, ravaging subalpine and alpine meadows because there are no grizzlies to dig them out.

Example: How numerous were ungulate (deer and elk) populations during the grizzly bear dominance and did they behave generally in the same manner they do now, migration in season vertically to utilize timberline meadow habitats.

Example: It is stated in the EIS that grizzlies are noted for playing a significant role in plant distribution via seed transference, however that is a dynamic fulfilled by a wide variety animal species from birds to ungulates and even pikas as well as weather conditions (mainly air currents, precipitation-prompted stream run-offs).

3. Lead and Cooperative Entities not on The Same Commitment and Capability Page _ Starting a project of this magnitude with agencies of government (at all levels federal state and local) with critical factors such as public safety and visitor management to minimize. Despite assurances from FWS that it will not unilaterally impose Endangered Species Act Section 4 rules as legal directives as long as the previous conditions are observed by the Forest Service and the State of Washington, that does not from a public safety and animal management standpoint mitigate the unintended effects of arbitrary and unpredictable behavior on the part of the any introduced animals placed on the ground inside the park or designated wilderness areas. It is my belief that is neither prudent nor logical to for the lead entities to move forward until the Forest Service and State of Washington logistically and legally are fully prepared for the eventualities of implementation of either Alts B or C. From and outside observer prospective, it does not look like a friendly thing to do to release an apex omnivore onto the landscape and it effect say, NOW, ready or not, deal with it.

4. Protection for ESA Listed Fish Species _ It is not clear the extent to which NOAA Fisheries and WDFW representatives consulted and settled on guidelines concerning impacts to ESA listed native salmon and steelhead stocks in the Nooksack and Skagit river basins by foraging bears that discover them? Further it is spelled out clearly what steps will be taken to avoid and/or mitigate impacts to previously federally listed native salmon, steelhead and native char in and adjacent to the NCE.

- In the North Fork Nooksack Basin _ beginning just 14 miles from the park's western boundary _ Thompson, Canyon, Deadhorse, Boyd and Glacier creeks all on USFS land and relatively small tributaries to the main river, annual are frequented by spawning spring chinook (summer for five weeks) and winter-run steelhead (spring for three months). Other less

intensively protected salmonids species are present, too.

- In the Skagit Basin, the upper Skagit, Cascade, Suiattle, Whitechuck and Sauk mainstems all host spawning salmon and winter-summer steelhead populations together with significant tributaries from Diobsud, Bacon, Goodell, Copper and Newhalem creeks in the Skagit above Marblemount to notable Suiattle tributaries including Tenas, Big, Buck, Downey, Slide, Lime, Sulphur.
- The North Fork Nooksack native chinook stock is managed as one of two discrete native, wild populations in WRIA 01. The Skagit basin currently has multiple recognized discrete chinook stocks that are monitored in recovery mode.
- Though not federally listed, the isolated Ross Lake rainbow trout population spawns in a number that reservoirs tributaries as well as in the main river in British Columbia each spring in numbers of fish that are of a stature (size) now that could attract grizzly bears. The population is sustained entirely by natural reproduction.

5. Inability to Assure Vital Follow Through _ This is patently acknowledged to be a long-term (forever) program with obligatory functions and follow-through asserted to be necessary, and perhaps even vitally so, to actively perform for years, if not decades out. And yet NPS and FWS practically speaking have no assurance of steady let alone increasing funding for personnel and materials beyond year one. Important tasks such as those related to public safety could be relegated to peripheral status or dropped entirely. As the recent history demonstrates, abrupt changes in executive direction and legislative intent will whipsaw abruptly change development, implementation and/or execution of public policy.

Both Alts B and C (especially extending into the adaptive management phase) will be labor intensive and that work force will have a large geographical area to covering in responding to various issues and events. I do not find in the EIS a prioritization doctrine discussion that would direct focus and deploy of staff on ongoing matters (scientific monitoring, conflict intervention, strategic planning) in the event of appropriation cuts. If out-year budgets are reduced for either of the two lead entities (FWS, NPS) or program cooperators USFS, WDFW, et al), serious dilemmas will arise such as whether to curtail conflict interventions and relocations in favor of scientific monitoring or continued transplantation.

In my 55 plus years of experience in field positions two government departments and three law enforcement agencies, I have seen countless initiatives, program's and projects abruptly and summarily downsized or abandoned altogether. Institutional continuity of mission and direction is vital and its interruption must carefully considered when a field agency plans and budgets for its operation.

6. Delegation of Authorities Discussion Legal Consequence _ this EIS states that no subrogations of authority are currently allowed by law so as to preclude direct or indirect private citizen management or enforcement participation in any way. Yet advocacy groups have vigorously pursued their protective initiatives and agendas in other ESA management efforts and this EIS acknowledges that is to likely continue in this endeavor. The troublesome nexus here is that the EIS states that this project has a range of potential criminal consequences for 'takes' under the ESA's Sec. 4. There is potential that highly motivated advocacy groups and individuals, through illicit surveillance on non-public lands, could bring allegations as complaining witnesses to the attention of FWS, with this EIS cited as formally excluding them as agents of and for government law enforcement and they could assert that they were free from the obligation to follow constitutional due process and evidentiary mandates all government commissioned law enforcement officers must follow.

7. Socio-Economic Impacts _ It is my view that the EIS does not address adequately the following:

- It under-estimates and seems to downplays rural economic impacts in general and especially to the current timber industry which has downsized dramatically for other pressures in the past 30 years. The cost of wood products, including construction materials, could go up in this locale if the current low level of contribution from the region's timber base is further eroded.
- There is a paradox inherent in the EIS in that in one section it states that there will be a dampening effect to the local economy in several sectors including tourism while in another part of the EIS it categorically states that the influx of tourists will increase benefiting rural service, hospitality and outdoors gear businesses due to people hearing of the grizzly's return and come here to see them. This sets up a further paradoxical element in the EIS which states that the placement territories selected at the outset will be as far as possible from proximity to humans and that mode of release will minimize greatest extent possible public contact during the staging of each year's re-introductions.

8. Contingent Public Safety Issue _ It is stated in the EIS that in potential British Columbia donor grizzly populations individual bears especially those in the Canadian Rocky Mountain spine areas are reported to be more aggressive in their approach to humans. It is a general premise that wildlife populations isolated from contact with homo sapiens lack aversion response to humans and are more approachable. It is not clearly and emphatically stated in the EIS what measures managers will employ to establish and maintain a safety zone around individual animals to preclude humans from getting too close and

triggering aggressive behavior.

9. Likelihood of Success of Alt C Action _ Puzzling in the EIS discussion of the expectation of success of these transplants is the assertion or assumption that this the NCE transplant recovery process will be successful. Cited in that discussion was an assessment of the history reintroductions in British Columbia in which it was found that 77 of 110 total transplants were determined to have failed mainly because the placed animals did not stay put within their anticipated new home territories, some even self-repatriated . A 70 percent failure rate over a broad enough sample would seem to indicate that this is not an effective or economic means to accomplish this objective. It comes to my recollection, that _ because of the then ban on direct releases below the 49th Parallel in Washington _ in the 1990s and early 2000s British Columbia Wildlife Branch captured grizzlies from around the province and released them into mountainous areas just north of the International Boundary and the U.S. portion of the NCE. These grizzlies were for the most part 'trouble' bears habituated to town garbage dumps and many of them made a bee-line back to those food sources. There is a considerable body of stories _ many documented _ of bear (grizzly, polar and black) self-repatriation after an imposed relocation often to get them away from the consequences of human close encounters.

It seems however that the optimistic presumption of success here is based on the hope that this is just too good of a place for these involuntary immigrants to leave. A project such as this should be based not on subjectively expected outcome but should be an objectively-derived procedure with the highest possible demonstrated success rate and the fewest unintended consequences.

Governments perpetuate not by force of will, but by the intuitive sense of justice they engender in the greatest body of a country's citizens.

Correspondence: I support the restoration of a healthy grizzly bear population in the North Cascades, which has been their home for thousands of years (or longer). As a keystone species, where grizzly bears thrive, so to does clean water and abundant native fish and wildlife populations. (Grizzly bears are ecologically and culturally significant and are vital to the overall health of the North Cascades ecosystem and its biodiversity. They are considered an indicator of ecosystem health.)

As such, I believe the best option to pursue is Alternative C: Restoration with Section 10(j) Designation. It is the best choice for the bears and for the people who live in and visit the North Cascades Ecosystem. The plan is wisely modeled on what worked in Montana, where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

While conflicts can cause emotional responses, when proactive measures are taken, it has been proven that people and grizzly bears can coexist and thrive. They do so in British Columbia, Montana, and Wyoming, where grizzly populations and back and front country recreation continue to grow hand in hand, providing a vital economic boost to the gateway communities in those areas.

Restoring grizzly bears as an "Experimental, non-essential" population under a well-crafted Section 10(j) rule of the Endangered Species Act makes sense. Such a designation will provide flexibility for wildlife managers to prevent and address human-bear conflict and a greater level of comfort for people who are concerned about the impacts of wildlife recovery on economic and recreation activities. Agencies have used the Section 10(j) Rule in the past to restore black-footed ferrets, California condors, wood bison, and many others.

With more management tools to reduce, prevent, and respond to human-bear conflicts, this rule will help increase human acceptance of grizzly bears as they return to the landscape.

Having wiped out the grizzly bear population over the past 150 years, we now have the unique opportunity and the ethical obligation to restore them to their native home, where suitable habitats still exist.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to the state through the strategy laid out in Alternative C. Doing so will restore an important piece of the American ecosystem, as well as regional culture, and overall natural heritage.

Thank you for taking the time to keep our North Cascades wild!

Correspondence: I DO NOT support reintroducing grizzly bears to the North Cascades.

Other species have been living and people have been recreating in the area for years without grizzlies. "Because they used to live here" is not sufficient reason to re-introduce an apex predator. Inexperienced or unprepared people are not the only ones who can be hurt by Grizzlies. People will certainly die as a result if this effort prevails.

Correspondence: I am against bringing in grizzly bears to our state, Under a Washington state law (RCW 77.12.035),

WDFW may not transplant or introduce grizzly bears into the state and may only use bears native to the state for management programs. In addition, WDFW must engage in all discussions with federal and state agencies relating to grizzly bear management. Not only is it illegal under this RCW, but it would negatively impact our area in so many ways. Our ecosystem can't support the bears we already have in our area, this would cause the imported bears to seek their food in other areas after decimating the food supply that is currently available to our bears. I am totally against this move. We live in these mountains, and we do NOT want bears that are not native to our area brought in. They are not the same as the grizzly bears that have been here for over 100 years. Leave this alone, it will end in a way no one wants.

Correspondence: I support the proposed introduction of an experimental grizzly bear (*Ursus arctos horribilis*) population in the North Cascades ecosystem as stated in Alternative C under Section 10(j). "No net loss of core" is a well-balanced approach that seems very well suited and positioned to succeed because of:

- 1) Long-standing, cooperative efforts among federal, state and tribal agencies over multiple jurisdictions, including the Canadian government.
- 2) Establishment of management zones 1, 2 & 3, with well-defined actions appropriate to each zone.
- 3) Incremental introduction of five to seven bears per year over a period of 8 - 9 years with close management and monitoring for at least 30 - 45 years.
- 4) Reasonable and well considered conflict prevention measures which are likely to be successful.
- 5) Well conducted community involvement and input since 2018.

Thank you.

Correspondence: Hello, I am writing to state that I am opposed to reintroducing grizzly bears into North Cascades National Park. As an avid hiker, backpacker, and skier, I--along with my family and my friends--am a frequent visitor to the NCNP. In fact, my son's first backpacking trip, when he was just 9 months old, was up Cascade Pass to Sahale Arm, over 15 years ago. We have hiked and backpacked in many of our National Parks, and it is a different experience to be in an area with a know grizzly population.

While rare, grizzly attacks do occur and the risk to people is significant. As demonstrated in the recent horrific attack at nearby Banff National Park, bear spray is not effective against an aggressive grizzly. Nonetheless, tourists will find it necessary to carry bear spray around the visitor centers, as seen in parks like Yellowstone, creating an atmosphere of nervous hikers and unnecessary waste. Also, if the only known deterrent for an attacking grizzly is a firearm, we could see an increase in hikers carrying guns in the North Cascades. Is that something we want for this park?

From an ecological standpoint, there is no good reason to transfer grizzly bears into the North Cascades. It is impossible to return an ecological system to its previous state. Changes will always remain. There is no niche in the North Cascades that can only be filled by the presence of grizzlies. There is not a lack of balance that requires grizzlies to rectify. The promise of bringing bears that only eat berries, and won't impact salmon populations, seems shortsighted. Wildlife biology is not chemistry or physics--animals change and evolve in new environments. After all, some grizzlies at some point figured out that salmon are tasty and high in calories, so the transferred bears might figure that out too. I would never support the removal of an indigenous species such as the grizzly bear from an area, but likewise without a compelling reason to add them back into the ecosystem, I do not support their reintroduction.

I hope you will consider the voices of the many local users and neighbors of the North Cascades who are opposed to adding grizzlies to the park. I am thankful that when my children were small, we were able to enjoy the wonder of backpacking in this majestic mountain range without the risk of grizzly bear encounters, and I hope that many hikers in the future will have the same experience.

Correspondence: I support Alternative C: Restoration with Section 10(j) Designation as it is the best choice for bears and the people who live, work, and recreate in the North Cascades Ecosystem. It is based on a similar approach that has worked in Montana where grizzlies are recovering in the Cabinet-Yaak mountains with few problems and with the acceptance and involvement of local communities.

Furthermore, the 10(j) rule provides the necessary tools and flexibility to reduce, prevent, and respond to human-bear conflict. I believe that the 10(j) rule if properly implemented, will lead to greater successful coexistence between people and grizzlies as they return to historic range.

Correspondence: Hello, I am writing to express my opposition to the reintroduction of Grizzly Bears into the North Cascades of Washington State. I have many loved one who that live in that area in the outskirts of towns. and I am greatly concerned for their safety should this plan move forward. With many of their homes, there is no way to adequately secure borders and prevent Grizzly Bears from being able to come onto property. It's not as simple as building a fences the topography and other physical characteristics of the land in which they live. Bringing Grizzly Bears into the area would put them, their livestock, pets, etc. in danger. It is difficult enough to protect against existing predators that are already present in these lands, adding a new one, one that's incredibly dangerous, would make it even harder and more dangerous. I urge you to reconsider this plan and perhaps find a different area to use as habitat for the bears. They have not been in this area for a ver long time, and the ecosystem has been doing great, there's no reason to introduce it. The people who are urging this will not be the ones to face the consequences, of putting people pets and livestock in danger.

Please do not pass this plan if you care about the people.

Correspondence: I disagree with reintroducing grizzly bears to the North Cascades. They pose a life-threatening risk to people and their pets as well as to ranchers and their livestock. With family who live in Montana, where grizzly bears are already a serious enough problem that kids can't go outside to play without bear spray and a handgun, I find it foolish to bring them into Washington so that we, too, may end up with the same problem. Grizzly bears are so much more powerful and dangerous compared with the black bears we are familiar with. Please do not bring back grizzly bears to the North Cascades.

RE: Draft Grizzly Bear Restoration Plan-Environmental Impact Statement North Cascades Ecosystem
comments submitted electronically through the comment portal - <https://parkplanning.nps.gov/>

Dear Superintendent Striker,

Thank you for the opportunity to provide comments on the North Cascades Ecosystem Grizzly Bear Restoration Plan and Draft Environmental Impact Statement (DEIS).

The Access Fund, The American Alpine Club, American Whitewater, Evergreen Mountain Bike Alliance, The Mountaineers and Washington Trails Association represent tens of thousands of human powered recreationists who care deeply about public lands in the North Cascades Ecosystem. Our organizations work together on issues relating to recreation, access and conservation. We have participated in grizzly bear planning efforts for many years. Our groups submitted scoping comments in 2015 on the North Cascades Ecosystem Grizzly Bear Restoration Plan and comments in 2017 on the previous DEIS. We submitted a comment letter in 2022 during the scoping for this project. Staff from our organizations have reviewed the published materials, attended public meetings and discussed the implication of the various alternatives with members of the planning team from both co-lead agencies. This letter builds on our previous communications. We ask that you consider our input and add additional information to the final EIS regarding the impacts of grizzly bear reintroduction on recreation. We hope that our comments, which are grouped thematically, will be useful to you as you move ahead with this process.

Alternatives

Our organizations have considered the alternatives presented in the DEIS. We do not have a shared position on the merits of reintroducing grizzly bears into the North Cascades Ecosystem (NCE), but we all believe that the public would benefit from a larger grizzly bear management toolkit than is available under existing Endangered Species Act section 4(d) rules. If North Cascades National Park selects one of the action alternatives, we believe the responsible official should select alternative C, the preferred alternative.

Classifying the reintroduced population of grizzly bears as a nonessential experimental population is appropriate. The DEIS states that alternative C would lead to greater social tolerance of grizzly bears and “improve the chances of establishing and maintaining a grizzly bear population in NCE” (72). Based on this analysis, alternative C would best achieve the purpose of the plan and most likely meet the needs of the recreation community. The preferred alternative would give managers greater flexibility to relocate bears and would allow managers to use deterrence to prevent conflicts from arising.

Our request:

Alternative C allows deterrence “for the purposes of avoiding human-bear conflicts or to discourage bears from using areas in the immediate vicinity of homes and other human-occupied areas” (38). To the best of our knowledge “human-occupied areas” is not defined in the DEIS. We request that the final EIS clarify the types of recreation sites (ex. campground, trailheads, backcountry camps) that fit under this definition and explicitly allow deterrence from high-use recreation areas under the proposed 10(j) rule.

Consequences for Recreation

The DEIS highlights the importance of outdoor recreation to residents of Washington and the state's economy. The DEIS states that “recreational use of federal lands in the NCE is estimated to be 8 million recreation visitor days per year” (111). It also says that “more than 264,000 jobs in Washington were supported by outdoor recreation spending” (137). The plan acknowledges that hiking, climbing, water-based recreation, snow-based sports and other recreational opportunities are important uses of the project area. The planning team assessed the potential impacts on visitor use and recreation. They concluded that in both alternative B and alternative C reintroducing bears would have both adverse and beneficial impacts. The DEIS states that the net impact would be positive as a result of reintroduction since the public would have the opportunity to view a restored population of grizzly bears.

More information on the impacts of reintroducing grizzly bears on recreation is needed in order for the public and the co-lead agencies to fully evaluate the consequences of the proposed action on recreation and rural economies. In particular, our organizations did not find sufficient discussion of the impacts of the action alternatives on backcountry recreation. We wish to know whether additional restrictions will be added that impact access to outdoor recreation. Does North Cascades National Park intend to change its Wilderness Management Plan or other management direction in ways that would impact recreational use? In the final EIS, we ask that you address how the following may be impacted or include language stating that no changes are required:

Access to developed and dispersed recreation sites by motor vehicle;

Backcountry recreation activities that utilize trailed and trail-less areas such as hiking, climbing, mountaineering, boating (e.g. packrafting), mountain biking and trail running;

Day trip party size restrictions, both minimum and maximum;

Overnight backcountry use and party size restrictions, both minimum and maximum; and

Permits for outfitters and guides.

Closures

Our organizations have communicated throughout the development of this plan that continued access to the special places in the North Cascades is incredibly important to hikers, climbers, mountain bikers and other recreationists. As such, we appreciate the language in the DEIS that specifies that releasing grizzly bears will have limited impact on public access and would not require long term closures. The DEIS says that “identified release sites would be in locations that are remote from high human-use areas” (129). It states that release sites would be surveyed and agency staff would select different locations if park staff determine that visitors are in the vicinity of a proposed release site (30). This guidance will minimize impacts on backcountry visitors during bear release activities. Our organizations noted that two of the three proposed release sites contain national scenic trails. Thank you for specifying that “the agencies do not anticipate the need to institute trail closures along the Pacific Crest Trail and other high use trails” (122).

Long term impacts from reintroducing bears on recreational access is partially addressed in the restoration plan. We appreciate that the plan suggests that reintroducing bears will not cause major changes to public access. The DEIS says:

Under all action alternatives, occasional short-term closures (a few hours up to a few days) could take place on a case-by-case basis, based on bear activity (e.g., a female with cubs near high human-use areas) or timing and location of a release... No long-term closures or modifications to public access would be implemented because of grizzly bear restoration. The agencies do not anticipate the need for lengthy closures such as those experienced in Yellowstone National Park because no similar bear congregation areas have been identified (32).

We believe that the intention to avoid extended area closures should be included in the final EIS. Additionally, we ask you to include more information on the process for determining when short-term closures are needed. In the final EIS, expectations around closures ought to be presented as clearly as possible. According to the DEIS, "grizzly bears frequently and successfully establish home ranges overlapping similar levels of human activity in other parts of their range" (67). Our organizations would like the final EIS to express succinctly that our best available science suggests that current levels of recreational use are compatible with grizzly bear recovery.

Our request:

Continue to avoid impacts to high use recreation areas and trails.

Clearly state that long-term closures are not required.

List the criteria for short-term closures; and

Share the approximate number of closures that the National Park Service anticipates will be required annually when the NCE contains a recovered grizzly bear population.

Wilderness

Thank you for including a thorough discussion of the impacts of the action alternatives on wilderness character. We hope to continue to review the analysis on this important topic, as you move forward with this process.

Our request:

The DEIS says that "Under the Wilderness Act of 1964, both the NPS and USFS would complete separate minimum requirements analyses to evaluate the necessity and impacts for all flights that require landing in designated wilderness lands under their management" (30). Please share these minimum tool documents when they are complete.

Agency Coordination

We understand that a federal agency may choose not to participate based in a NEPA process. This determination may be made based on staffing constraints. Under the relevant law "in response to a lead agency's request for assistance in preparing the environmental documents, a cooperating agency may reply that other program commitments preclude any involvement or the degree of involvement requested in the action that is the subject of the environmental impact statement" (40 CFR 1501.8). However, our organizations were surprised by the United States Forest Service (USFS) determination to not be a cooperating agency. Given that the Forest Service manages a majority of the land in the NCE, we would like to know more about this determination and whether the USFS has the resources it needs to support the management of grizzly bears on national forest lands.

Our request:

Please include a copy of the communication the Forest Service shared with the Park Service stating that they are unable to serve as a cooperating agency in the appendix of the final EIS.

Share information on the current conditions of agencies in the NCE and their preparedness to administer lands with grizzly bears.

Role of Non-Profit Partners

An important component of the proposed action is increased education of the public about grizzly bears. Our organizations expect that recreation nonprofits will have a significant role to play in helping visitors learn about recreating in grizzly bear country. The DEIS states, "Ongoing public outreach by nonprofit organizations...would promote tolerance of and coexistence with grizzly bears by addressing public safety concerns and provide information about grizzly bear ecology and

behavior” (32). If an action alternative is selected, we wish to work with you to coordinate messaging and maximize the effectiveness of our shared public education efforts.

Our request:

Proactively work with the human-powered recreation community to create education and outreach materials and programs that can reduce the risk of conflict between humans and grizzly bears.

Thank you for considering our input. We look forward to continuing to work with you on this long term project. Please contact our organizations if you have any questions or would like to further discuss our feedback and perspectives.

Correspondence: Comment Regarding the Proposed Reintroduction of Grizzly Bears
into the North Cascades Ecosystem
Property and Environment Research Center (PERC)
Bozeman, Montana
November 13, 2023

Note: A PDF of this comment, with citations and supporting material is available at: <https://www.perc.org/wp-content/uploads/2023/11/northern-cascades-grizzly-reintroduction-comment.pdf>

Main Points:

Species reintroductions, habitat restoration, and other proactive conservation efforts are essential to recovering endangered and threatened species. But in carrying out these efforts, federal agencies must work with, not against, states, communities, and private landowners. Trust between federal agencies and local stakeholders is critically important but has too often been lacking under the Endangered Species Act.

Restoring grizzlies to the North Cascades ecosystem would move the species closer to recovery. But the proposal has provoked significant opposition from local communities and private landowners. To address these legitimate concerns, the National Park Service and U.S. Fish and Wildlife Service should consider additional and more creative approaches to mitigate the costs grizzlies would impose on communities and landowners.

The Services should also plan for the reintroduction's success, including by providing more flexibility as the population grows and gradually transferring management responsibility to the state.

The Property and Environment Research Center (PERC) respectfully submits this comment regarding the National Park Service's and Fish and Wildlife Service's proposal to reintroduce grizzly bears into the North Cascades Ecosystem. Species reintroductions, along with habitat restoration and other proactive conservation efforts, are critical to the recovery of endangered and threatened species. To succeed, however, these efforts must be pursued with the local communities and landowners that are most affected, rather than be imposed on them.

The proposal to reintroduce grizzlies into the North Cascades has already stoked substantial local opposition. Such opposition has blocked previous efforts to reintroduce grizzlies and undermined the success of other species' reintroductions. To ensure that the reintroduction can move beyond a mere plan into an on-the-ground reality, and that a reintroduced population can succeed, the Services must be open to more creative options that allow reintroduction to be done with local communities and landowners, not to them. That means that the Service should consider additional ways to reduce regulatory burdens and address other costs that the grizzly's return would impose. It should also plan for the population's ultimate recovery, including providing for even more flexibility and the transfer of management authority to the state as the population grows.

The Property and Environment Research Center

PERC is the national leader in market solutions for conservation, with over 40 years of research and a network of respected scholars and practitioners. Through research, law and policy, and innovative field conservation programs, PERC explores how aligning incentives for environmental stewardship produces sustainable outcomes for land, water, and wildlife. PERC has produced extensive research on how the Endangered Species Act could be better implemented to achieve its ultimate goal of recovering species by removing perverse incentives and encouraging habitat restoration and proactive recovery efforts. Founded in 1980, PERC is nonprofit, nonpartisan, and proudly based in Bozeman, Montana.

Recovery Takes Effort, Cooperation, and Trust

The ultimate goal of the Endangered Species Act is to recover species to the point that they are no longer endangered or threatened with extinction. This is no easy task. For most imperiled species, leaving them alone is not enough. But proactive recovery efforts cannot easily be regulated into existence. Even the most well-intentioned regulation may discourage such efforts through perverse incentives. As a consequence, the Endangered Species Act's results to date have been mixed. It has been remarkably effective at one part of the recovery goal, preventing extinction so that recovery is still possible. Ninety-nine percent of listed species persist today, and hundreds of extinctions may have been avoided. But only 3% of listed species have recovered over the last half-century--far fewer than the Fish and Wildlife Service projected by now--and a similarly small percentage have populations that are improving.

PERC supports the Fish and Wildlife Service's efforts to facilitate more voluntary recovery efforts and undertake its own proactive efforts, including species reintroductions. The long-term effectiveness of such efforts depends on building trust and goodwill with states, local communities, and landowners. It also depends on creating the right incentives for conservation. To that end, PERC has urged the Fish and Wildlife Service to be more creative in its regulatory decisions and recovery projects to make imperiled species an asset rather than a liability for the local stakeholders whose actions have the greatest impact on recovery.

An Infinite Number of Options

Restoring grizzly bears to the North Cascades would be a significant, positive step toward the recovery of grizzlies in the lower 48 states. But that reintroduction will come at a cost, including human deaths and maulings, lost livestock and increased costs to ranchers, mitigation costs to reduce conflict, and changes to the ecosystem and other wildlife populations. Without policies to reduce these costs or divide them more fairly among the public, these costs will fall disproportionately on

local communities and landowners. This needlessly pits grizzlies against communities and landowners, which would be an obstacle to reintroduction and ultimate recovery.

This needn't be so. The Fish and Wildlife Service has a unique degree of flexibility it should use to address costs on local communities and landowners, while also charting a path toward the long-term recovery of the species. The grizzly bear is listed as a threatened species, rather than endangered, a status which triggers no automatic regulation of private activity. Instead, for threatened species, Congress gave the Service "an almost infinite number of options" to design regulations necessary and advisable for the conservation, i.e. recovery, of the species. For nonessential experimental populations, the Endangered Species Act also forbids the designation of critical habitat and does not presumptively regulate private activities but gives the Service flexibility to design a program to recover the reintroduced population. In other words, the Service has maximum flexibility to design a plan for grizzly reintroduction that addresses the concerns of local communities and landowners.

Despite this flexibility, the current proposal considers a narrow range of options. It considers 1) doing nothing; 2) reintroducing bears but applying existing regulations to them; or 3) reintroducing bears and issuing a less stringent regulation for the specific population, including very limited regulation of activities affecting bears on private land. Thus, the Fish and Wildlife Service has narrowed its "almost infinite number of options" to three.

Of these options, #3 is clearly the best and the Service deserves credit for designing it to address many concerns communities and landowners have about returning grizzly bears to the area. The Service's proposal focuses reintroduction and recovery on federal land and imposes relatively limited regulation on private land. For instance, the proposed rule identifies three zones, with each playing a different role in the population's recovery. Zone 1 is the primary area that will be used for reintroduction and contains the core habitat suitable for the species. Zone 2 contains suitable habitat for the species and would accommodate grizzly movement and dispersal as the population grows. And Zone 3 is everything else. Importantly, Zones 1 and 2, which would have the strictest regulations, are defined to explicitly exclude any state or private lands in these areas. All non-federal land, regardless of where it is, is considered part of Zone 3.

By classifying all state and private land as Zone 3, the Service would limit the extent to which reintroduced grizzlies are a regulatory liability for communities and landowners. For instance, incidental take would not be regulated on private land, nor would hazing and other deterrence efforts. But the proposal would still make grizzlies a regulatory liability.

Ranchers have grazing privileges for federal lands within Zones 1 and 2 that may be essential to sustaining their operations. The proposed rule acknowledges, for instance, that there are eight active grazing permits authorizing nearly 20,000 privately owned animals to graze federal lands in Zone 1. In the event of a conflict between grizzlies and livestock, the proposed rule only allows the rancher to haze or otherwise deter the bear, presumably at the rancher's expense. If deterrence is inadequate to prevent conflict, the proposed rule gives the Service the discretion--but no obligation--to relocate or otherwise take the bear involved in the conflict. And the proposed rule would only allow the Service this discretion if it is "not reasonably possible" to eliminate the conflict through deterrence and nonlethal measures, some of which would be at the rancher's expense. Preferring nonlethal solutions to conflict is obviously better for grizzly recovery, but it's also important to recognize that it can increase the regulatory liability bears represent to private parties.

On private lands, it would be easier to relocate or otherwise take a bear that poses a threat of conflict, since there's no requirement to exhaust deterrence and non-lethal means first. But, again, the proposed rule merely gives the Service the discretion; the Service should instead commit to landowners that these tools will be used.

The proposed reintroduction may also affect forest restoration activities in the area, which includes a landscape identified in the National Forest's Wildfire Crisis Strategy. The proposed rule notes, correctly, that a nonessential experimental population designation limits the consultation requirement federal land management agencies would otherwise have under the Endangered Species Act because, for these purposes, the population is treated as a species merely proposed for listing. Even in the event that the agency is required to confer with the Service or a lawsuit is filed challenging compliance with that obligation, the Endangered Species Act allows the agency to move forward while it confers or defends litigation.

But consultation is not the only way that the presence of grizzly bears might complicate the regulatory environment for forest restoration. Impacts to the reintroduced population would also have to be analyzed under the National Environmental Policy Act and interest groups could challenge the adequacy of that analysis. Being in the Greater Yellowstone Ecosystem, PERC is well aware that activists frequently do file such challenges against forest restoration projects. Fortunately, Washington sees significantly less litigation against forest restoration than Montana. But that would likely change with the introduction of a charismatic species like the grizzly bear. And even if reintroduction doesn't lead to more litigation, the species' presence may slow down the process for evaluating and approving forest restoration projects, extending the years it already takes to get projects moving.

PERC does not mean to suggest that this is a reason not to reintroduce grizzly bears to the North Cascades. But the potential regulatory consequences for forest restoration merit further attention than they have received in the proposed rule and

environmental impact statement. It's also worth considering how supporters of the proposed reintroduction could help address this problem. It is well established that private parties can help perform or pay for the analysis required by NEPA. In Northeastern Washington's "A to Z" project, for instance, Vaagen Brothers Lumber covered the cost of NEPA analysis for a forest restoration project under one of its stewardship contracts with the Forest Service. There's no reason that environmental organizations and other supporters of wolf reintroduction could not do the same.

Further analysis of this and the other issues identified above may help to minimize the proposal's legal risks. Under the National Environmental Policy Act, the National Park Service and Fish and Wildlife Service must consider a reasonable range of alternatives to its proposal, which should include a range of regulatory approaches for the reintroduced population. The Service must also demonstrate, under the Endangered Species Act, how any final regulation for the population is "necessary and advisable" for its conservation and recovery, a standard that requires consideration of these and other tradeoffs.

Make Grizzlies An Asset, Rather Than Liability

Even with the perfect regulation in place, introducing an apex predator to the landscape will inevitably impose liabilities on neighboring communities and landowners. To the Park Service's and Fish and Wildlife Service's credit, they acknowledge these costs and don't attempt to downplay them by focusing on the initial small size of the reintroduced population.

To determine the losses that ranchers and sheep-herders might face due to direct predation, for instance, the Environmental Impact Statement considers the effect of having 200 bears in the ecosystem (the long-term goal of the reintroduction), rather than the short term goal of 25 bears. According to the proposed rule, the expected loss of 19 cattle and 4 sheep per year to grizzly depredation in the area would cost ranchers and herders approximately \$21,000 annually. While small compared to some other costs of the program--capturing and relocating grizzlies is anticipated to cost \$150,000 per year--these costs could be significant for ranchers, who average only \$25,000 per year in net income. And this estimate only includes the direct costs of depredation. As the Services acknowledge, ranchers would also bear indirect costs, such as monitoring costs, mitigation or deterrence costs, and reduced weight of animals.

Fortunately, there are ways that the Services, states, and private parties can mitigate these costs and even make reintroduced populations an asset to communities and landowners. Recently, PERC and other conservation organizations partnered with a rancher in Montana's Gravelly Range to reduce conflicts between grizzlies and livestock and the lethal take of grizzlies that commonly results from such conflict. Under the agreement, the conservation organizations compensate the rancher for implementing strategies to reduce conflict, including adjusting the number of cattle on the allotment and timing of their presence, while increasing the profitability of the ranch.

When wolves were reintroduced to the Greater Yellowstone Ecosystem, the Defenders of Wildlife raised money from its supporters to fund a private, voluntary program to compensate ranchers for livestock lost to wolf depredation. This gave the organization a financial stake in the reintroduction and an incentive to work with ranchers to find new ways to mitigate the costs predators impose on livestock operations. That model has since been expanded to include payments to ranchers and landowners who accommodate imperiled wildlife or provide habitat, with such "payments for presence" tied to the size of the population so that landowners directly benefit from its increase. PERC has recently applied the payments for presence model to conserve elk migration in the Greater Yellowstone Ecosystem.

To facilitate the recovery of a reintroduced population of black footed ferret, the Department of Agriculture compensates landowners for conservation practices that maintain or restore habitat. In a recent revision to its regulation of the ferret population, the Fish and Wildlife Service emphasized the importance of these incentive programs to habitat restoration and, ultimately, species recovery.

In the Environmental Impact Statement, the National Park Service notes that similar compensation might be applied to help the grizzly bear, "if private funds are available." Washington has a fund to compensate ranchers and farmers for losses caused by certain wildlife, including bears. Much of the funding and regulation for that program is addressed to wolves, so it's not clear how much compensation might be available through this program for grizzly bear depredations. But, more importantly, it's not clear why the Service does not take on this financial burden as part of the reintroduction rather than imposing it on the state. If losses max out at \$21,000 annually, as the Park Service estimates, compensation for these losses would be a small price to pay to facilitate the reintroduction, and less than 3% of the estimated annual budget for the program.

The Services should also consider how its decision might encourage conservation organizations and others to provide those funds, if the Service declines to, and develop other innovative programs to make grizzlies an asset to local communities and landowners. There are numerous ways this could be done. Reintroduction could be conditioned on the availability of private funds or programs to reward landowners who mitigate conflicts. To maintain the motivation for these efforts after reintroduction, the stringency of the regulation could also depend on conservation organizations continuing to implement

programs to reduce liabilities for landowners.

The above examples demonstrate that private conservation organizations can be part of the solution for wildlife conflict and species recovery. Compared to the ranchers in the area, our groups also have the resources to do this effectively. It's only fair that proponents of grizzly reintroduction bear more of the costs of seeing their goals achieved, rather than foisting the costs on landowners who may oppose the effort. It's also better for the long-term success of the reintroduction effort by reducing conflict, which has been a significant hindrance to the success of other reintroduction efforts.

Plan For Success

Finally, the Services should consider how the proposed regulation should adapt as the reintroduced population grows and expands, especially how it might facilitate that recovery and the ultimate transfer of management to the state. The Fish and Wildlife Service has previously determined that 200-400 grizzly bears would likely need to be established in the North Cascades to meet the recovery goal for that population. Yet, according to the draft Environmental Impact Statement, it will likely take 60-100 years for the proposed reintroduction to establish a population of 200 bears. It may be untenable to ask the state, communities, and landowners to accept decades of federal control over any activity in the area that affects a bear, even if the Service retains the flexibility in the proposed rule throughout that time. And that's assuming that the population would promptly be delisted once it hit that goal, which has not been the case when other grizzly populations have hit their population targets. To provide a better path for the recovery and ultimate delisting of the North Cascades population, the Service should provide in its rule that management responsibility for grizzly bears will transition to the state gradually as the population grows. That plan should proceed automatically as benchmarks are met, rather than be dependent on subsequent rulemakings by the Service and the litigation that could block them.

Conclusion

For decades, we've fallen short in fulfilling the Endangered Species Act's goal of recovering species so that they are no longer endangered or threatened with extinction. Proactive efforts like the proposed reintroduction are essential to improving the recovery rate. But it is also essential that those efforts be carried out in a way that is sensitive to the regulatory and practical burdens rare species can impose on private landowners. Ultimately, successfully recovering species depends on making them assets, rather than liabilities, to the communities and landowners that have the greatest influence on their long-term survival.

Correspondence: The officers and staff of our small business, an outfitters business of over four decades, and joined by our customers all submit strongly for Alternative 'A' (no action). Over forty (40) years of high country backpacking experience supports the reality that the NCE habitat will not adequately support survival of Grizzlies - faced with starvation or survival the apex predators will leave the NCE , travel north and south in order to forage. Increased violent Human-Bear conflicts will result, more so in our more populated communities as compared to those of Montana, Wyoming, and Idaho. The result will be a net loss of the Grizzly species - the opposite of what the NPS and FWS are promoting to the public. Many Grizzlies will be taken directly resulting from domestic food conditioning, livestock depredation, attacks on domestic pets, attacks on humans, and starvation.

Leave the Grizzlies in their existing habitat where they are successfully breeding.

Also have respect for our Washington State law which in part reads, "Grizzly bears shall not be transplanted or introduced into the State. Only grizzly bears that are native to Washington State may be utilized by the department for management programs."

Consequences of Grizzly bear attacks:

The following news reports are the consequences of Department of Interior out-of-control Grizzly bear recovery programs, yet they represent a small subset of the number of actual incidences and severity of Grizzly attacks against humans and livestock.

Re: Draft Grizzly Bear Restoration Plan/Environmental Impact Statement, Northern Cascades Ecosystem

The Rocky Mountain Elk Foundation's (RMEF) mission is to ensure the future of elk, other wildlife, their habitat and our hunting heritage. We represent more than 225,000 members nationwide and more than 12,500 members in Washington. RMEF's members include hunters, ranchers, guides, outfitters, other business owners, wildlife enthusiasts and other conservationists who have both recreational and economic interests in hunting and enjoying elk.

Since inception in 1984, RMEF has conserved or enhanced more than 8.7 million acres of North America's most vital habitat for elk and other wildlife, including over 500,000 acres in Washington, some of which overlaps with grizzly bear recovery zones. This work includes land acquisitions, exchanges, voluntary conservation agreements and improving habitat quality through stewardship projects such as prescribed burns, thinning, weed treatments, planting native vegetation, adapting fencing to be more wildlife-friendly, etc.

The Northern Cascades Ecosystem (NCE) supports diverse wildlife species, including the North Cascades Roosevelt elk herd. For the past several decades, managers at the Washington Department of Fish and Wildlife (WDFW) have been working to restore the elk herd to populations within the stated objective of 1,700-2,000 elk. Still short on this goal, RMEF is concerned with how a grizzly bear restoration in the NCE will impact WDFW efforts to restore elk in this area.

RMEF has a long history of conservation work in the NCE that has benefitted elk and other wildlife, including grizzlies. In the NCE, RMEF and partners have conserved more than 700 acres of key wildlife habitat through fee land acquisitions. In addition, RMEF has directly contributed over \$162,000 and leveraged an additional \$340,000 to help with wildlife research and to enhance wildlife habitat on over 25,400 acres in the NCE. RMEF land conservation, research and habitat enhancement efforts have directly benefitted private, state and federal lands within the NCE. Grizzly bears have and will continue to benefit from RMEF's efforts.

In 2021, the State of Montana filed a grizzly bear delisting petition, followed by similar petitions from Idaho and Wyoming in early 2022. The U.S. Fish and Wildlife Service (USFWS) has completed the initial review of three petitions filed, finding that two petitions present substantial information indicating the grizzly bear in the Northern Continental Divide Ecosystem (NCDE) and the Greater Yellowstone Ecosystem (GYE) may qualify as their own distinct population segment (DPS) and may warrant removal from the list of endangered and threatened wildlife. In February 2023, the Service initiated a comprehensive status review of the grizzly bear in the NCDE and GYE based on the best available scientific information to inform a 12-month finding. If those findings result in proposing one or more DPSs for delisting, it will change the context of the ongoing recovery for the rest of the population in the larger listed entity, including the NCE.

RMEF has long advocated for state management of grizzly bears, which is in line with RMEF's support of the North American Model of Wildlife Conservation, under which state management of wildlife along with the financial contributions from hunters has dramatically increased wildlife populations across the U.S. in the last 100 years. RMEF supports removal of grizzly bears from the ESA list, transferring its management to state wildlife agencies.

RMEF requests that the Grizzly Bear Restoration Plan for the NCE and USFWS proposed Rule be put on hold until the Service issues a 12-month finding on the DPSs for delisting - in order to properly analyze the effects of a proposed restoration. As such, RMEF's recommends the 'No Action Alternative - Existing Management.'

While RMEF's preferred alternative is 'No Action,' we understand that the USFWS and National Park Service (NPS) may choose to continue finalizing the proposed Rule and Plan for a nonessential experimental population (NEP). Under this circumstance, RMEF offers the following comments:

PROPOSED NONESSENTIAL EXPERIMENTAL POPULATION:

RMEF agrees with the USFWS's assessment that the presence of grizzlies in the NCE is not essential for the continued existence of grizzlies in the U.S. If the USFWS and NPS move forward with this restoration effort, RMEF supports a nonessential experimental population (NEP) and associated 10(j) designation (in Alternative C). A designation of NEP provides additional flexibility needed to manage the grizzly population and to protect livestock, wild ungulate populations, etc. through relaxed federal agency consultation requirements under section 7(a)(2).

THE PROPOSED GEOGRAPHIC BOUNDARY OF THE NEP:

RMEF supports the proposed geographic boundary (the entire state of Washington except the Selkirk Ecosystem Recovery Zone), as it allows for maximum management flexibility within the core release area as well as other locations grizzlies are expected to disperse to.

THE PROPOSED MANAGEMENT ZONE BOUNDARIES AND MANAGEMENT OPTIONS WITHIN EACH ZONE:

RMEF appreciates recognition that some areas of Washington are likely incompatible with grizzly bear presence due to high levels of private land ownership and associated development and/or potential for bears to become involved in conflicts, and that the Plan will allow more management flexibility to minimize impacts of grizzly bears on landowners and other members of the public. However, splitting the state up into three separate management zones creates unnecessary complexity in managing grizzlies going forward and locks in specific management activities (particularly in dealing with conflict grizzlies) that can or cannot be performed in a given zone.

Rather than institute a new system with multiple management zones (each with different restrictions), RMEF recommends combining Zones 2 and 3. Zone 1 could continue to be defined as the formal recovery zone as outlined in the recovery plan (excluding state and private land) and serve as the reintroduction location (on federal land). The rest of the state of Washington would be managed under a single zone approach (see specific recommendations below).

PROPOSED MEASURES TO PREVENT AND MINIMIZE HUMAN-GRIZZLY CONFLICT:

RMEF does not agree with the proposed approach to managing grizzly conflict and requests scientific backing as to the proposed, tiered system for management. Instead of multiple management zones/approaches, RMEF recommends that the

entirety of the NEP boundary allow for grizzly management as is proposed within Zone 3. These management actions allow for greatest flexibility in managing conflict grizzlies and in utilizing relocation when needed. There is currently no justification to split management zone actions when all activities still require authorization by the USFWS or an agent. The following actions should be allowed across the NEP, as currently described for Zone 3:

- o Take of grizzlies in self-defense or defense of others
- o Exemption of take resulting from otherwise lawful activities (e.g., timber harvest, road construction, recreation)
- o Intentional deterrence of bears for the purposes of avoiding human-bear conflict
- o Exemption of take associated with research and recovery actions
- o Relocation or deterrence of bears by USFWS or an authorized agent for recovery purposes, for single-conflict incidents or as a preemptive action to prevent conflict
- o Lethal removal by Federal, State, or Tribal authorities of grizzly bears involved in conflict
- o Ability for USFWS or an authorized agency to issue written, time-limited conditioned lethal take authorization to a private landowner to kill a bear presenting an ongoing threat to human safety, livestock, or other property (e.g., compost, chickens, beehives) if there is a demonstrable and ongoing threat and when it is not reasonably possible to eliminate the threat through nonlethal means.

In addition, RMEF asks the NPS and USFWS to adopt additional grizzly management tools that are described in the preferred alternative of the Environmental Impact Statement Colorado Gray Wolf 10(j) Rulemaking (USFWS 2023, Table ES-1, pp iii-xiv), such as opportunistic and intentional harassment, take of grizzlies in the act of depredation on public land, impacts to biological resources, etc.

LAND MANAGEMENT ACTIONS:

The draft Plan and proposed Rule lack a description of current habitat/land management activities outside of travel management. RMEF requests a summary of active projects designed to improve habitat for wildlife, fuels reduction, timber management, etc. within the NCE and proposed NEP boundary. This should be followed with an assessment of how grizzly restoration will affect active forest management projects on federal and nonfederal land to benefit wildlife.

Each forest plan has goals and objectives for maintaining/improving vegetative conditions to ensure healthy forests that support a variety of species, including prey for grizzlies. Elk and other big game species represent a significant prey base for grizzlies and the draft Plan and proposed Rule should include habitat management components needed to benefit those species.

LAND MANAGEMENT ACTIVITIES ON FEDERAL LAND OUTSIDE OF THE NCE:

The proposed Rule indicates: 'Section 7(a)(1) of the ESA requires Federal agencies to use their authorities to carry out programs to further the conservation of listed species, which would apply on any lands within the experimental population area. As a result, and in accordance with these regulations, if we adopt this rule as proposed, some modifications to the Federal actions within the experimental population area may occur to benefit the grizzly bear, but we do not expect projects on Federal lands to be precluded or likely to be substantially modified as a result of these regulations.' RMEF seeks clarification on what forest management activities may be precluded or substantially modified in order to meet these regulations. A formal assessment should be conducted that considers the array of current and planned forest or rangeland management activities on federal land to truly identify the potential impacts on these actions due to the grizzly restoration effort.

RMEF further recommends that Section 7(a)(1) be applied to the area only within the NCE and not the entire proposed NEP boundary. Otherwise, this regulation would be applicable across the entire state of Washington, including areas that the proposed Rule recognizes are unsuitable for grizzlies. The grizzly restoration in the NCE should not impact land management activities on federal land outside of the NCE, particularly since it was determined that this would be a nonessential population.

BEST AVAILABLE SCIENCE:

RMEF expresses concern over the reliance on two outdated studies to establish that sufficient food resources would be available for a reintroduced grizzly population. While two newer studies model the habitat suitability and carrying capacity (Lyons et al. 2018 and Ransom et al. 2023) in the NCE, the Plan and proposed Rule also reference Almack et al. (1993) and Gaines et al. (1994) repeatedly to show abundant food resources exist for grizzlies. These studies measured vegetation composition, structure and presence of forage plant species in addition to mapping ranges of prey species (ungulates). The Plan and proposed Rule use the results of these outdated studies to conclude that sufficient vegetative grizzly bear foods are readily available in the U.S. portion of the NCE, and that the occurrence of wildlife prey species can sustain a grizzly bear population.

RMEF is concerned about the use of these data for such conclusions. Data from studies published in 1993 and 1994 do not appropriately represent the vegetative conditions nor the prey availability/distribution that exist now, 30 years later. The Plan and proposed Rule, indeed, recognize the drastic changes that have occurred within the NCE landscape since the recovery plan was last updated. One significant change on the landscape is the loss of whitebark pine, widely recognized as an important food source for grizzlies. The loss of this crucial resource across the NCE (Rochefort et al. 2018) will have trickling effects to other food resources preferred by grizzlies, particularly prey species (ungulates).

RMEF opposes the use of these outdated studies and requests updated science be used to inform the Plan and proposed Rule on food availability for grizzlies in the NCE through more recent vegetation surveys and coordination with WDFW on prey (ungulate) availability and distribution. The EIS should include an analysis, using updated science, to assess impacts to ungulates, given the widespread loss of whitebark pine. As noted previously, WDFW staff have been working to restore the North Cascades Roosevelt elk herd to populations within the stated objective of 1,700-2,000 elk. Still short on this goal, RMEF is concerned that use of old studies from 1993 and 1994 do not represent the current status of a primary prey for grizzlies in the NCE.

RMEF appreciates the opportunity to review and comment on the NPS and USFWS Plan and proposed Rule and looks forward to future coordination.

Sincerely,

Director of Wildlife and Habitat
Rocky Mountain Elk Foundation

Correspondence: RE: Comments on the September 2023 Grizzly Bear Restoration Plan DEIS (GBDEIS2)

Dear Superintendent Striker

By letter dated April 25, 2017, Darrington Area Resources Advocates (DARA) submitted extensive comments on the 2017 Grizzly Bear DEIS (GBDEIS1) addressing introduction of Grizzly Bears into the North Cascades Ecosystem (NCE).

This (2017) letter summarized our concerns at that time as follows:

1. The GBDEIS does not present compelling evidence that a substantial grizzly bear population ever existed in the NCE.
2. The DEIS presents no evidence that the NCE is impaired in any significant way due to the absence of grizzly bears.
3. The DEIS does not describe a compelling essential need to reintroduce grizzly bears into the NCE at this time based on the current status of the species in the coterminous United States and nearby robust grizzly bear populations in British Columbia.

4. Local communities within and surrounding the NCE may be adversely impacted by introduced grizzly Bears in the long term who likely will roam off federal lands onto low elevation private lands within and adjacent to the NCE. After reviewing GBDEIS2, we believe this list remains valid today and that addressing items 1-3 in the FEIS is necessary to establish a compelling need for the proposal at all at the present time.

It is unclear to us why the original GBDEIS1 was set aside. We were encouraged that the November 14, 2022 NOI stated: "The NPS and the FWS previously proposed to restore grizzly bears to the NCE and produced a draft EIS for public review and comment in 2017 (82 FR 4416, January, 13, 2017). Public comments that were provided during that prior EIS process will also inform this new EIS and the development of alternatives." Unfortunately, GBDEIS2 provides no appendix which describes how comments received for GBDEIS1 were addressed in GBDEIS2 and for that reason we re-submit our previous comments (attached) into the record for GBDEIS2. Should a FEIS ultimately be produced we respectfully request that it include an appendix which specifically describes how comments have been responded to in the FEIS.

We turn now to our comments on GBDEIS2.

1. GBDEIS2 does not describe a compelling essential need based on the requirements or objectives of the ESA to reintroduce grizzly bears into the NCE at this time based on the current status of the species in the coterminous United States.

Only 1 element of the Purpose and Need statement for GBDEIS2 describes its relationship to the ESA: It stated there is a need to "Support the recovery of the grizzly bear to the point where it can be removed from the Federal List of Endangered and Threatened Wildlife." (GBDEIS2 Pg. ii)

There is one objective related to the ESA: "Support environmental and natural resource objectives related to the grizzly bear and contribute to grizzly bear recovery in the contiguous US." (GBDEIS2 . Pg. 4).

Nowhere, however, in the GDEIS is it described precisely described the basis for the need or how the Preferred Alternative meets the stated need or objective to recover the species so that it may be delisted. The GBDEIS actually states the reverse to be the case: "Restoring a population of this size [200 Grizzly Bears in the NCS] would likely take decades [60 to 100 years]. This restoration population goal is not a recovery goal for purposes of the ESA. Recovery goals are determined through a separate process." (GBDEIS Pg. 6 emphasis added).

As described further below (Item 4), we believe there is fundamental need to describe how Alternative C contributes to the Recovery and delisting of the Grizzly in the coterminous United States.

We do not dispute that other plans or policy may call for restoration of the Grizzly (NPS Park Policies for example) but a key and unanswered question is whether Alt C. contributes, as it apparently will not, to recovery and delisting of the Grizzly bear under the ESA.

2. GBDEIS2 does not present compelling or persuasive evidence that a substantial grizzly bear population ever existed in the NCE.

We commented extensively on this question in our April 25, 2017 filing. These comments remain unaddressed but for the following;

The GBDEIS cites a new study/synthesis in support of the assertion that a substantial and self-sustaining population existed in the NCE: A Synthesis of Historical and Recent Reports of Grizzly Bears (*Ursus arctos*) in the North Cascades Region (Rine et al. 2018). "This report provides documentation of grizzly bear presence from multiple sources, including observations from in and around the NCE from 1859 to 2015." (GBDEIS2 PG. 6).

This report summarizes a review of ethnographic literature which is summarized in Table 1 (Pg.). This table displays information for 7 tribes. A fair review of this information does not produce a strong conclusion of the widespread occupancy of the NCE by large numbers of Grizzly Bears. The narrative of the report states: "It is important to note that it is not clear how long ago these recounted observations and practices transpired. They are derived from relatively recent (late-1800s to 2000) transcriptions of events and observations that may have occurred from that time to many generations prior (Smith 1988) Pg. 8) and "there is no evidence of extensive direct killing of grizzly bears by indigenous people, but ethnographic records (Smith 1988) leave little doubt that they were occasionally killed in defense of life or food (Smith 1988, Bedal Fish and Bedal 2000, Sappington and Schuknecht-McDaniel 2001, McLaren et al. 2005)." (Pg. 10)

This report addition review of the Grizzly bear hide trade records taken at Hudson Bay Fort shown on this Map (Pg.4):

Hide counts from these forts is summarized in Table 2 (Pg. 12). The data shows that 95% of the hides were recorded in the 3 forts farthest away from the NCE namely Coville, Thompson/Kamloops and Nex Perces.

3. GBDEIS2 presents no evidence that the NCE is impaired in any significant way due to the absence of grizzly bears. GBDEIS2 presents no evidence of significant impairment of the ecological functions of the NCE arising from the absence of Grizzly bears. Our previous comments related to this topic remain valid and have largely been ignored in GBDEIS2.

4. Taking action at this time to introduce Grizzly Bears in to the NCE given the need to update important plans is premature. GBDEIS2 repeats the statements made in GBDEIS1 that the Grizzly bear has been extirpated or never existed is beside the point in the end however as ", the FWS also acknowledge[s] there is no longer a population present in the ecosystem." (GBDEIS Pg. 6).

As there is no immediate imperative to implement a restoration plan, action should instead be taken to update the 24-year-old 1993 Grizzly Bear Plan (including the NCE Chapter added to the Plan in 1997) to validate that restoration of the Grizzly population in the NCE to recover the grizzly bear population in the coterminous United States. Section 4(c)(2) of the Endangered Species Act requires that "at least once" every 5 years USFWS [in this case] complete a review of listed species. The last such review for the grizzly bear was completed in August 2011. This review recommended, among other things, that the 1993 Recovery Plan itself be revised:

Except for the GYA, the recovery plan and associated recovery criteria have not been updated since the plan was released in 1993 and supplemented in 1996 and 1997 with chapters for the BE and NCASC [North Cascades Ecosystem] respectively. Thus, the plan no longer reflects the best available and most up-to-date information on the biology of the species and its habitat. We are now in the process of updating the recovery plan [emphasis added] (Pg. 14).

Other key plans driving a consideration of the reintroduction of grizzly bears, or that could be significantly affected by such reintroduction, are also dated. The Forest Plans, which apply to 74% of the federal lands within the NCE, are even older - the Okanogan Forest Plan was approved in 1989, the Mt. Baker-Snoqualmie and Wenatchee Plans both in 1990. Based on the increases in the number of grizzly bears in other recovery areas, it appears that the opposite conclusion, namely that reintroduction of grizzly bears in the NCE is not necessary may be true. We believe that continued focus on the recovery areas where grizzly bear populations are growing and/or taking action in the BE, where a Record of Decision for augmentation of grizzly bears is already in place, is where the priorities should more appropriately lie.

At the end of the day, it defies common sense that a complicated and still controversial and when all economic aspects are considered, costly restoration plan should be implemented at this time when the very basis and need for it is not affirmed by current information and updated plans.

Please do not hesitate to contact me if you have any questions have any questions about this letter or our previous filing of April 25, 2017.

Sincerely,

Chair, DARA

RE: Comments on the Grizzly Bear Restoration Plan DEIS (GBDEIS)

Dear Superintendent Taylor-Goodrich:

Darrington Area Resources Advocates (DARA) is a volunteer group comprised of Darrington citizens, representatives of the Sauk-Suiattle Tribe and Hampton Mills, business owners, backcountry horsemen and others whose overall goal is to support programs and projects which capitalize on and promote the sustainable use and enjoyment of natural, recreational and historical resources which abound in the vicinity of Darrington.

We have completed a review of the GBDEIS and recommend that work cease on preparing the FEIS and issuing a Record of Decision (ROD) until the USFWS has completed the 5-year review for the grizzly bear as required by Section 4(c)(2) of the Endangered Species Act (ESA). The last such review was completed in August, 2011 and among other things recommended that the 1993 Grizzly Bear Recovery Plan itself be revised: "Except for the GYA [Greater Yellowstone Area], the recovery plan and associated recovery criteria have not been updated since the plan was released in 1993 and supplemented in 1996 and 1997 with chapters for the Bitterroot Ecosystem (BE) and NCASC [North Cascades Ecosystem, hereafter NCE] respectively. Thus, the plan no longer reflects the best available and most up-to-date information on the biology of the species and its habitat" [emphasis added] (Pg. 14).

The DEIS states: "Because there has been no confirmed evidence of grizzly bears within the NCE in the United States since 1996 (IGBC NCE Subcommittee 2016), any remaining bears in the NCE do not meet the accepted definition for a population (i.e., evidence of 2 adult females with cubs or 1 adult female tracked through two litters)" (FWS 2000a) (Pg. i). Based on this same information "Grizzly bears thus have been functionally extirpated in the North Cascades Ecosystem" (Appendix F-2). We agree with this assessment and submit therefore, that there is no "emergency" need to move forward with an FEIS until the 1993 Recovery Plan has been updated and the 2016 5-year Summary that is now overdue is completed. Information from this update and the revision of the 1993 Recovery Plan should be included in the FEIS if it is decided to move forward with it. We take this matter up in detail in Enclosure 1. In the alternative, we recommend that the ROD for the FEIS adopt the No-Action Alternative for the reasons summarized below which are described in detail in Enclosure I.

We want to make it clear that our taking this view in no way represents a lack of concern for the recovery and establishment of viable and delisted populations of the grizzly bear in the coterminous United States. We believe that at the present time, the risk of extinction of the grizzly bear is remote, success of ongoing recovery efforts is well documented, and that further recovery efforts should remain focused on the recovery areas where documented and growing populations of grizzly bears exist.

1. The GBDEIS does not present compelling evidence that a substantial grizzly bear population ever existed in the NCE.

The evidence supporting the premise that the NCE ever supported a substantial population of grizzly bears is, upon close examination, lacking. Historical grizzly bear hide counts frequently cited in the DEIS were taken at Hudson Bay Company posts well outside of the NCE. Other studies or historical documents relied on by the DEIS state that the majority of the relatively few grizzly bear sightings are based on unconfirmed reports.

2. The DEIS presents no evidence that the NCE is impaired in any way due to the absence of grizzly bears nor does it address in any substantive way impacts to listed salmonid species that occupy habitat within and adjacent to the NCE.

Other than stating the NCE is not "complete" without a grizzly bear population, the DEIS does not describe any ecosystem function or population that is impaired or imbalanced because grizzly bears are absent. In Yellowstone for example, it was documented that overpopulation of elk was leading to destruction of riparian areas which was corrected when wolves were introduced. There is no similar or other ecological imbalance in the NCE that would be corrected by the reintroduction of grizzly bears. On the other hand, the DEIS does not support with any substantive data its assertion that reintroduction of grizzly bears will not adversely impact listed salmonids that spawn in rivers and streams within and adjacent to the NCE. The absence of well supported analysis with respect to the impacts of the target grizzly population of 200 or more on these fish is

especially glaring.

The DEIS does not describe in any detail at all the likely behavior and movement of introduced grizzly bears initially and over time as the population would increase under the action alternatives and as they adapt to site specific food sources and habitat in the NCE. The DEIS does not address the likely need to restrict access to and recreational use within the NCE nor the likely movement of bears into lowland areas in the spring and fall on the west side in search of fish and on the east side in search of low hanging fruit.

3. The DEIS does not describe a compelling essential need to reintroduce grizzly bears into the NCE at this time based on the current status of the species in the coterminous United States and nearby robust grizzly bear populations in British Columbia.

Unlike the NCE, there are documented viable populations of grizzly bears in the other recovery areas. Grizzly bear populations are growing in the Great Yellowstone Ecosystem (where it has been proposed to delist the species, March 2016) and the Northern Continental Divide Ecosystem (1000 bears and growing, 2016) where a draft conservation plan has been released. In the Selkirk Ecosystem (80 bears in 2012) and Cabinet-Yak Ecosystem (48-50 bears in 2016) populations are also increasing. The up to \$8 million proposed for expenditure in the NCE to reintroduce grizzly bears would be far better spent in these other ecosystems. The DEIS has abundant narrative regarding "wilderness" and that reintroducing grizzly bears is necessary to fulfill the purposes of the Wilderness Act. This may be a desirable outcome for wilderness advocates but to our knowledge, is not required by the statute or related case law. The absence of grizzly bears did not prevent the wilderness designations within the NCE in the first place nor is their presence necessary to maintain their character or preserve their designation. We believe the focus of grizzly bear recovery should remain on other areas with documented populations at least until the 1993 Recovery Plan is updated and the 5-year Summary for grizzly bears is completed.

4. Local communities within and surrounding the NCE may be adversely impacted by introduced grizzly Bears who likely will roam off federal lands onto low elevation private lands within and adjacent to the NCE.

The DEIS describes two potential socio-economic benefits related to reintroduction of grizzly bears into the NCE. The first benefit is that reintroduction may increase tourism and associated revenue to Gateway Communities but the DEIS provides no published evidence supporting this assertion at all and no quantification of increased revenues. The North Cascades National Park is the 2nd least visited National Park in the country and less than 30,000 people visit the backcountry where grizzly bears might be seen if reintroduced. The DEIS falsely represents traffic over the North Cascades Highway as "visits" to the National Park. The second benefit is that people will take satisfaction "knowing that grizzly bears are there" in the ecosystem which unsurprisingly is not measurable in any economic sense that is supported by published evidence cited to in the DEIS.

The description in the DEIS of economic losses associated with livestock or other resources, restrictions on access, and other "encumbrances" that come with a listed species is understated and unnecessarily qualitative particularly with respect as to how impacts will change as the grizzly population grows towards the restoration goal of 200 or more bears. The premise that livestock losses, for example, can be offset by compensation relies on the State, not any commitment of federal resources to guarantee such compensation and thus is not "reasonably foreseeable" mitigation measure.

The DEIS describes only the short-term management considerations or restrictions (e.g. road or trail closures) associated with helicopter operations to insert grizzly bears into the NCE. Discussion of long term management restrictions to use and access (especially of popular trails which penetrate the heart of the NCE) areas that become occupied by grizzly bears such as those now in place in Yellowstone National Park is absent or so "qualitative" in nature that it is useless with respect to any quantification of actual impacts and evaluation of alternatives.

5. The March 10, 2017 Letter filed by the Sauk-Suiattle Indian Tribe (SSIT).

We support and adopt the views taken by the SSIT in their comment letter of March 10, 2017. The SSIT addresses better than we ever could the flaws in the Ethnographic Sections of the DEIS and the importance of salmon historically and presently to the Tribe.

6. Other

A general concern we have with the DEIS is that it appears to have been prepared without significant involvement of USDA Forest Service Staff. National Forest System lands managed by the Okanogan-Wenatchee and Mt. Baker-Snoqualmie National Forests comprise 74% of the NCE and the plans for these forests are not mentioned at all as being relevant to the decision to reintroduce grizzly bears into the NCE (DEIS, Pg. 14).

Finally, we offer the following without malice. A recent article about the use of best available science (BAS) related to implementation of the ESA states:

There no doubt is a mismatch between the considerable expectations imposed on the federal wildlife agencies in meeting the objectives of the ESA and the resources provided them to do so. This is compounded by uncertainties regarding listed species, their habitats, and the ecosystems that support them. But too frequently the agencies base formal determinations, decisions, and findings on assertion and surmise, rather than on the best available science. They argue that data limitations and time constraints make it impossible to meet the best available science directive from Congress, and sympathetic courts to give them a free pass. This recurs repeatedly even in those circumstances where agency decisions involve species actually on the brink of extinction, or where agency actions have demonstrated impacts on sensitive sectors or subsectors of the economy. Surely the wildlife agencies are challenged to make defensible determinations, but even where the agencies have access to pertinent scientific information they may use that information in applications beyond which it is valid, selectively use data to support predetermined management responses, and employ proxy measures and surrogates without validation.

Our review of the DEIS indicates that the assertions in this article are largely true as they apply to the DEIS. We have provided citations to studies or literature which should have been considered and cited to in the DEIS in the interest of fair disclosure. More than 30 paid staff were involved in the preparation and review of the DEIS and it is their professional and ethical responsibility to use the best available science to establish and disclose without bias the implications of reintroducing grizzly bears in the NCE over the short, and particularly, the long term.

The decision to reintroduce grizzly bears in this huge area of Washington State is a major one that has impacts that will extend hundreds of years beyond the impacts of the helicopter operations that will bring the bears back into the NCE. The actual impacts of what this means, based on the BAS should have been disclosed in the DEIS and was not. It must be in the FEIS.

Please do not hesitate to contact me by phone (306-322-4817) or by email (waltdortch@gmail.com) if you have questions about the material we have provided here. Given the inability to file this document with its graphics intact via the on-line system, it has been filed in hard copy at the NPS Offices in Sedro Wooley. We are happy to provide an electronic version upon request.

Sincerely,

ENCLOSURE I
DARA COMMENTS
GRIZZLY BEAR RESTORATION DEIS

1. THE GBDEIS DOES NOT PRESENT COMPELLING EVIDENCE THAT A SUBSTANTIAL POPULATION GRIZZLY BEAR POPULATION EVER EXISTED IN THE NORTH CASCADES ECOSYSTEM (NCE).

The DEIS relies on several sources to support the assertion that the NCE once supported a "substantial" grizzly bear population. However, a review of these sources does not, on close examination, provide a basis for this assertion. In fact, these sources more strongly suggest the absence of a substantial grizzly population.

The DEIS says (Pg. 42): "At the height of the fur trade from 1820 to 1860, the Hudson's Bay Company documented 3,788 grizzly bear hides shipped from trading posts in the North Cascades region, and the last documented grizzly bear killed in the area was shot in Fisher Creek in 1967 [Emphasis added], (Sullivan 1983)."

Sullivan 1983 says (Pg. 2): At the height of the fur [sic] trade, especially during the period 1820-1860, the Hudson's Bay Company kept accurate records of all pelts taken at each of their trading posts, including three in present day Washington and one in southern British Columbia. An examination of these records shows that the market [sic] for bear hides increased after 1840 and the number passing through each outpost consecutively [sic] rose. Peak years at the various posts were: Fort Colville, 382 grizzly bear hides in 1849; Fort Nez Perce (Walla Walla), 32 hides in 1846; Thompson's River (B.C.), 11 hides in 1851. Four hides were also taken at Fort Nisqually [sic] (near Tacoma) during the period. Unfortunately, the trading areas of these posts overlap the present boundaries of Washington and it is not possible to say how many of these bears were taken in the state [emphasis added].

Note that the DEIS states 3788 hides shipped but that number is not found in Sullivan. This number appears to have originated in the "North Cascades Ecosystem Recovery Plan Chapter." In Grizzly Bear Recovery Plan Supplement. June 23, 1997 (NCRP) (Pg. 2, excerpt below). The WDFW files cited to are not referenced in the References Section of the Chapter and could not be located at the time of this writing.

Map 1.

Location of Hudson Bay Company (HBC) Posts Where Grizzly Bear Hides were Recorded

Location of Hudson Bay Posts in Sullivan (1983) and NCRP (1997) 1-Thompson River (now Kamloops), 11 hides, (NCRP 75 hides) 2 - Fort Colville, 382 hides (NCRP 3477 hides), 3 - Walla Walla, 32 hides (NCRP 236 hides), 4 - Fort Nisqually, 4 hides (NCRP 0). None of these posts are within the NCE and arguably none are in the North Cascades Region. Using Glacier Peak as a center point for the NCE it is 160 miles from there to Colville, 207 miles to Walla Walla, 180 miles to Kamloops and 104 miles to Nisqually.

By offering this statement, the DEIS intends for the reader to conclude that these hides were taken from within NCE region with an unstated but very significant inference that hides taken from the region might be from within the NCE itself. The problem here is that there is no evidence is provided that states where or when the bears were killed, only where their hides

turned up. Nor is there any discussion of the historical catchment area of these individual HBC posts. Absent these data points, these hides could have come from almost anywhere in the area formed by present day WA, MN, WY, ID, OR, BC, or Alberta

The DEIS then states that various reports document a substantial population of grizzly bears in the NCE.

DEIS says (Pg. 42): The NCE historically supported a substantial grizzly bear population, according to records compiled by Bjorklund (1980), Sullivan (1983), Almack et al. (1993), and others.

DEIS says (Pg. 42): Bjorklund (1980) summarized and mapped 16 historical (prior to 1950) and 14 recent (1950-1980) grizzly bear observations in the NCE; however, he did not distinguish between confirmed and unconfirmed observations

DEIS says (Pg. 42): More reliable results come from Sullivan (1983), who interviewed 346 people claiming to observe grizzly bears in the NCE. He estimated that the sum of these attestations amounted to approximately 100 individual human-grizzly bear encounters spanning 130 years.

Sullivan's report says this:

Pg. 3

Pg. 7

Pg. 4 Class 1 reports

Pg. 4: For Class 2-4 reports:

Pg. 5

In our view, Sullivan's data does not provide solid evidence of a substantial population of grizzly bears in the NCE. He documents only 12 class 1 reports of grizzly bears from 1900-1967, 8 of which are on the eastern edge of the NCE and one within Manning Park. A careful review of Table 2 of his report suggests that his comment that including many of the Class 2 and some of the Class 3 and 4 reports would produce a record of 100 observations is suspect based on his own warnings about the reliability of the data) but does even that number establish documentation of a substantial population? 100

observations over a period of 130 years within a 9,800-square mile seems to document a very insubstantial population. Finally, it is reasonable to think that hunters and hikers have been carrying cameras into the NCE for many decades and that if there were many bears at all there would be pictures of them taken since 1967 particularly in the well trailed and open east side of the NCE.

Bjorklund says:

(Introduction):

Bjorklund (Introduction):

Bjorklund Observation No. 4 (cited below as almost certainly establishing a viable population in the North Cascades:

A fundamental problem with relying on Bjorklund in general and in particular with respect to this citation given its use below is that, as stated in his introduction, "the reliability of observers and accuracy of accounts is not analyzed at this time." It is not unreasonable to ask whether the 1887 report of Albert Rogers was made by a sober, reliable, and knowledgeable individual with no motivation to exaggerate, or falsify his information? What did he say or write, to whom, when, and why? The statement says "sighted." Not "reported";... so how was this information from Rogers transmitted, documented, and verified?

Finally, Bjorklund makes this statement (Pg. 7):

Based on the Class 1 standard used by Sullivan and Almack only 1 of the 31 Bjorklund observations is a certain Class 1 (Rocky's kill at Fisher Creek), 3 others may be (kills) 1913, 1923, 1953 (all cited to Majors which we have not been able to review). Hardly documentation of a substantial population. Note too, that Observation 4 (in 1887) cited by Bjorklund as evidence of a viable population in the NCE is not even a Class 1 observation.

The DEIS citing to Bjorklund as establishing evidence of a substantial and viable population of grizzly bears in the NCE is unreasonable at best.

Almack says Pg. 21:

The Almack observations are displayed in Tables 1-4 beginning on page 33 of his report.

Class 1 and 2 observations are defined as (Pg. 5):

Almack et al 1993 Pg. ii.

Almack Pg. 74. No bears were trapped during the study period.

Almack Pg. 75. No bears were photographed at these sites during the study.

Almack Observations (from Tables 2 and 3 beginning on Pg. 33)

Class 1 Observations total 22, 1 in 1859 and 21 from 1964-1991. 11 of these were bears (the others tracks a food cache and a skull). Of the 11 bear observations 3 were in BC, 3 near Winthrop, 1 in the North portion of the NCNP, 2 near Cle Elum, 1 near Chelan and 1 on the Nooksack River (1859).

Class 2 Observations total 82, 1 in 1859, 81 from 1964-1991). 76 of these were bears (the others tracks and digs). Of the 82 bear observations 21 were near Winthrop, 8 near Cle Elum, 7 near Twisp, 6 in BC, 4 near Chelan, 4 near Entiat, 4 near Ross Lake, 3 near Darrington, 3 in the North portion of the NCNP, 3 near Skykomish, 2 in the South Portion of the NCNP, 2 near White River, 1 near the Stehekin Road, 1 in Kittitas County and 1 near Packwood.

Assuming, arguendo, that all the Class 1 and Class 2 observations are valid does not significantly bolster the already weak conclusions from Sullivan. 102 observations during a 27-year period in a 9,800-square mile area when people are generally carrying cameras and backcountry use is increasing dramatically does not add up to a convincing argument there were many bears in the NCE during this period at all and the majority of those that might have been were on the eastern edge of the NCE.

Finally, Almack concludes this with respect to the observations presented in the report (Pg. 21):

This sweeping conclusion is based on 2 observations described in Table 2 of the Almack Report:

Observation 12 (1988) Video of 2 adults near Cle Elum; and,
Observation 20(a) (1991) Observation of 1 adult and 1 cub near Chelan.

The comments above for Bjorklund regarding the confirmation of the reliability of the reports to begin with apply here as well. The age of the cub in Observation 20(a) is not established and depending on the age of this animal could have come from BC or somewhere else outside of the NCE. In any case, it is hardly credible to cite these two observations as establishing that a "widely-distributed and reproducing grizzly population" is present in the NCE.

DEIS says (Pg. 43): These earlier [Historical] accounts indicate that grizzly bears existed historically throughout the Cascade Mountains and likely inhabited the coastal regions of Washington and Oregon (Almack et al. 1993).

Almack et al (1993) says (Pg.2):

Almack notes an absence of observation of grizzly bears based on historical expedition journals.

As to west side occupation, while Almack describes Custer killing a Grizzly bear on the Nooksack and observing others he goes on to state (Pg. 2):

We have yet to find actual evidence supporting what Almack admits is an impression that grizzly occupied the west slope of the NCE (see discussion of Underhill (Collins) below).

Almack then describes that miners then "poured" into the North Cascades

The intent here is to establish that miners "pouring into the North Cascades" created the "second major impact" on the survival of grizzly bears in the North Cascades [the first being the trapping discussed above]. This conclusion however is based on uncited "second-hand information" and a single personal communication with D. Tresch in 1986.

Almack next describes the "rapid human encroachment" which followed the "mining invasion" of the North Cascades which though unstated must be interpreted to be the 3rd and final major impact on the grizzly bear population in the NCE.

The image presented here of massive trapping, the mining invasion, and rapid human encroachment, while dramatic, is misleading at best with respect to its influence on the still pristine core area of the NCE which was not massively trapped, invaded by miners or waves of humans and thousands of sheep, military expeditions or boom towns. As noted in the DEIS at Pg. 69: "Almack et al. (1993) and Gaines et al. (1994) mapped out areas of human activity in the NCE including roads, timber operations, livestock grazing, population centers, campgrounds, and other recreation areas (e.g., ski areas, air strips, etc.). Both studies found that the majority of the NCE (68%) was free of open roads; only small portions of Okanogan-Wenatchee National Forest were grazed (11% for Okanogan and 3% for Wenatchee); and a small percentage (4%) of the area in the NCE was within a large zone of influence around population centers and other areas." The basic question that arises here is this. If in fact (as it appears to be) that a substantial grizzly bear population in the NCE was not trapped out, killed by miners or rapid human encroachment where did they go? A plausible answer is that was never a substantial population of grizzly bears in the NCE.

DEIS says (pg. 42): In addition to records of pelts, other evidence of historical grizzly bear presence in the NCE is found in writings about Native Americans, early USFS history, and the archaeological record (Underhill 1945).

The DEIS does not provide citations to early USFS History. The reference to Underhill 1945 is described as Valley of the Spirits: The Upper Skagit Indians of Western Washington. p 52. (DEIS Pg. 184).

Underhill says (Pg 52):

This is the only place grizzly bears are mentioned in this book and hardly documentation of a substantial grizzly population, hunting success or evidence grizzly bears were a significant part of Indian culture or diet.

We reviewed Ms. Underhill's other book Indians of the Pacific Northwest, US Department of the Interior, 1944. There is one reference to grizzly bears: "The coast of British Columbia and southern Alaska is, say the animal men, the bear center of the world. It has more bears than any other place in either hemisphere and the coasts of Washington and Oregon, on its fringe, are a close second. The bears are mostly of the black (or really brown), not so fierce as a grizzly and interested mostly in salmon and berries" (Pg. 51).

DEIS says (Pg. 42): Lastly, five Holocene archaeological sites in eastern Washington have produced grizzly bear remains that could be evidence of prehistoric grizzly populations in the nearby mountains of the NCE (Lyman 1986).

It is not clear how this is relevant, interesting nonetheless that the DEIS states it could be evidence of grizzly bear populations in nearby mountains. Perhaps the Selkirks? Hardly conclusive about anything in the NCE.

Conclusion

Close examination of the references cited in the DEIS which purport to establish that a substantial population of grizzly bears in the NCE was extirpated by trappers, miners and other rapid encroachment by humans produces a very reasonable doubt that this sequence of events is true for the NCE. The FEIS should address this weakness and provide the rationale for accepting as documenting a substantial population of grizzly bears occupied the NCE historically and have been extirpated by the influences of man.

2. THE DEIS PRESENTS NO EVIDENCE THAT THE NCE IS IMPAIRED IN ANY WAY DUE TO THE ABSENCE OF GRIZZLY BEARS NOR DOES IT ADDRESS IN ANY SUBSTANTIVE WAY THE IMPACTS TO LISTED SALMONID SPECIES THAT OCCUPY HABITAT WITHIN THE NCE.

There are three key questions that should be central in the decision to move forward with the reintroduction of grizzly bears into the NCE.

Question 1. Whether grizzly bear reintroduction is necessary to prevent the extinction of grizzly bears and/or is essential to species recovery in the coterminous United States.

In our view, the answer to this question presently is no. See our comments on Issue 3.

Question 2. Whether that the NCE ecosystem is impaired in any way due to the absence of grizzly bears.

We believe the answer to this question is also no. The DEIS presents no substantial evidence that the ecological condition or function of the NCE is impaired due to the absence of the grizzly bears. Specific DEIS ecosystem comments consist of the following:

DEIS Pg. vii: "The reestablishment of grizzly bears as part of the ecosystem would result in improved ecosystem health over the long term."

This statement is made in varying ways in several places in the DEIS. We find no substantive discussion or supporting evidence in the DEIS that the ecological health of the NCE is impaired due to the absence of grizzly bears.

DEIS Pg. (PDF): viii: "Release of grizzly bears would result in lasting beneficial impacts on wilderness character by restoring a native species that has not had a viable population in the NCE in many years."

We submit that wilderness character is not an ecological consideration per se, rather a human psychological matter; essentially a value judgement. The DEIS does not describe any ecological benefit related to wilderness character. Instead it suggests human psychological benefits that may be an important to some (see, for example, DEIS Pg. 3). However, these alleged benefits are not ecological benefits or factors that have a bearing on the recovery of the grizzly bear in the NCE; or anywhere else for that matter.

DEIS App F-6: "Restoration of this species would therefore restore a significant aspect of the natural processes of ecological systems within the Glacier Peak, Pasayten and Stephen Mather Wildernesses to a state in which they are substantially free from the effects of modern civilization. This restoration is therefore necessary to administer these wilderness areas as wilderness."

Again, the DEIS provides no evidence with regard as to whether reintroduction of the grizzly would restore any impaired species or ecological function in the entire NCE (not just wilderness) other than the vague and unsubstantiated statement quoted above. The assertion that reintroduction is necessary to "administer the wilderness areas as wilderness" has no basis in the Wilderness Act itself which establishes no substantive requirements on the administering agency to reintroduce species of any kind in wilderness. While this might desirable to some, it is not a requirement of either the Wilderness Act or the ESA.

Question 3. Whether reintroduction of grizzly bears will impede the recovery of listed salmonids that are dependent upon habitat within or adjacent to the NCE.

The answer to this question is yes.

The historical importance of salmon in the life and culture of "west side" Indian tribes is well documented and, unlike the inferences of the importance of grizzly bears to these tribes as asserted in the DEIS, indisputably documented. The economic value of the salmon fishery, both commercial and recreational in 2006 was \$135 million. The State of Washington is making substantial and sustained investments to restore, maintain, or enhance salmon populations. The Recreation and Conservation Office of Washington State alone invested over \$800 million in such efforts between 1997-2015. Presently listed salmon species and their general location within or adjacent to the NCE are shown in the map below.

Map 2.

The stream reaches that provide spawning habit for these species within or adjacent to the NCE could be displayed by overlaying the boundary of the NCE on the map below, which we have not had the time to do.

Map 3.

Even without such an overlay, a visual comparison of this map to the map above and the DARA map below begins to tell the story of the overlap of typical grizzly bear range with habitat occupied by listed fish. It seems obvious that a DEIS addressing the ecosystem of the NCE should address this in detail, but it does not. Instead the DEIS concludes, without citing substantial evidence of any kind, that reintroduction of grizzly bears in the NCE will have no significant impacts to listed fish in the short, and much more importantly, long term. More significantly, the DEIS appears to deliberately exclude, or at least was prepared in ignorance of, existing scientific information which contradicts the DEIS' "qualitative" conclusions shown below.

Map 4.

The DEIS states that "It is difficult to predict where bears might move; therefore, areas outside the NCE are described generally for resources that could be affected by bear movements and behavior or associated management actions" (DEIS Pg. 3).

As noted above and elsewhere, this assertion is used to avoid describing what bears will likely do once inserted into the NCE itself and, in wandering outside of the NCE, what areas they will likely occupy and what they will likely forage for despite a monumental quantity of verified scientific data that could address these questions more precisely as our range map above begins to depict. In short, the DEIS does not describe in any substantive and scientifically supported way the behavior and impacts (good or bad) that reintroduction of grizzly bears will have on the NCE ecosystem. Mapping of the location of seasonal food sources, in this case for example, salmon spawning habitat within and adjacent to the NCE, would inform how likely it would be that grizzly bears will be attracted to such locations. Despite all these seemingly obvious questions and the easily accessible information to fairly address and disclose them, the DEIS instead offers the following:

DEIS Pg. (PDF) vii and 110: "Fish are not expected to be a primary food source for grizzly bears, and the number of grizzly bears in the ecosystem would not be sufficient to generate any adverse impacts on fish populations as a result of predation."

There are no citations to scientific or commercial information within the DEIS which supports this statement. The documentation of grizzly bears feeding on fish when they are available is extensive and spectacularly ignored in the DEIS. Our citation to the opportunistic feeding behavior when a similar conclusion is asserted for livestock depredation in the DEIS is repeated here: "The Grizzly Bear 5-year Evaluation and Summary states: 'Grizzly bears display great diet plasticity and switch food habits according to which foods are available' (USFWS August, 2011, Pg. 24).

DEIS Pg. 108:

Under alternative C, grizzly bear restoration activities would not involve any disturbance of fish habitat. In the short term, the number of grizzly bears in the ecosystem would be very small, and the population is expected to remain confined to the northern portion of the NCE for at least the first several decades following initial restoration activities. While it is possible that grizzly bears, as opportunistic omnivores, could use fish as a food source, fish are not expected to be a primary food source and the number of grizzly bears present in the ecosystem would not be sufficient to create any pressure on fish populations as a result of predation [emphasis added].

Here, again the DEIS offers no citation to scientific or commercial information which supports this statement. It is documented, of course, that grizzly bears feed on salmon and that they quickly learn to catch them efficiently at river bottlenecks in Alaska and, in our case, would likely do the same at salmon spawning sites restored in many areas within and adjacent to the NCE at considerable cost. It is also documented that the primary food sources of grizzly bears change over the seasons and that a primary food source for grizzly bears in temperate rain forests is salmon (No citation is provided here because the authors of the DEIS know this very well!). The DEIS should explain what action will be taken, and by whom and at what cost when grizzly bears (like Herschel the infamous sea lion) eventually begin to prey on salmon in such "gravy train" feeding locations.

DEIS Pg. 110:

Under alternative D, long-term impacts on fish from grizzly bear restoration activities would be essentially the same as those described for alternative C. Initial restoration activities would not involve any disturbance of fish habitat. The number of grizzly bears in the ecosystem is expected to grow more rapidly than under alternative C; however, fish are not expected to be a primary grizzly bear food source in the NCE, and the number of grizzly bears in the ecosystem in the first one to two decades would not be sufficient to generate any substantial short-term adverse impacts on fish populations as a result of predation.

Our comment made above applies again here. No scientific or commercial information is cited in the DEIS (and plenty of such data exists that contradicts it) to support this "qualitative" assertion.

Conclusion: The FEIS, if it is issued, should address this major flaw in the DEIS and fully disclose, in a level of detail that is supported by habitat mapping and the BSA the short and long term impacts to listed fish that will arise with the creation of a population of more than 200 grizzly bears in the NCE.

3. THE DEIS DOES NOT DESCRIBE A COMPELLING AND ESSENTIAL NEED TO REINTRODUCE GRIZLY BEARS INTO THE NCE AT THIS TIME BASED ON THE CURRENT STATUS OF THE SPECIES IN THE COTERMINOUS UNITED STATES.

The DEIS states on Pg. 42 that the USFWS, in its EIS for grizzly bear recovery in the Bitterroot Ecosystem, defined a minimal existing grizzly bear population as one that was established by:

verified evidence within the previous 6 years, consisting of photos within the area, verified tracks and/or sightings by reputable scientists or agency personnel, of at least two different female grizzly bears with young or one female seen with different litters in two different years in an area geographically distinct from other grizzly bear populations. Verifiable evidence of females with young, to be geographically distinct, would have to occur greater than 10 miles from the nearest non-experimental grizzly bear population recovery zone boundary (FWS 1993a).

The DEIS also states there have been few confirmed siting's of grizzly bears in recent decades in the NCE on either side of the border and that efforts to obtain grizzly bear samples at various periods from 1998-2013 within high quality grizzly bear habitat (including 23% of the U.S. portion of the NCE) detected 1 female bear. The DEIS concludes: "Based on the information gathered to date in the NCE, there is no evidence to support the conclusion that there is a population of grizzly bears in the ecosystem, as defined above" (DEIS Pg. 42). Appendix F-2 of the DEIS states that based on this same information: "Grizzly bears thus have been functionally extirpated in the North Cascades Ecosystem." We agree with this assessment and submit, based on this same information, that there is no need to take urgent "triage" action to airlift grizzly bears into the NCE at this time.

Action should instead be taken to update the 24-year-old 1993 Grizzly Bear Plan (including the NCE Chapter added to the Plan in 1997) and to attempt to validate the DEIS' conclusion that reintroduction of grizzly bears into the NCE is still necessary to recover the grizzly bear population in the coterminous United States. Other key plans driving a consideration of the reintroduction of grizzly bears, or that could be significantly affected by such reintroduction, are also dated. As noted, the Grizzly Bear Recovery Plan is 24 years old. The Forest Plans, which apply to 74% of the federal lands within the NCE, are even older - the Okanogan Forest Plan was approved in 1989, the Mt. Baker-Snoqualmie and Wenatchee Plans both in 1990.

Map 5.
Recovery Areas

Table 1.
1993 vs 2017 Grizzly Bear Distribution in US Recovery Areas

Recovery Area	1993 Grizzly Population	2016 Grizzly Population	2016 ESA Status
GYE	236	757 and growing	Proposed for de-listing
NCDE	549-813	1000 and growing	Delisting process underway (Conservation Plan drafted and NF Management Plans under amendment)
CYE	Less than 15	48-50	Threatened
SE	26-36	80	Threatened
BE	Unknown	Unknown (estimate 0)	Threatened
NCE	Not estimated (Almack 1993 says 10-20)	DEIS says no longer a population	Threatened

The DEIS states:

The eventual loss of grizzly bears from the NCE would continue to put pressure on the species, reducing the likelihood of achieving recovery under the ESA. Although cumulative actions may provide benefits to grizzly bear habitat, the existing very low estimate of bears in the NCE and the decision under alternative A not to restore them would contribute substantially to overall adverse cumulative impacts on grizzly bears. (Pg. 124).

As with many assertions in the DEIS, there is no reference to studies or analysis that describe what is meant by "pressure on the species" or that support the statement that no action in the NCE to reintroduce bears would "contribute substantially to overall adverse cumulative impacts on grizzly bears."

In fact, based on the increases in the number of grizzly bears in other recovery areas, it appears that the opposite conclusion,

namely that reintroduction of grizzly bears in the NCE is not necessary, could just as easily (and more defensibly) be made. Instead perhaps, continued focus on the recovery areas where grizzly bear populations are growing and/or taking action in the BE, where a Record of Decision for augmentation of grizzly bears is already in place, is where the priorities should more appropriately lie.

The best time to take up these questions is before, not after, millions of Federal taxpayer dollars are spent and the lives of the bears themselves are perhaps lost in an ill-considered effort to reintroduce them into the NCE. And the best way to address these questions is to revise the 1993 Recovery Plan and complete the 5-year Grizzly Bear Summary required by the ESA - both of which are now overdue.

Section 4(c)(2) of the Endangered Species Act requires that "at least once" every 5 years USFWS [in this case] complete a review of listed species. The last such review for the grizzly bear was completed in August, 2011. This review recommended, among other things, that the 1993 Recovery Plan itself be revised:

Except for the GYA, the recovery plan and associated recovery criteria have not been updated since the plan was released in 1993 and supplemented in 1996 and 1997 with chapters for the BE and NCASC [North Cascades Ecosystem] respectively. Thus, the plan no longer reflects the best available and most up-to-date information on the biology of the species and its habitat. We are now in the process of updating the recovery plan [emphasis added] (Pg. 14).

We inquired of USFWS staff (March 8, 2017) as to the status of the 2016 5-year plan. Their response was: "We are not currently working on a new 5-year review. Other high priority grizzly bear efforts have exhausted our capacity at this time. I do not have an estimate of when we will be able to dedicate time and personnel toward completing a new review."

In 2012, there were 15,000 grizzly bears in south-central British Columbia (DEIS Pg. 47). While the DEIS describes that the NCE is isolated from this population it does not discuss its ecological connection with the SE, CYE or NCDE Recovery Areas as shown in Map 5. The 2011 5-year summary does take up the Canadian grizzly population and states on Pg. 7:

Continuing, the 2011 5-year summary states on Pg. 8:

So, "while there is no evidence of "marked biological separation between grizzly populations across the international border between the lower 48 states and Canada," USFWS concludes that based on the "best scientific information" that differences in control of exploitation and regulatory requirements place the Canadian population of grizzly bears in higher risk than their American siblings because they are not protected under something like the ESA. And because of this, should be ignored in consideration of whether the populations they are connected to in the United States could be delisted accordingly. We submit that if there actually was evidence the Canadians were mismanaging their robust populations on their side of the border in 2011 it would have been cited in this summary. None is. The DEIS, on the other hand, says this on Pg. 47:

The current range of grizzly bears in British Columbia has been divided into 56 grizzly bear population units (GBPUs) that delineate individual grizzly bear populations for conservation and management... Each GBPU has been assigned a conservation status of either Threatened or Viable. The objective for the nine Threatened GBPUs in British Columbia is population recovery to prevent range contraction and ensure long-term population viability. The objectives for the remaining 47 viable GBPUs includes maintaining current population abundance and distribution, and providing sustainable harvest and viewing opportunities where appropriate [emphasis added].

We submit that this information of "good management" of Canadian grizzly bear populations in south-central BC itself warrants reconsideration and validation of what appears to have been an arbitrary demarcation between the populations in the 2011 5-year summary and that this validation be undertaken and documented in the 2016 5-year summary.

We believe that the clear priority is to revise the 1993 Recovery Plan as recommended by USFWS itself in the 2011 5-year summary and complete the overdue 2016 5-year summary. This will ensure that the best available science, and the favorable

trajectory of grizzly populations in other recovery areas (and the status and management of the BC population across the border), have been used to update the Recovery Plan. This will serve to validate that the reintroduction of grizzly bears into the NCE remains a priority for recovering the grizzly bear in the coterminous United States. As described above, there is no present species or ecosystem "emergency" related to grizzly bears in the NCE that overrides taking the time to update the 1993 Recovery Plan and produce the 2016 5-year summary.

4. LOCAL COMMUNITIES WITHIN AND SURROUNDING THE NCE MAY BE ADVERSELY IMPACTED BY REINTRODUCED GRIZZLY BEARS WHO LIKELY WILL ROAM OFF FEDERAL LANDS ONTO LOW ELEVATION PRIVATE LANDS WITHIN AND ADJACENT TO THE NCE.

The Socioeconomic Analysis (SA) in the DEIS is superficial, unnecessarily qualitative and does not adequately address or disclose potential impacts of the action alternatives. Involvement by the Forest Service appears to have been minimal despite the fact the most of the federal lands within the NCE are comprised of NFS lands (74%). The 2006 FS FEIS for the Greater Yellowstone Area provides a very good example of the scope and level of detail related to socioeconomic issues and should as a model for the level of detail that should be provided in the FEIS and considered in the ROD.

A fundamental problem in this and other sections of the DEIS (see our discussion in Issue 2) is the failure to use easily produced maps and other available information to tell the "whole story" to begin with and support the conclusions taken up in the SA. DARA modified a map (following page) in the DEIS to depict the well documented home ranges of grizzly bears and how these relate to resources or uses of lands within the NCE.

Map 6.

Maps such as this based on available information and science should have been used throughout the DEIS elsewhere in our comments and below to tell a different kind of story than, for a profound example what is told on Pg. 39 of the DEIS: It is difficult to predict where bears might move; therefore, areas outside the NCE are described generally for resources that could be affected by bear movements and behavior or associated management actions.

This statement epitomizes what is wrong in the DEIS and needs to be corrected in the FEIS. The Almack 1993 report is cited to support the DEIS assertion there was a substantial population of grizzly bear in the DEIS. That same report contains the following maps:

Almack 1993 Pg. 80

Almack 1993 Pg. 81

Superimposition of these maps onto the DARA map above shows that it is possible to predict where grizzly bears are likely to head in the spring in the NCE. Superimposing the location of foods preferred by grizzly bears throughout the year would further describe where grizzly bears are likely to be throughout the year. As described below, this same approach should have been used in a number of places in the SA in the DEIS. It begs the question why they were not and establishes the need to

provide this kind of information in the FEIS.

Turning to the SA itself, the DEIS describes the methods and assumptions used in the Socioeconomic Analysis as follows:

DEIS Pg. 145: Methods and Assumptions

The analysis of socioeconomic impacts considers potential effects on employment, population, and revenue from natural resource-related activities and revenue from park and national forest visitation that may result from grizzly bear restoration under each alternative. Impacts for this resource topic were analyzed using information on population, employment, and key regional industry sectors provided by the U.S. Census Bureau; information on the economic contribution of national park visitation in the NCE provided by the NPS; and information on timber sales and grazing leases provided by the USFS. A qualitative analysis was performed by subject matter experts based on professional judgment supported by the information described above [emphasis added].

Cited to information in the DEIS related to socioeconomics is mostly "inventory" type data (numbers of this or that) while conclusions rest nearly entirely on qualitative analysis based on professional judgement which is not described in terms of how professional judgements were made (assumptions used, etc.). No quantitative data related to changes in revenue or employment or other socioeconomic factors associated with action alternatives is presented. Qualitative conclusions which are contradicted by existing written evidence or consultation with professionals more familiar with the subject matter should be revised accordingly in the FEIS as described below. There is no substantive evaluation of the impacts associated with the reintroduction of grizzly bears related to revenue and employment. Instead, qualitative assertions are made in the narrative for Alternative B which are then "adjusted" by qualitative assertions for Alternatives C and D. The quantitative precision that exists at all in this respect relates to estimates of new NPS and USFWS staff that will be needed to implement the action alternatives and estimates of those implementation costs in Appendix D.

The SA addresses 4 components: The restoration of grizzly bears in the NCE has raised concerns about economic impacts on natural resource-based industries such as mining and logging. Concerns about depredation of livestock or agriculture, such as fruit orchards, have also been raised. In addition, revenue to local businesses may be affected due to changes in tourism and hunting revenue as a result of grizzly bear restoration (DEIS Pg. 10).

A significant flaw in the DEIS is not to address the impacts of grizzly introduction on listed salmonid species occupying habitat within and adjacent to the NCE which is taken up in our Is

Timber Harvest

The DEIS describes the impacts to Timber Harvest under Alternative B to establish the "baseline" for comparison of impacts associated with Alternatives C and D:

Leaseholders of timber lands could be adversely affected by release of grizzly bears if grizzly bears move through leased lands while leaseholders are harvesting timber. However, any timber harvest on USFS lands would be subject to ESA consultation requirements, which may allow operators to temporarily disturb bears while continuing to operate. Impacts on timber operations from grizzly bears would be temporary and intermittent because timber is not harvested all the time, timber leases are generally located along the periphery of suitable grizzly bear habitat, and grizzly bears are not expected to be on these lands all of the time. Under alternative B, there would be little to no potential for lost work hours and employment based on the small number of bears released. If a timber company chooses to temporarily stop work as the result of safety considerations of their workers, any lost time would be minimal. Any impacts could be mitigated by allowing workers to harvest other lands if available, although some small, temporary, and intermittent impacts on employment and income of site workers could be possible [emphasis added] (Pg. 149).

The DEIS describes the impacts to timber harvest under Alternatives C and D are the same as described above for mining.

The emphasized text at the close of the paragraph above is a classic example of what is wrong with the DEIS SA. There is no quantification of the area of lands on NFS that are managed for timber production that would be affected in the long or short term by the action alternatives. There is no disclosure of likely impacts to long term harvest levels under the action alternatives. The statements that impacts associated with bears walking into ongoing harvest operations could be dealt with by ESA consultation requirements and that safety issues could be mitigated by allowing workers to work on other lands if available is almost laughable in its ignorance about how harvest operations work and the cost of moving workers and

equipment around. The authors of the DEIS can and should have provided examples of where ESA consultation has allowed harvest operations to continue when a grizzly bear walks into a harvest area. The statement that some small, temporary, and intermittent impacts on employment and income of site workers could be possible does not appear to be a well-considered, documented and certainly not well supported statement at all. As described above, the FS FEIS for the GYA provides a relevant example of the level of detail that can and should be developed and disclosed in the FEIS to document impacts to activities like timber harvest.

The DARA map above shows the extent of overlap between grizzly bear range on timber management areas which should be disclosed and analyzed quantitatively in the FEIS.

Mining

The DEIS describes the impacts for Alternative B to establish the "baseline" for comparison of impacts associated with Alternatives C and D:

Similar to impacts described for timber harvests, holders of mining claims may be adversely affected if grizzly bears pass through leased lands while mining is in progress. However, because of the small number of bears released under the primary phase of alternative B and the fact that the closest mining claim is at least 15 miles from the nearest potential release area, the likelihood of these impacts would be very low. In the event that grizzly bears are present in or near mining leases, they are expected to move through in minutes to hours; therefore, these impacts are anticipated to be t

Correspondence: This is in regards to the proposed idea of reintroduction of grizzly(brown bear) population in the north cascades in WA State this includes the experimental population or restore population. 10(j) Short answer: Absolutely NO, these proposals you provided leaves out another idea Alternative A Minus the "current endangered species act" instead put in its place "create new rules". why cant this be done? especially if the bears start going over the Canadian border if a decision is made not to reintroduce but with the new rule option we can capture and relocate them if needed. I love hiking and experiencing the outdoors I have seen all kinds of wildlife in my travels, I have had close encounters with a black bear. these were surprise encounters. luckily the bear acted proper and ran away. if this was a Grizzly bear I would have been more then likely attacked. In my opinion introducing the grizzly in WA creates a guaranteed risk to life for people of WA.

Correspondence: Regarding the Draft Grizzly Bear Restoration Plan EIS, I support the No Action alternative, with a bit of a heavy heart. While trying to expand the range of this amazing bear is a noble intention, I worry that the cost in both lives of

grizzlies and humans could likely end up being higher than this plan takes into account. There is a key difference between the North Cascades Ecosystem and the other ecosystems where grizzlies already exist or were recently introduced. The amount of backpacking recreation in the NEC is very high, and has really boomed in recent years as the population in nearby Seattle, Bellingham and Washington state in general has increased dramatically. One key corridor driving a lot of this backcountry recreation is the Pacific Crest Trail, yet I could find little or no mention of the PCT in the grizzly restoration plan. Other grizzly ecosystems held up as models in the draft restoration plan do not have a comparable trail with anywhere near that amount of use. My own personal experience (having backpacked in the Glacier Peak Wilderness, Lake Chelan Sawtooths, Stephen Mather, Pasayten, Alpine Lakes, Boulder River, Henry M. Jackson for the past 30 years) is that not only has the number of thru-hikers on the PCT exploded in the past decade, but the backcountry experience level and bear-savvy of the majority of thru-hikers has declined. Privately and in volunteer backcountry ranger roles I have interacted with many, many backpackers who sleep with their food. They don't carry bear cans, and they don't even hike with any ropes or means to hang their food even when educated by uniformed agency personnel. The go-light trend in gear means most thru-hikers do not consider carrying bear cans an option -- they often don't have packs big enough to carry a can in the first place. This plan talks about sanitation and public education, but without a specific focus on the PCT, this could be a disaster for both bears and people.

The difference between other ecosystems where bears are being managed, compared to the NCE, is they are either national parks, where backcountry staffing and frontcountry messaging can be combined in a more effective way, or they are much more remote wilderness areas like the Selkirks that get way less numbers of backpackers. There is a tendency in this plan to focus on North Cascades National Park, but the glaring omission is the PCT. The plan also ignores the very understaffed (ie: almost nonexistent) backcountry ranger presence in the national forests in the NCE. Bear cans were only added as a requirement in the Mt. Baker-Snoqualmie National Forest last year for the first time, and I can tell you from personal experience that most backpackers were unaware of the new rule. The few people who knew about it were pretty lax about their hanging techniques, and the even fewer who had cans would often leave them open in camp while they wandered off to find water or dip their toes in a lake.

Many of the release points in the NCE are outside of the national park. One, the Green Mountain horse pasture, is just a few miles away in either direction from two popular car-camping campgrounds, where people are pretty lax about keeping clean camps, to put it mildly. And last year's contractor never bothered to show up, so there was no host for either of the campgrounds that could have helped educate people. This plan has no plan for the specifics of such situations, no recognition that this is a much more challenging grizzly restoration than the Selkirks, much more likely to have even higher bear mortalities than the Selkirk relocations, with much more likelihood of human/bear conflicts and injuries and deaths to both. Grizzlies don't like being around people, and I have wondered many a night sitting high on Miners Ridge or at Pumice Creek on Glacier Peak why there aren't at least a few more grizzlies around in some of those remote parts. Over the years, I've come to the sad conclusion that there are simply too many people, even in these remote corners of the Glacier Peak Wilderness. This reintroduction plan strikes me as something that's too little, too late, the genie's out of the bottle, and you're dooming these bears to roaming wilderness areas that in many places are still teeming with people. The timing of the season for PCT thru-hikers and the likely places grizzlies are going to want to hang out could hardly be worse. In one word: huckleberries. The PCT wanders through some truly amazing patches of huckleberries along the Dolly Vista section, White Pass, Pumice Creek, Harts Pass and so much of that northern larchland in the western Pasayten Wilderness ... Image Lake, near the PCT, that gets a lot of visitation, too, including clueless weekenders. On and on, the point is, right when the bears need to gorge on huckleberries, a huge bubble of thru-hikers will have worked their way north through Washington and will be hitting all these areas, sleeping with their food, hikers not even bothering to bury their feces or TP, trees often too small to hang food even without cans. And this restoration plan has no contingency plan for that other than "public education." And if Option C is chosen, well the agencies at least have a little more flexibility to shoot a few more bears ... but how many innocent, if clueless, hikers have to get mauled in the process, and how many bears have to die?

I really hope I'm wrong and just overreacting, but that's why I'm in favor of the No Action alternative. Maybe the grizzlies have given up on this area for a reason, sad to say.

Correspondence: To whom it concerns,

Grizzly bears have every right to inhabit their historic native lands. And since, grizzlies are on the threatened species list, it makes even more sense to restore them to their natural habitat. Additionally, they play a vital role in the health of the environment and other wildlife species within the ecosystem. Grizzlies also are a prominent part of the regional Native American and First Nations cultures and they contribute to the richness of the Pacific Northwest. Natives lived with grizzlies for thousands of years, so modern man can learn to do so as well. Grizzlies should be re-introduced into the North Cascades area.

Sincerely,
[REDACTED]

Correspondence: I support Alternative C: Restoration with Endangered Species Act Section 10(j) Designation, the Preferred Alternative.

I love Wilderness (designated Wilderness according to the Wilderness Act of 1964) as well as USFS and BLM non-Wilderness backcountry. But I want these lands to be wild and that includes having wildlife. So I am in favor of Alternative C. As Edward O. Wilson wrote: "When people state the common belief that being in nature relaxes them, that it helps them recover from stress and tragedy, that it's a healing process to be in nature, we now know there's a solid basis for that. The research has been done and it is true that it's good for the human mind to be able to live and experience in really natural situations. Instinctively, without understanding what's happening, they know that in certain wild environments, they have come home." That would include the grizzly bear.

Correspondence: The bears need to be reintroduced into their historic range. They are an apex species that would make this area of the Cascade biosphere more whole.

I see Alternative B to be a clearer and more easily managed process. However either B or C would get them back out into the landscape.

The real conflict would be between humans and the bear - and the survival of the bear should be the major concern - meaning that some areas may have to be closed to visitors, hikers, etc.

Good luck and thanks for allowing comment on this important matter.

Received: Nov,13 2023 16:43:20

Correspondence Type: Web Form

Correspondence: The Washington Department of Fish and Wildlife (WDFW) appreciates the opportunity to comment on the Draft Environmental Impact Statement (DEIS) for Grizzly Bear Restoration in the North Cascades Ecosystem and the proposed rule to designate a non-essential experimental population (NEP) under section 10(j) of the Endangered Species Act. WDFW is committed to grizzly bear recovery in Washington. We are an active partner on the Interagency Grizzly Bear Committee and partnered with the US Fish and Wildlife Service (USFWS) in the management and recovery of the extant population of grizzly bears in the Selkirk mountains of Washington state. Should grizzly bears occupy the North Cascades ecosystem in the future, we look forward to continued partnership with both the National Park Service (NPS) and USFWS (together hereafter, "Services"). WDFW is a cooperating entity in the DEIS process and we have consulted with USFWS in development of the proposed NEP rule. Our role has been to provide technical expertise and on-the-ground knowledge to inform the Services' decision making. State law limits WDFW's participation in any action that would translocate bears from outside of Washington into the state and also requires our participation in all discussions about grizzly bear management (RCW 77.12.035).

Below, our comments focus on: 1) the interaction of our state authorities with the potential implementation of the preferred action alternative; 2) our support of proposed flexible management tools under the 10(j) designation; and 3) highlighting the need for greater investment by the Services in outreach and conflict preparedness and response capacity.

The legal authorities surrounding a potential action to reintroduce grizzly bears in Washington State are complex. We recognize that federal statutory authorities include the US Fish and Wildlife Service responsibility to recover species under the Endangered Species Act (16 U.S.C § 1535) and the National Park Service authority to manage natural resources, including wildlife, within their boundaries through the Organic Act (54 U.S.C. § 100101 et seq.). WDFW has management authority for wildlife in the state of Washington (RCW 77.04.012), and as such regulates the importation, possession, and transportation of wildlife (RCW 77.12.047, WAC 220-450-030, WAC 220-450-010). Washington State law also states that grizzly bears shall not be transplanted or introduced into the state (RCW 77.12.035). Should the Services select an action alternative, the complicated and overlapping nature of these regulations and authorities would most easily be resolved if grizzly bears were released onto National Park Service lands, where federal authority is more straightforward. Should bears be released onto other ownerships, such as US Forest Service lands, administrative complications would be heightened. In the scenario of non-national park releases, WDFW would need to consider our position regarding RCW 77.12.035 and our role and responsibility to permit the importation and release of wildlife in the state of Washington on non-national park lands. Therefore, if an action alternative is chosen, we strongly encourage the Services implement releases only on National Park Service lands.

Further, should the Services select an action alternative, WDFW strongly suggests the current preferred alternative that includes the designation of a non-essential experimental population under section 10(j) of the Endangered Species Act. The 10(j) designation will provide USFWS, Tribes, and WDFW critical tools and flexibility to manage grizzly bear populations. Grizzly bears can cause significant damage and pose a threat to human safety, particularly if they become accustomed to

associating humans with food rewards. We applaud the clarity in the proposed rule that human safety is paramount and that all grizzly bears in the experimental population "...may be taken in self-defense or defense of others, based on a good-faith belief that the actions are necessary to protect any individual from bodily harm." Further, we appreciate and support the described expanded management tools under the 10(j) that are aimed at minimizing and mitigating human-bear conflict as well as their application into varying management zones on the landscape. The management tools described include: allowances for producers to implement deterrence measures; allowances for WDFW, USFWS, or Tribes to relocate bears in order to deconflict with human activities or prevent a bear from becoming habituated to humans; allowances for WDFW, USFWS, or Tribes to lethally remove a conflict bear under certain conditions and when non-lethal measures have been implemented and were not proven successful.

These measures are a needed complement of options for wildlife managers to have at their disposal to address the sometimes dynamic and rapidly evolving situations that unfold when large carnivores and humans share a landscape. Nuisance conflict situations that are inadequately responded to may escalate to human safety issues or incidents that would require agency actions up to and including lethal removal if inadequate management flexibility is not provided and response tools are not available early in a conflict situation. We strongly encourage USFWS to expeditiously finalize the rule to designate a non-essential experimental population as proposed.

Adequate funding resources both for outreach and for conflict response must be a paramount consideration if an action alternative is chosen and is to be implemented. The Department's own experience with large carnivore conflict has shown that tools and personnel resources need to be ready to respond at a moment's notice, and not be marshalled over a period of days, or weeks. This would likely be the case if there are not adequate federal resources ready to respond given that the Department is already heavily taxed with other human-wildlife conflict issues in the same geographic area. Without considerable new investment by the Services, the result would likely be increased risk of incident escalation, adding to safety and property risks to the public and potentially negatively impacting grizzly bear recovery.

Regardless of whether the Services move forward with a reintroduction action in the North Cascades ecosystem, WDFW looks forward to our continued partnership on our shared efforts to recover grizzly bears in Washington. To discuss these comments in more detail please feel free to reach out directly to [REDACTED], Wildlife Diversity Division Manager, at [REDACTED]

Sincerely,
[REDACTED], Director

Correspondence: Strongly urge Alternative 'A' (no Action).

NPS and FWS are already aware that the Grizzly is the top-of-the-food-chain apex predator that requires an enormous home range, as well as a diverse habitat in which to survive. History has proven that when that habitat changes due to diminished food sources, increased human presence, and wildfires the Grizzly has no choice but to expand its home range. In fact, in the states of Montana, Wyoming, and Idaho the species has been documented at expanding their home range up to three times their original roaming space. This of course will result in tragic losses of life - both of Grizzlies and their human victims.

Presumably the premise for the recovery initiative driven by NPS and FWS is to increase the overall Grizzly bear population. In fact, we believe the opposite will be the case. We believe a net loss of the animal population will result as a direct consequence of the increased incidence of Grizzly-human conflicts. Please consider the following -

- The combined human populations represented by communities located in towns and cities affected by NCE Alternatives 'B' or 'C' is significantly greater than those of existing Grizzly recovery zones. This alone will statistically lead to increased bear-

to-human interactions.

- The draft EIS has documented in other recovery zones that the majority of incidents involving Grizzly-to-human conflicts occur on private lands, not inside the recovery zone boundaries.

- While fewer Grizzlies are planned for insertion during the initial 5-year period, our higher density human population centers, animal propagation through breeding, and the expected increase in range taken by the predator will result in a disproportionate taking of human life as well as Grizzly losses.

From a purely practical standpoint, the merit of relocating Grizzlies that are factually demonstrated to have expanded in both range of habitat (two to three times expansion) and in breeding numbers is difficult to justify. Your Record of Decision should be based on merit, not politics.

Correspondence: Dear NPS,

I am writing to comment on the the NPS plan to re-locate grizzly bears to the North Cascades.

I am against this plan, but in order to create an educated response, I am asking for an extension to the comment period of at least 6 months to year. The time provided up to this point is not adequate for a working citizen to review the EIS.

I have not had a chance to review the EIS yes, but other reasons I am not in favor of this plan are: the impact to visitors of the North Cascades National Park, the unnecessary expense of the monitoring of the bears and of citizens encounters with the bears, the pressure on the animals in the park that are already being reduced by the presence of wolves, and the economic impact to the communities that rely on visitorship to the North Cascades National Park.

Thank you for considering this,

Sincerely,

Correspondence: Dear National Park Service Representative,

I ask that you not proceed with the Grizzly Bear Restoration Plan or attempt to promote an increase in the grizzly bear population in the North Cascades. My reasoning is based on the reported attacks and killings of experienced hikers and hunters in the northwest over the past several years, and person experience. In Glacier National Park in 1997, while walking on a bike path to Apgar Ranger station and hiking from Granite Park Chalet to Goat Haunt via 50 Mountain Campground, my spouse and I encountered 9 bears, 5 of which were grizzly bears. When walking to Apgar Ranger station, we had no packs and were on our way along a busy bike path through the forest near the entrance to the park to get our permits and bear spray. We did not see and startled a sow and her cub about 10 feet from us on the side of the path. We had been talking, being very careful of our surroundings. The cub scrambled up a tree, and the sow tracked us for 100 yards walking in parallel to us about 10 feet away as we walked back toward the way we came. Later, at a pass above 50 Mountain Campground, in a rain/snow storm, we found in the middle of the path a hole the size of a basketball, an overturned rock, and a pile of steaming scat. Then later while approaching Kootenai Lake, hiking on the main trail through dense vegetation, while singing and talking the whole time, we startled a juvenile grizzly bear about 10 feet from us.

These encounters were too close for comfort. I don't want similar experiences in the North Cascades. If the bears are reintroduced, I will not feel safe with bear spray alone, and will opt to carry a firearm. The reports from grizzly bear supporters of the plan who dismiss these encounters and say that they are rare are not accurate at least for me; they are not consistent with my experience, and we followed all the rules to minimize contact and encounters with the bears.

Thank you,

Correspondence: I'm a 27 year resident of WA State and I support the proposed reintroduction of brown bear / grizzlies back into the North Cascades. I am fully away of what this means. I've done extended backpack trips into dense grizzly country (the Gallatin Range out of Yellowstone NP). Hiking, backpacking, living with grizzlies can be achieved in a relatively safe manner. There are no guarantees and I learned when hiking through the Gallatin range but with proper behavior and awareness...risks can be minimized and species can co-exist. Grizzlies are native to the range and the system can be healthier overall when the ecosystem is restored. Grizzlies are essential to that mixture. We learned how the reintroduction of wolves to Yellowstone made the ecosystem healthier. The same can be done with grizzlies and the North Cascades. Our policies shouldn't by default always favor humans. Grizzlies in the North Cascades gives them a chance. It does mean that humans have to be more aware of their surroundings and modify their behavior. Just because some humans don't want to do this or are afraid of large carnivores in the wild doesn't mean the reintroduction shouldn't take place. We shouldn't always default to favoring humans. Giving grizzlies a chance doesn't have to put humans at risk...humans can...and will adapt.

Please...I'm urging you...please proceed with this reintroduction. We need to reverse decades and centuries of destruction of native species. This is a step in the right direction.

Correspondence: Plan A is the only Reasonable approach. Don't introduce new Grizzlies into the N Cascades. It will only lead to attacks on humans. Recent news events show that humans and grizzlies don't mix. An experienced couple in Banff NP

and their dog- DEAD; a female bicyclist in a MT campground- DEAD; Idaho hunters killed 2 grizzlies in self-defence, as did a hunter in MT: 3 Grizzlies DEAD/Euthanized; A MT woman DEAD, killed in her own home by a Grizzly. You know that the number of hiker's, backpackers, hunters, trail runners increase each year at a fast pace, and it's hard to find a backcountry campsite during the summer in the N. Cascades. Thousands of PCT Thru and Section hikers, joined by the booming population of the Puget Sound area. You know that many of these newer hikers don't follow good practice: campsite and popular trail areas are littered with feces and toilet paper; people cook in their tents to avoid mosquitos or rain; food is not secured at night. Adding Grizzlies to the N. Cascades will increase the number of attacks on humans (many of them stupid humans) and then the bear has to be euthanized for doing what comes naturally. If they stray into killing livestock, they will be killed. It's not fair to the bear and dangerous for humans. If Grizzlies are introduced into the N. Cascades, I, several friends I've spoken with, and probably many, many others will be taking our firearms with us in the backcountry, which raises a whole another level of dangerous.

NO NEW Grizzlies. If they come on their own, a few at a time, we will have to live with that, but please, don't Set Up human-grizzly conflict by moving any bears into the N Cascades.

Thank You,

RE: NORTH CASCADES ECOSYSTEM DRAFT GRIZZLY BEAR RESTORATION PLAN/ENVIRONMENTAL IMPACT STATEMENT

These comments are submitted on behalf of the undersigned groups, individuals, and our supportive members that work in collaboration to promote the safety and welfare of all grizzlies south of Canada with the goal of establishing a large-scale grizzly bear ecosystem recovery zone with appropriate linkages, ensuring the long-term viability of bears in face of the imminent effects of climate change.

We appreciate the opportunity to offer comments on the Draft Grizzly Bear Restoration Plan/Environmental Impact Statement for the North Cascades Ecosystem.

We support Alternative A: No Action.

Grizzly bears should be allowed to immigrate naturally back into the North Cascades Ecosystem from British Columbia and the recovering protected grizzly bear population in the conterminous 48 states. Grizzly bears should not be removed from an ecosystem where they are protected as a threatened species under the Endangered Species Act (ESA) and placed into an ecosystem where those protections will be diminished under the ESA 10(j) rule. All grizzly bear populations and individual grizzly bears are essential to recovery of the species.

We support a recovered and interconnected population of grizzly bears fully protected under the Endangered Species Act inhabiting all suitable habitat within and between designated Grizzly Bear Recovery Zones. Both long term survival in each

of the designated Grizzly Bear Recovery Zones and the overall recovery of grizzly bears in the conterminous 48 states is dependent on interconnecting core habitat currently designated in recovery zones and protecting explorer bears traveling in these connectivity corridors. Explorer bears, an essential component of interconnected populations, would be the very bears at risk with the 10(j) rule in effect. Current isolated populations, and a newly established and isolated NCE population of grizzly bears must be linked.

Translocating a grizzly bear puts the bear at risk of injury or death resulting from capture, chemical immobilization, transport, and release. It is far better to let grizzlies populate the North Cascades Ecosystem on their own. No grizzly bear should be subjected to these risks to be part of a non-essential population.

Allowing the NCE grizzly bear population to be managed under the 10(j) rule sets an unwarranted precedent for future reintroductions. When the grizzly bear was listed as threatened under the Endangered Species Act in 1975, populations were not listed as discrete entities, the grizzly bear was listed as, "the Grizzly Bear of the 48 Coterminous States." The grizzly bear population in the conterminous 48 states should remain one population and be managed as such with focuses on protecting core habitat, connecting core habitat with migration corridors, and protecting explorer bears outside of recover zones.

In 1993 U.S. Fish and Wildlife Service Grizzly Bear Recovery Plan (Plan) identified six ecosystems, with recovery zones at the core of each, to further recovery efforts. Each recovery zone was supposed to represent an area large enough and of sufficient habitat quality to support a recovered grizzly bear population. Current science shows none of the recovery areas is of sufficient size to independently support a recovered population. (Allendorf et al. 2019). Current recovery strategy recognizes that grizzly bears would need to move and reside permanently in areas outside the recovery zones and that connectivity between recovery areas would be necessary for isolated populations to increase and sustain themselves at recovery levels.

Reintroduction under the 10(j) rule will inhibit the goal of population connectivity and remove protections outside of recovery zones laid out in the Plan. An integral part of the goal of restoring grizzly bear populations is to implement measures within the authority of the NPS and USFWS is to minimize human-caused grizzly bear mortalities. Reintroducing grizzly bears under the 10(j) rule decreases protections and will increase the likelihood of human caused mortality.

The Plan's goal is a recovered and interconnected population of grizzly bears, therefore the NCE population cannot be managed as a discrete population under 10(j). First, this assumes explorer bears will not be immigrating and emigrating into and out of the NCE Recovery Zone and secondly, this movement is and should be the goal of the program; to achieve recovery of grizzly bears as one interconnected, interbreeding and sustainable population, with the ultimate goal of removal from the Federal List of Endangered and Threatened Wildlife.

Reintroducing artificially relocated bears to yet another additional isolated population of grizzly bears in the North Cascades will likely not meet the goal of species recovery and removal of Federal ESA protections.

Correspondence: To whom it may concern,
I live in the N. Cascades ecosystem full-time, and spend as much time hiking in the the mountains and in the neighboring wilderness areas as possible, including N. Cascades National Park and the Pasayten Wilderness. I share my neighborhood on the valley floor with black bears and have assisted in efforts to educated our community about how to co-exist with bears. While there is much more work to do in this regard, folks in the Methow Valley are paying attention to their own behavior as potential bear attractants. I love that I get to hike in a place where being alert and aware may allow me to see wildlife and to stay safe. In my many miles of hiking I've had far more miles of no sign of black bears than those miles occasionally littered with bear sign, informing me of their proximity. I support intact ecosystems without hesitation. I know that if grizzlies are reintroduced I will carry my bear spray faithfully with the same level of alertness I do now. I support the reintroduction plan as presented which seems reasonable and conservative, with ample time to adjust as events unfold.

Recommend Alternate 'A' (No Action)

The National Park Service and US Fish and Wildlife Service are proposing actions involving Grizzly bears that if enacted will have been implemented only through the agencies' willful contravention of Federal law, NPS Management Policy, and Washington state law. Both agencies are official Lead Agencies in the administration of the North Cascades Ecosystem Grizzly Bear Restoration Plan / Environmental Impact Statement (September 2023).

The National Environmental Policy Act (NEPA) requires Federal agencies to assess the environmental effects of proposed major Federal actions prior to making decisions. Federal law further mandates lead agencies that are privileged to publish Environmental Impact Statements to comply with the requirements of Code of Federal Regulations PART 1502 (Environmental Impact Statement). This process is required so that full and fair discussion of significant environmental impacts occurs. Clearly the public have been denied this opportunity. By its conduct and practice of omission of relevant information, and having concealed information from the public, intentional information hiding that has direct consequences to public safety, the National Park Service and US Fish and Wildlife Service are in violation of both NEPA and CFR Part 1502.

Grave consequences resulting from any agency Record of Decision that would place Grizzly bears onto public lands will include unnecessary human deaths and injuries to the public. Despite the available statistics of historical injuries and deaths

available to NPS and FWS both of these agencies have been silent on these threats in the subject EIS as well as in public meetings that are now concluded. Withholding relevant information from the public, especially where that information is material to, and represents threats to public safety, is a serious breach of the public trust, one which will result in tragic outcomes to those who have been led astray by these agencies.

Examples of "information hiding" include the withholding of reports from the public that empty bear spray canisters have been found next to the dead bodies of those killed by grizzlies; or despite viable populations of Grizzlies in Montana, Wyoming, and Idaho, the U.S. Fish and Wildlife Service has ignored petitions by these three states to delist the Grizzly; or that the previous Director of U.S. Fish and Wildlife Services stated before Congress that the grizzly is biologically recovered. The Director stated this based on the thousands of Grizzlies in Montana, Wyoming, Idaho, and Canada. In other words, for many years the Grizzly bear species has enjoyed a full recovery in these recovery zones and through their prolific breeding and enormous range expansion the management programs of NPS and FWS have been shown to be completely inadequate as evidenced by the increasing deaths and injuries, the majority of which are occurring outside recovery zone boundaries on private lands.

Citations of NEPA, CFR Part 1502, NPS Management Policy, and Washington state law:

- Pursuant to CFR Title 40 Chapter V Subchapter A, Part 1502.2(b) states, "Environmental impact statements shall discuss impacts in proportion to their significance."
- Pursuant to CFR Title 40 Chapter V Subchapter A, Part 1502.2(f) states, "Agencies shall not commit resources prejudicing selection of alternatives before making a final decision."
- In accordance with NPS policy at Section 4.4.2.2 of the 2006 Management Policies Manual states: "The Service [NPS] will strive to restore extirpated native plant and animal species to parks whenever all of the following criteria are met: 2) The species does not, based on an effective management plan, pose a serious threat to the safety of people in parks, park resources, or persons or property within or outside park boundaries."
- Section 1.9.1.4 of the 2006 NPS Management Policies manual emphasizes that human life must not be compromised, rendering analysis in the final NCE/EIS a necessity, and states: "The safety and health of employees, contactors, volunteers, and the public are core Service values. In making decisions on matters concerning employee safety and health, NPS managers must exercise good judgment and discretion and, above all, keep in mind that the safeguarding of human life must not be compromised. "
- The Revised Code of Washington (RCW 77.12.035) unambiguously prohibits transplantation or introduction of grizzly bears into the State, including Federal initiatives. RCW 77.12.035 states in part - "Grizzly bears shall not be transplanted or introduced into the State. Only grizzly bears that are native to Washington State may be utilized by the department for management programs."

Office of the Superintendent
North Cascades National Park Complex
Grizzly Restoration EIS

810 State Route 20
Sedro-Woolley, WA 98284

Sent via: <https://parkplanning.nps.gov/commentForm.cfm?documentID=132104>

Dear North Cascades National Park Complex Grizzly Recovery Planning Team:

Wilderness Watch is providing these comments on the Draft Grizzly Bear Restoration Plan-Environmental Impact Statement North Cascades Ecosystem (DEIS). Wilderness Watch is a national nonprofit wilderness conservation organization dedicated to the protection and proper stewardship of the National Wilderness Preservation System. Wilderness Watch strongly supports grizzly bear recovery in the North Cascades provided it can be accomplished in a manner that is both respectful of and protects the area's wilderness character and does not result in the unnecessary deaths or harassment of grizzly bears. As such, we feel there are major changes needed to the proposal and DEIS in order for it to accomplish these goals. We also oppose the issuance of a 10(j) rule because it will likely result in the additional loss of grizzly bears and greater deterioration of the Wildernesses in the Cascades, Northern Continental Divide, and Greater Yellowstone Ecosystems.

Attached to this comment is the comment on the 10(j) Rule. While the National Park Service (NPS) may choose to ignore the comments on the 10(j) rule, these two issues are integrally linked.

On occasion, we quote from our past comments and submissions to summarize key points rather than repeat them verbatim in their entirety because you already have those comments and they are part of the record. Also, most of the points made in those past comments are still relevant as the errors in this DEIS remain. Thus, we incorporate by this reference our past comments and submissions for the various iterations of grizzly recovery proposals in the NCE that have been undertaken.

Introduction

A few key points, summarized or alluded to from past comments that are applicable to the current DEIS, are listed below. It is not an all-inclusive list:

- The use of helicopters, trucks, or other mechanized equipment is incompatible with Wilderness. The DEIS proposes a decades-long assault of motorization, grizzly augmentation, and invasive monitoring in Wilderness that are clearly not the minimum necessary. We go into more detail later in this comment.
- The failure to even analyze a pro-active natural recovery alternative biases the DEIS. Further, the real reason for rejection of this alternative is political, rather than scientific, as proven by comments recently made by the North Cascades National Park Complex Supervisor. We go into more detail later in this comment on this issue.
- Connectivity is a major issue. Population ecologists recognize that long-term survival of grizzlies in the lower 48 states can't occur without connectivity to other populations. As such, the fate of any US North Cascades population would be based upon habitat protections, connectivity, and grizzly protection in British Columbia.
- Given the grizzly bear's low reproductive rate, any recovery, regardless of the method employed (augmentation or natural recovery), will take several decades. Augmentation risks the loss of bears from elsewhere, who are placed in unfamiliar surroundings further delaying connectivity and recovery of other populations. Natural recovery does not pose that risk.
- For social and ecological reasons, natural recovery is preferable. Grizzlies that find their own way into the Cascades are likely to find more human acceptance and will be better equipped to deal with humans, than if those bears are released by federal agencies. While the NCE has good habitat, it is also heavily used and adjacent to millions of people.
- Bears from the Northern Continental Divide Ecosystem (NCDE) and Greater Yellowstone Ecosystem (GYE) are not recovered. Removal of grizzlies in those places would prevent recovery of a connected population in the US Northern Rockies including bears which are currently recolonizing the Bitterroot Ecosystem (BE).

The tenor of the DEIS strikes a discordant note as it frequently refers to the national park units and the national forests as

NPS and USFS lands. For example, see DEIS at 12. These are not lands owned by either agency, but the American public as a whole. This erroneous sense of proprietary rights reveals an ugly truth about how the agency views its appropriate role and public service.

Wilderness

Natural recovery is a better option for the long-term well-being of the bears as well as for Wilderness. The use of helicopters, trucks, or other mechanized equipment is incompatible with Wilderness. Options for restoring populations of grizzlies should include measures that are compatible with and respectful of the region's wilderness character including non-motorized and non-mechanized translocation and monitoring of the animals, if that option is selected. Further, even radio collars trammel the wildlife and therefore the Wilderness itself. Wilderness is as much a process as place. It is "untrammeled by man" (wild or unmanipulated or unconfined) with "primeval character and influence." These relate directly to a process that is devoid of human intent to manage habitat or wildlife. In this case, if grizzlies are present in the Wilderness or if it is likely they will expand into the Wilderness, then it should not be necessary to augment them.

Our past comments address the essence and requirements of the Wilderness Act. They are part of the record. When it comes to the statutory requirements of the Wilderness Act, the DEIS is inadequate. We focus on three of these inadequacies in the section that follows:

- The DEIS does not mention the Wilderness Act in the section on statutory direction for grizzly recovery beginning on page 18.
- The DEIS fails to show that translocating bears is the minimum necessary for preservation of the Wilderness, as required by the 1964 Wilderness Act. Similarly, it fails to show that translocating grizzly bears via helicopter into Wilderness and the associated heavy-handed management of collaring, monitoring, and return helicopter intrusions, is the minimum necessary.
- The DEIS downplays the impacts of the heavy-handed action alternatives on Wilderness. Our past comments detailed the problem of the MRA/MRDG process. The dissection of the wilderness attributes via the fatally flawed MRA/MRDG process, which is employed as the protocol for analyzing impacts to Wilderness in this DEIS, downplays the impacts to Wilderness and fails to recognize the essence of Wilderness.

The omission of the Wilderness Act as statutory direction sadly reflects the disregard the NPS shows toward Wilderness. The routine use of helicopters as packstock for trail work and other activities is emblematic of this problem (see DEIS page 96). It seems the agencies view Wilderness as a hurdle to overcome rather than the wild place it is; the domain of creatures like the grizzly.

The DEIS fails to show that translocating bears or the extensive use of helicopters and collaring is the minimum necessary for preservation of the Wilderness. Regarding the translocation of bears and the minimum necessary we wrote in our past DEIS comments (footnote omitted):

The DEIS does not make the case that translocation of bears in Wilderness is necessary. Natural recovery was not analyzed in the DEIS, and thus underlying factors limiting natural recovery were not adequately disclosed and analyzed. If habitat limitations, human-related conflicts, connectivity limitations, or other factors are limiting natural dispersal and recovery, the agencies must explain why those underlying factors cannot be addressed to encourage natural recovery, or alternatively, why those underlying factors will not similarly limit translocation success. In other words, natural recovery would need to be fully considered before translocation could be determined necessary and viable. Additionally, the DEIS inadequately addresses the issue of translocation outside of Wilderness. We address these issues in more detail under the Alternatives section.

Assuming translocation is necessary, the DEIS does not make the case that helicopter use, especially at the levels proposed in the action alternatives, is the minimum necessary. Also, the ongoing collaring and recapture of bears (which is only mentioned and not analyzed in the DEIS) is not shown to be the minimum necessary. Noninvasive monitoring techniques, for example, are not considered and risk factors associated with capturing, collaring, and active transmittal of telemetry data are not disclosed and analyzed.

Looking first at natural recovery, or at least migration from Canada to the US, a news report quoting the superintendent is revelatory. An article from the Skagit Valley Herald on February 12, 2023, entitled National park superintendent talks about challenges facing North Cascades, states:

Since his arrival at the park in late 2021, Striker's thought has been that if Canada does relocate grizzly bears and if they end up establishing a population in North Cascades National Park, then managing them as an experimental population is no longer an option.

"... We are going to be stuck with the normal fish and wildlife rules that say you pretty much can't do anything," he said.

Striker believes the best approach is to get an experimental population in place before the bears arrive on their own.

So much for the claim in the DEIS that grizzly bears won't make it down to the US North Cascades, the basis for rejecting analysis of a natural recovery alternative. The superintendent apparently believes natural recovery will happen and he wants to prevent grizzlies that do come from Canada from full protection under the ESA! Hence, the rush to bombard the Wilderness with helicopters to bring grizzlies taken from other places under an experimental, nonessential population designation. We expect better from our public servants. In sum, the DEIS dissembles the public regarding the possibility of natural recovery even though natural recovery as it relates to the US North Cascades is apparently viable. Therefore, it would be the minimum necessary to protect Wilderness.

If translocating bears were the minimum necessary, and we greatly doubt it because of indications to the contrary as explained in the preceding paragraph, then the next step would be to do it in a way that is the minimum necessary to protect Wilderness. The DEIS states grizzlies will be trapped (supposedly most of the capture would occur outside of Wilderness, though page 108 of the DEIS suggests it could occur inside) and transported in trucks to a staging area. The protocol is to relocate grizzlies away from roads and trails. However, grizzlies are mobile and contact with humans is inevitable, especially in areas that see so much recreation use like the North Cascades. Rather than having all action alternatives confine grizzly placement in the NCE to helicopters (all) in Wilderness (with few or no exceptions), putting grizzlies in remote or relatively remote areas not in Wilderness is an option that should have been explored. Temporarily closing primitive roads for placing grizzlies is preferable. Using helicopters in non-Wilderness backcountry areas is not preferred because of the risks helicopter pose as evidenced by a recent accident at Copper Lake.

Ironically, the agencies' reluctance to temporarily close areas to human use as expressed in the DEIS is belied by the fact the roadless Copper Lake area was recently closed to public use to recover a crashed helicopter (see the footnote above). This behavior sends a signal to the public that the agencies place little value on protecting Wilderness. These options discussed above are less intrusive to Wilderness and would be the minimum necessary if indeed translocating bears is required, yet are not considered by the agency.

Figure 11 (page 107) of the DEIS shows that a portion of the Western Pasayten potential release zone is in roadless country outside of Wilderness and near staging area G. Places like the South Fork Slate Creek and Boulder Creek are remote, trailless areas inside the release zone. The headwaters of the West Fork Methow River and its southern tributaries and the South Fork Trout Creek are trailless areas bordering the release zone. Even better is using the road over Hart's Pass rather than accessing this region via helicopter. The flat near the mouth of Sliver Creek west of Ross lake is in non-wilderness and trailless area bordering the North Unit Park zone and close to staging area A (DEIS Figure 11), but it would require helicopter or boat access.

Other areas where bears might be placed would include Sibley Creek northwest of Cascade Pass Trailhead via the Sibley Creek 1540 route or helicopter in the upper reaches. The non-wilderness portion of Alma Creek, Rhodes Creek (Thunder Creek area) out of the Wilderness, the far reaches of the Baker Lake Road, and areas near Lucerne and Holden could be considered. This list is not exhaustive.

Further, page 92 of the DEIS states, "there is a corridor 100 feet wide, and 50 feet either side of the center of the Cascade and Stehekin River Roads, which is not part of the wilderness designation." These trailheads could be release sites. The Cascade Pass Trailhead is accessible by wheeled vehicle and could be temporarily closed; the Cottonwood Camp is temporarily unavailable to wheeled traffic and could be a release site--it is within the South Unit, Park and GPW (DEIS page

107)- though it would have an impact on the surrounding Wilderness as it would have to be accessed by helicopter. While it is not a preferred site, it is outside of Wilderness.

Even if none of the above suggestions for translocation areas outside of Wilderness prove adequate, the point is the agency has not done a thorough analysis of options outside of Wilderness. Only part of one translocation area is located out of Wilderness.

The Wilderness Act contains a "narrow" exception authorizing helicopter use only where necessary to "further the wilderness character of the area." Wolf Recovery Found., 692 F. Supp. 2d 1264, 1267-68 (D. Id. 2010) (quotation omitted). This exception permits otherwise-prohibited activities only in the "most rare of circumstances" in which denying the activity would itself compromise the integrity of the Wilderness. Id. at 1268. Invoking this provision on such a broad scale (144 landings) would contravene the statutory language and its interpretation by the federal courts, and would permit the exception to swallow the rule that helicopter use is prohibited in Wilderness. See id. ("Helicopters carry 'man and his works' and so are antithetical to a wilderness experience. It would be a rare case where machinery as intrusive as a helicopter could pass the test of being 'necessary to meet minimum requirements for the administration of the area.'").

The only logical conclusion is the DEIS fails to show that either translocating bears or a motorized assault on the Wilderness is necessary to protect the Wilderness and recover grizzly bears. The indication by the superintendent that translocations just north of the border in Canada would lead to a natural recovery south of the border, something the agency wants to prevent, and the failure to consider areas outside of Wilderness for translocation are two fatal flaws in the DEIS.

The DEIS downplays the impacts of the heavy-handed action alternatives on Wilderness. Some background dissecting the Wilderness Act into competing parts is in order because this erroneous fragmentation of wilderness attributes is the basis for making the Wilderness Act a procedural rather than a substantive law, via the flawed MRA/MRDG process.

The DEIS at 91 cites to Landres et al. 2015. This flawed protocol is the subject of the Cole et al. 2015 critique which has already been provided to you. Aside from the fact it is not legal or logical there are three other problems with this approach illustrated in the bullet points below that relate directly to the Landres et al. Reference.

1. The Origins and Consequences of Defining Wilderness Character through Fragmenting The Eloquent Whole of the Wilderness Act

Landres and others identified their various attributes of wilderness character by dissecting the Wilderness Act. It was an exercise in reductionism. From our communications with Landres, the main purpose behind this exercise was to be able to objectively monitor changes in wilderness character in the National Wilderness Preservation System. Hence, the protocol cited in the DEIS, Keeping it Wild 2. While this process to define wilderness character was undoubtedly a well-intended effort, as time has passed, it is clear it has serious negative unintended consequences for Wilderness. Other wilderness specialists and researchers recognize these failings in their pointed critique (again, see Cole et al. 2015). A prime example of a negative consequence is the erroneous idea that managers could trade off various components of wilderness character against each other, thereby reducing the Wilderness Act into a procedural process via the MRA/MRDG process. This management mindset, which effectively repeals and rewrites the Wilderness Act, is a recent development. It is doubtful even those wilderness specialists who defined wilderness character in a reductionist manner would concur. That leads to the second point below.

2. This bizarre dissection of the Wilderness Act conflates the essence of Wilderness, its character, with other attributes.

Footnote 2 provides an introduction to this topic. Cole et al. 2015 continue on page 4:

The five-quality KIW2 definition confuses wilderness character with a list of all the things we value in wilderness and would like to protect and preserve. By making all wilderness values a part of wilderness character, and treating all those values as equal in importance, this definition negates the intended purpose and meaning of wilderness character. Most onerously, it undervalues the importance of protecting wildness. Wilderness character cannot be protected above other wilderness attributes and values if all attributes and values are included in the definition of wilderness character and wildness cannot be

emphasized when it is just one of many values that managers might protect.

In recent years, our concerns about the inappropriate KIW2 definition of wilderness character have grown, as those who developed it have promoted its use--not just as a monitoring framework--but as the basis for wilderness stewardship (Landres et al. 2011). Without meaningful public involvement, the agencies charged with wilderness management have incorporated the five-quality definition into their stewardship policy and guidance and it has been incorporated into stewardship decision making processes such as the Minimum Requirements Decision Guide (Arthur Carhart National Wilderness Training Center n.d.). Wilderness stewardship decisions based on an inappropriate definition of wilderness character are likely to be inappropriate and ultimately will harm wilderness. Of particular concern is the internally contradictory nature of the KIW2 framework, which makes it acceptable to trade-off degradation of a quality such as "untrammeled" for improvement in another quality such as "natural." This gives managers almost infinite discretion in deciding which values will be protected and which will be compromised to achieve their goals.

In this article, we provide a more appropriate definition of wilderness character and a rationale for why wilderness character should be defined this way, arguing that our definition is more consistent with the Wilderness Act and better for wilderness than the five-quality KIW2 definition. We address concerns that some have raised with our approach and conclude with specific recommendations for moving forward in a manner that meets many of the goals of KIW2, despite the need to develop a more appropriate definition of wilderness character.

In a program review initiated by the four federal agencies, including the NPS, and conducted by the Pinchot Institute for Conservation in 2001, the importance of untrammeled (or wildness) is emphasized. The purpose of the study was to examine the critical administrative or stewardship issues facing Wilderness. One of the eight "fundamental principles" for stewardship emphasized the need to preserve the wildness in Wilderness. As the Pinchot report stated, "Protection of the natural wild, where nature is not controlled, is critical in ensuring that a place is wilderness... Since wild is a fundamental characteristic of wilderness that is not attainable elsewhere, if there is a choice between emphasizing naturalness and wildness, stewards should err on the side of wildness." This clear direction, developed at the behest of the agencies, precedes the flawed MRDG/MRA process and the monitoring protocol. Neither the MRDG/MRA process or the monitoring protocol have gone through rulemaking.

3. The Monitoring Protocol Itself Does Not Offer Support for the Manipulation Proposed for the Wilderness in the North Cascades

In *Keeping It Wild 2: An Updated Interagency Strategy to Monitor Trends in Wilderness Character Across the National Wilderness Preservation System*, Landres et al. 2015. RMRS-GTR-340 has this to say about untrammeled:

To preserve the Untrammeled Quality of wilderness, managers need to exercise restraint when authorizing actions that manipulate any aspect of the wilderness--in general actions that trammel should be avoided as an essential principle of wilderness stewardship unless it can be shown that these actions are necessary to preserve wilderness character as a whole (Kaye 2014).

Landres et al. 2015 at 34. It is hard to conceive of trammeling actions that would be necessary for this purpose. The Strategy cited above and its associated Monitoring Selected Conditions Related to Wilderness Character: A National Framework.

Landres, et al. 2005. RMRS-GTR-151 cite two of the Forest Service's preeminent wilderness researchers in describing how the untrammeled quality of Wilderness affects management. Cole (2000) in Framework states that untrammeled "suggests more about the process of management than it does about the outcomes of management." (Emphasis added). The Strategy paper states,

Lucas (1973, p. 151) stated, "If ecological processes operate essentially uncontrolled within the Wilderness frame of reference, the results, whatever they might be, are desirable by definition. The object is not to stop change, nor to recreate conditions as of some arbitrary historical date, nor to strive for favorable change in big game populations or in scenic vistas. The object is to let nature 'roll the dice' and accept the results with interest and scientific curiosity."

Landres et al. 2015 at 33. The action alternatives that affect the Stephen Mather, Pasayten, and Glacier Peak Wildernesses are not consistent with this guidance.

In other words, the fragmentation of the Wilderness Act into inconsistent and competing directives is the wrong approach. It misses the essence of Wilderness and violates the laws of statutory construct. Regardless, the monitoring protocol is not to be used as a decision-making tool as is being done in this case.

The DEIS admits on page 94 that the NPS “participates in a number of actions that may trammel wilderness in an effort to protect other qualities of wilderness character.” See also page 99 for Forest Service actions. As noted above, this approach is contrary to statutory construction and any reading of the Wilderness Act. The actions, supposedly on the part of natural , always affect the wildness/untrammelled essence of Wilderness.

We really don't know how many helicopter flights and landings will be done or the time frame for this project. The DEIS suggests 144 (page 30) and 10 years, but other pages (compare 26 and 33) implies more helicopter flights could be used in the adaptive management phase, which will last from 60 to 100 years. Further, the DEIS's analysis that 144 helicopter landings and the trammeling actions are only temporary ignores the fact that a trammeling is permanent (see pages 104 to 110). Under the twisted rationale expressed in the DEIS (including the MRDG), it would be okay to allow motorized use in Wilderness to enhance the recreational public purpose of wilderness, say for two weeks every year, since it is only temporary. Downplaying the impacts as the DEIS does is like saying that a violent assault on a person has no lasting effects once the assault ends. In essence, the proposal is an administrative decision to de-designate Wilderness, at least for decades.

The MRDG (and elsewhere in the DEIS too) makes the same mistake we raised in our past comments. The following bullet points summarize those concerns:

- The draft MRDG determination of necessity is made in step one before weighing the various wilderness attributes, which occurs in step two. While untrammelled is the preeminent wilderness attribute, it is buried by the flawed MRDG protocol and reduced to a second-class status.
- The second step of the MRDG confuses the public purposes (plural) of Wilderness) in section 4(b) of the Wilderness Act with the singular purpose mentioned in section 4(c) of the Act (see page E-9). Prohibited uses in section 4(c) are only allowed if they are the minimum necessary for the singular purpose of the Act. If prohibited uses could be waived to facilitate, for example, recreational use, which is found in section 4(b), then motorized use and buildings could be constructed to enhance recreation.
- The finding of necessity in the draft MRDG (and elsewhere in the DEIS too) is contradictory to agency actions elsewhere. If it is necessary to translocate bears in the NCE, why is it no longer necessary in the Bitterroot Ecosystem grizzly recovery area, where the decision to do was withdrawn? Removing bears from one threatened population to another could endanger both populations and would have a negative impact in both cases on Wilderness (see also DEIS on page 108, which only does a cursory analysis of impacts to removing grizzlies from Wilderness for translocation to the NCE). The tradeoffs rating in the MRDG are in error. Page E-16 fails to include the ongoing trammeling of collaring grizzlies, which could entail more trammeling or motorized use in Wilderness. Only one item is counted as trammeling in the checklist. The features of other value turns the Wilderness Act on its head. It considers that use of helicopters beneficial to Wilderness. Such a conclusion is absurd. Even then, the MRDG rating system shows this action has more negative impacts.

In sum, the Wilderness analysis in the DEIS (including the MRDG) is inconsistent with the Wilderness Act and NEPA. As shown above, it downplays the extensive damage to Wilderness from the proposal. It refuses to look at alternatives that recovery grizzlies and protect Wilderness. It ignores fully analyzing issues like vegetation removal in Wilderness for the sole purpose of landing sites (page 14) and soundscapes, which affect areas in and out of Wilderness (page 15). The DEIS needs to be drastically altered to include options that don't invade Wilderness and do an adequate analysis of impacts on Wilderness in the NCE and the US Northern Rockies.

Grizzly Bears

In our past comments we noted:

The paucity of information about grizzlies in British Columbia in the DEIS is troubling because the purpose and need is premised on a conclusion that no natural recovery could ever take place. Even if that conclusion were accurate, and no connectivity is or would be available in the future, the number of bears that would occupy the NCE are too few for long-term viability (see Attachment K). Thus, the action alternatives that are studied would effectively condemn the translocated bears or their offspring to eventual extinction under that assumption.

In sum, the purpose and need is premised on a conundrum. The assumption that connectivity of grizzly populations in the NCE and elsewhere in BC is no longer possible, so translocation to the NCE is necessary. Yet, the NCE is not large enough for long-term viability of grizzly populations without connectivity. Without more information about the situation in BC, and without an alternative fully exploring natural recovery and efforts the agency may take to increase the success of natural recovery, it is impossible to gauge the need and ultimate effectiveness of more intrusive translocation efforts.

The DEIS promotes taking bears from the NCDE, GYE, and in British Columbia. It does not evaluate the impacts of taking bears from the two sub-populations in the US Northern Rockies, both listed as threatened. Will recovery be hampered by the removal of bears from those two sub-populations and in the Bitterroot Ecosystem, where bears are just now returning? How does taking grizzlies out of their territories in Wilderness in the Northern Rockies affect those Wildernesses and others in the US Northern Rockies, such as the Selway-Bitterroot Wilderness where grizzlies are starting to recolonize?

The experimental, nonessential listing under section 10(j) of the ESA could easily fail as well. There is far more latitude to kill grizzlies under the experimental population designation than under full protection as threatened or endangered, which the population currently warrants. In fact, the NCE recovery area has inclusions within it that are Management Zone 3, "that may be incompatible with grizzly presence" under the 10(j) rule (see DEIS pages 36 and 37).

Since there are no food storage orders currently for the Okanogan-Wenatchee National Forest, and the Mt. Baker-Snoqualmie National Forest just initiated such an order this year, it seems premature to consider releasing bears until a program is in place and operating for some time that deals with sanitation, food storage, and public education (DEIS page 25). The 10(j) rule and the lack of preparation for recovery or augmentation are serious threats to grizzlies and the Wilderness.

Page 7 of the DEIS shows a map of where grizzlies are located in various units in BC, but it does not do the same for the US. Having a better visual representation is important.

Summary

As our earlier comments stated:

Wilderness Watch urges the agencies involved to take all measures necessary to promote the natural recovery of grizzlies to the North Cascades Ecosystem. We urge you to encourage the government of British Columbia to take all necessary measures to protect grizzlies in the ecosystem on the Canada side of the border. Only after measures are in place to protect existing populations of grizzlies, and those measures are shown to be inadequate to allow the natural recovery of grizzlies in the area should augmentation be considered.

Grizzlies should be an important part of the wild Cascades. However, the DEIS fails to make the case that augmentation, especially with the proposed means that harm Wilderness, is truly needed or that it will have some measure of success. The grizzly bears and the Wilderness deserve nothing less than a well-considered analysis, which this DEIS fails to accomplish.

Please keep us updated on this proposal.

Sincerely,

Conservation Director

RE: Draft Grizzly Bear Restoration Plan / Environmental Impact Statement, North Cascades Ecosystem

Dear Superintendent,

I wanted to first state that I personally support the restoration of grizzly bears in the North Cascades, and that I support National Park Service's preferred Alternative C: Restoration with Endangered Species Act Section 10(j) Designation.

Although there are many different facts, values and points-of-view that need to be considered regarding how best to restore bears there, I believe that the grizzly bear belongs in the North Cascades and that the responsible thing to do is for agencies to help restore a sustaining population of bears in the habitat.

I also want to share a position statement that The International Association for Bear Research and Management (IBA) prepared for an earlier Draft Grizzly Bear Restoration Plan/EIS Impact Statement, dated January 2017. The IBA is the global professional society of bear specialists and I want to make sure their comments and perspectives were considered in this EIS. Though the alternatives and approaches may have changed somewhat, there are quite a few points that should still be relevant and considered for this effort. IBA's earlier submission on the previous Restoration Plan/EIS follows.

Sincerely,

██████████

23 October 2019

Superintendent, North Cascade National Park Service Complex

810 State Route 20

Sedro-Wooley, WA 98284

RE: International Association for Bear Research and Management comment on Draft Grizzly Bear Restoration Plan/EIS Impact Statement, dated January 2017

Dear Superintendent:

The International Association for Bear Research and Management (<https://www.bearbiology.org>) is the professional organization of bear researchers and managers involved with the world's 8 bear species. We have more than 500 members from all continents with bears, publish the peer-reviewed journal "Ursus" and the newsletter "International Bear News", fund research and conservation projects, and hold scientific conferences worldwide. Two components of our mission statement are to "Support sound stewardship of the world's bears through scientifically-based population and habitat management" and "Provide professional counsel and advice on issues of natural resource policy related to bear management and conservation." We appreciate the opportunity to comment on the draft plan to restore grizzly bears to the North Cascades Ecosystem (NCE) in Washington State.

The grizzly bear existed as the apex predator in NCE until recent times, but the population was decimated by over-killing during the last century. Similarly, the North Cascades National Park, within the NCE, lacks grizzlies and it is consistent with the mission of the National Park Service to correct the imbalance that exists without the presence of this apex predator. The ecological importance of apex predators has been demonstrated in many studies including Jacoby et al. 1999; Terborgh and Estes 2010; Estes et al. 2011; Ripple et al. 2013, 2014. Grizzly bears south of Canada are currently listed as "threatened" under the US Endangered Species Act (ESA). The NCE has been identified as one of 6 areas south of Canada that retain all the elements necessary to support recovery of a healthy grizzly bear population in North America, including bear foods, remoteness, large landscape extent, and large areas of public land ownership, including National Parks. The ESA requires that plans be developed for recovering grizzly bear populations in all six of these areas. In the NCE, grizzly bears are classified as "warranted but precluded" for uplisting from "threatened" to "endangered" status. There is no evidence that a permanent population of grizzly bears has existed in the NCE since the species was listed in 1975, although, as noted in the draft EIS, individuals have been sighted there on rare occasions. In Canada, immediately north of the US-Canadian border and adjacent to the NCE, there is also no confirmed grizzly bear population; Apps et al. (2014) suggest the population is extinct there as well and is highly threatened in disjunct areas a bit further north.

There is no evidence that any natural recovery of a grizzly bear population has occurred in the NCE on either side of the US/Canada border since grizzly bears were listed in the US. Based on this experience and the NCE's isolation from other grizzly bear populations, there is no reason to believe that restoration of bears to the NCE can be accomplished with the "no action" alternative "A" proposed in this EIS. Intentional specific actions, as proposed in

alternatives B - D, are essential for restoring a viable grizzly bear population to the NCE. In the portion of Canada adjacent to the NCE, road densities may be high enough north of Highway 3 to hinder restoration of grizzlies there, but south of Highway 3, environmental conditions remain good for sustaining a population (T. Hamilton, BC Government [ret.] personal communication).

We commend the US National Park Service and the US Fish and Wildlife Service for the draft EIS which is comprehensive in scope and presents 3 reasonable action alternatives. We recommend adoption of action Alternative "C" (incremental restoration) as being the most likely to result in acquisition of the information on limiting factors that is required to ultimately restore a successful population with the minimal number of bears lost to avoidable mortalities. Additionally, we believe it is possible that a successful breeding population likely can be established with the translocation of 25 bears using the protocols described in the EIS for Alternative "C". If experience indicates that problems are arising, such as low encounter frequency between males and females, this can be addressed by introducing more males or by switching to Alternative "D" as outlined as a fallback in the draft EIS.

It is our opinion that Alternative "B" (Ecosystem Evaluation Restoration) would involve translocating too few bears initially (10) to permit adequate evaluation of factors limiting success. Alternative "B" therefore would likely result, in time, in the decision to subsequently implement Alternative "C" or to repeat "B" with an additional small sample of 10 bears. Experience with black bear restorations as well as brown bear restorations in Europe indicate that the 4-year evaluation period proposed for Alternative "B" is too short to meaningfully assess population recovery, particularly with such a small number of bears. Alternative "C", because of the larger number of translocated bears, would better enable identification of key problems and allow more accurate inferences about limiting factors and how best to overcome them during further translocations. Further, some costs, such as capture, reintroduction, monitoring, and information-education could be reduced on a "per bear" basis by amortizing these costs over more bears.

Alternative "D" (Expedited Restoration) would also be acceptable. However, this alternative would reduce the ability to adequately, expeditiously, and economically adjust to mortalities that occur and to prevent unnecessary avoidable losses of bears (responsive management). Avoidable mortalities could reduce popular support for population restoration, including among people generally supportive of restoration efforts, and we suggest that the more gradual approach of Alternative "C" would prove more effective at avoiding unnecessary mortalities. Moreover, we believe that a more gradual approach, as long as some reproduction is documented within 5 years after initiation of translocations, is also likely to reduce public concerns and opposition to restoration efforts.

It is our opinion that all the alternatives, especially "C" and "D", would benefit from the management flexibility provided by designating the population as a 10(j) (experimental) population. It is probably inevitable that some "take" will be necessary under a 4(d) exemption. The rule for section 4(d) take should make it clear that killing of bears involved in repeated instances of livestock depredation will be allowed. This is the case in other recovery areas, even without 10(j) designation, and procedures have been developed in these areas to address the concerns of and the consequences to livestock owners. The same stipulations in the 10(j) rule should be clear, including the allowable take of individual bears deemed to be threatening to human safety. These assurances must be made clear from the start in the 10(j) ruling, despite the possibility that it could prompt opposition to grizzly restoration among some people who are opposed to allowing any lethal control of bears.

Though we support a 10(j) ruling, we are concerned that implementing 10(j) and the associated rule-making process will delay the beginning of the restoration, which has already experienced delays since the current EIS was published in January 2017. For this reason, we recommend proceeding with the 10(j) rule-making on an expedited timetable to assure that the current momentum is not lost.

We have several comments and suggestions on the draft EIS that we believe would be useful for you to consider in the process of preparing the final EIS. These are:

1. Be more explicit in the introductory materials (Purpose and Needs statement) for the final EIS that the North Cascades Ecosystem is one of 6 official recovery zones identified in the recovery plan for grizzlies under the U.S. Endangered Species Act (ESA). In these designated recovery areas, the U.S. Fish and Wildlife Service is required by the ESA to develop a recovery plan like the current (draft) EIS. The NCE, therefore, is not an optional area for recovery under the ESA.
2. Give additional emphasis to the importance and need of close cooperation with the government of British Columbia and First Nations peoples and tribal entities on both sides of the border. Cooperative efforts should include comprehensive, long-term, post-reintroduction transborder studies focused initially on movements and habitat use, recruitment, mortality, and human/bear conflicts and cooperatively conducted and funded between US and Canadian scientists. On the Canadian side these studies should focus on the area south of Highway 3 where habitat conditions and road densities are most conducive to reestablishment of a viable population connected to a restored NCE population on the US side. Discussions on restoration

strategies should include Canadian representative(s) from the Ad Hoc group of BC government officials, First Nations representatives, and environmental NGOs, currently chaired by Dr. Garth Mowat (Provincial Large Carnivore Specialist, Wildlife & Habitat Branch, Ministry of Forests, Lands, Natural Resource Operations & Rural Development [garth.mowat@gov.bc.ca]). We suggest that you consider giving this representative(s) a voting seat on the NCE subcommittee of the Interagency Grizzly Bears Committee (IGBC).

3. Consider translocating female bears from a more diverse age class than is currently identified in Alternatives "B" and "C" and more like that in "D". Information from augmentation efforts in the Cabinet-Yaak recovery effort in northwestern Montana suggests that subadult females may be the least likely to exhibit homing movements. The practical logistics of capturing bears, however, include the fact that a bear's age cannot be estimated until it is in hand in most cases. This means that some young adult females without offspring will be captured and rather than releasing them we suggest that such bears might be reasonable candidates to translocate to the NCE. Females without cubs in the fall might be pregnant, based on experiences with black bear (Joseph Clark, personal communication) and European brown bear (Andreas Zedrosser, personal communication) restorations; translocating females immediately prior to the denning period increases chances that they will den in the release area. If they emerge in the spring with newborn cubs and consequently low mobility, it could contribute to the likelihood they will remain in the NCE. In any case, information gained from the movements and behavior of young adult females released in the NCE site will inform future captures and releases. Similarly, age of males targeted for translocation need not be limited to males of 2-4 years of age as indicated for Alternatives "B" and "C". Young males are less likely to exhibit homing behavior than older males (Miller and Ballard 1982) and might be more likely to remain where released. However, for the same practical and logistic reasons as mentioned above, some males up to 10 years, as indicated for Alternative "D", could also be considered for fall translocation.

4. Emphasize translocating bears in the fall to encourage denning in the recovery area. This recommendation is based on the assumption that bears denning in the area will be less likely to attempt to "home" following translocation. Restorations of black bears into the southeastern states were most successful during winter when bears were removed from dens to be translocated to new habitats (Eastridge and Clark 2001; Murphy et al. 2015, 2018, 2019). Although this winter-release technique is not feasible or advisable for grizzly bears, it is likely that much the same effect can be obtained with captures and releases timed for the immediate pre-denning period. Numerous studies have shown that pregnant females are the first to enter dens in the fall (e.g. Servheen and Klaver 1983, Miller 1990, Van Daele et al. 1990, Clark et al. 2002, Haroldson et al. 2002, Schwartz et al. 2003, Pigeon et al. 2016). For males, fall release is also most recommended. However, once there are estrous females established in an area, male bears that have reached breeding age may be more likely to stay near their release site if translocated during the breeding season. In all cases, we strongly recommend taking a scientific approach to designing and documenting the results of translocation protocols. This will allow those implementing the restoration to compare methods and then adapt. Little will be learned if the protocols are done haphazardly.

5. The information gained from the reestablishment of black bear populations cited above should be better exploited to inform the final EIS. Similarly, experiences gained from restoration of brown bear populations in Europe, such as in northern Italy, may be informative. There, 7 females and 3 males, taken from a source population in Slovenia, were released during 1999 - 2001 to augment a critically low population, and the lower threshold of a minimum viable population (goal of 40 - 60 individuals) was reached in 2012 (Mustoni et al. 2003, Tosi et al. 2015).

6. The draft EIS is perhaps too specific and limited with regards to source populations. Now that trophy hunting is no longer allowed in British Columbia (since 2017), there will likely be less competition for bears to translocate from hunters and guide outfitters. Regardless, it seems sensible to not limit potential source stocks in the final EIS by specifically identifying them. Obviously, it would be less expensive to get bears from areas closer to the release site and such nearby bears may be preferable from some standpoints (such as possible genetic adaptations to local conditions). On the other hand, bears from more distant areas may provide additional genetic diversity and corresponding resilience. Brown bears were restored successfully to southern France (Quenette et al. 2001) and northern Italy (Tosi et al. 2015) from Slovenia--distances of >1600 and >400 km, respectively. It is necessary, of course, to translocate bears from source populations that have similar food economies to what they will experience in the NCE (plants, berries, ungulate neonates).

7. The above comments on sources notwithstanding, new evidence of potential problems to the health of bears translocated to the area has come to light since the draft EIS was written. This concern needs to be taken into consideration in the final EIS. Robbins et al. (2018) identified an encysted fluke (*Nanophyetus salmincola*) containing an endosymbiont in Chinook salmon (*Oncorhynchus tshawytscha* and possibly other species of Pacific salmon) from US Pacific Northwest states that may cause salmon poisoning disease (SPD) in bears exposed by eating infected salmon. This means that the potential for grizzlies introduced into the NCE to feed on infected salmon must be analyzed in the Final EIS. As suggested by Robbins et al. (2018), this new complication might also mandate studies to see if black bears endemic to the NCE have been exposed to this

pathogen. Further studies on the development of resistance to SPD may also be warranted as suggested by Robbins et al. (2018).

8. Translocations of large numbers of grizzly bears are rare. The draft EIS considers the personal safety of biologists involved and mortality risks to bears. The final EIS would benefit from mention of the 1979 experience in Alaska, when 49 grizzly bears were translocated from a study area during spring, by helicopter, fixed wing aircraft, and truck, as part of a moose calf survivorship experiment (Miller and Ballard 1982). During this effort, one bear died during capture and no biologists were injured (S. Miller, Alaska Department of Fish and Game [retired] personal communication). In 1979, immobilization drugs available were less safe for bears than those currently available that are used widely on all bear species (Cattet et al. 1997, 2003).

9. When translocations occur, it may be helpful to encourage bears to remain in the immediate release area by perhaps pre-positioning road kill ungulate carcasses at release sites especially in remote high elevation sites unlikely to be inhabited by black bears. Such efforts have yielded mixed results (Gordon Stenhouse, personal communication), however, they might help to keep newly translocated bears close their release sites.

10. We believe the cost estimates for action alternatives listed in Appendix Table D-3 are reasonable. We note, however, the absence of estimates for documenting changes in population abundance. Assuming bears successfully reproduce following translocation, we suggest this type of monitoring needs a well thought out design, and would be based on creating a genetic database, initially from biological samples taken from every individual translocated to the NCE or handled thereafter; the database would be updated with opportunistic collection of hair and scat samples (DeBarba et al. 2010). In time, this could form the basis for periodic and systematic sampling for population monitoring (Bellemain et al. 2005, McLellan et al. 2019). The EIS should also indicate if and how radio-collars will be used to monitor bears translocated into the NCE (Preatoni et al. 2005).

11. If translocation of bears to the NCE is successful, the hope is that the population will grow. It will be necessary to monitor population growth and, in the long term, achievement of the desired target of 200 individuals; this will require considerable long-term funds in addition to the estimated costs itemized in Table D-3. We suspect that the most cost-effective means of monitoring population growth with minimal disturbance will be based on DNA hair-snaring and rub tree studies (e.g. Kendall et al. 2009, 2016, McLellan et al. 2019). Additionally, we recommend that the final EIS be specific about what age cohorts will be included in the targeted population of 200 bears (i.e. with cubs and yearlings be included or just independent bears?). We suggest that the target be 200 "independent" bears (bears > 2.0 years old). Thank you for your consideration of these comments.

Correspondence: Hello, I'm not an expert, just a hiker. I'm not sure what your objective is. Large mammals, including wolves, mountain lions and grizzlies, scare me. I don't see what the animals gain from being deliberately introduced. There's always going to be conflicts. I guess if they came down from Canada on their own, leave them. But why introduce them?

Many brown bears inhabit areas close to where I live in Newcastle. People get them in their yards in Issaquah and elsewhere all the time. They get a taste for people food and trash, to the point that some must be killed. I encountered a fairly small brown bear on a trail on Cougar Mt., close to where I live. I'm glad they were interested in the shrub they were eating and not me. I really don't want to encounter a grizzly in the N. Cascades!

I'm sorry this isn't more scientific or statistical. I just want to voice my opinion to not introduce them. I'd hate for someone to die in Washington from a grizzly attack and then F&W has to kill the animal.

Thank you,
[REDACTED]

Correspondence: We are totally against introducing grizzly bears to the North Cascades National Park Complex! You are not "re"introducing! Where is the proof they have ever been here on a permanent level? We would appreciate seeing that proof!

There are already black bears in this area. Introducing grizzlies will eliminate whatever sparse food source is available for them, and there certainly is not enough food source for bears the size of the grizzly, as well as the black bear. One or the other are doomed to die or leave, and my guess is it will be the lesser of the two, so why waste all this time, energy and tax dollars on a project that is doomed, and is also against the wishes of the taxpayer?

A big question we have is who are the actual individuals, not the agencies, but the individuals, who are pushing this agenda? We would appreciate that list, because in the event there is any injury to persons or their animals after the introduction of these very aggressive animals to this ecosystem, we want to know who to file the class action suit against.

The tenacity of the government to interfere with nature on this level and against the interests of the public is astounding. And the failure of the National Park Service to defend the public's right to a safe and enjoyable experience in their national park is unconscionable. It goes entirely against the mission of the National Park Service which was created by the Organic Act of 1916"

" To conserve the scenery and historic objects and the wildlife therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations."

Grizzlies in this area will definitely impair the enjoyment here for future generations.

I repeat, we are totally against the "re"-introduction of the grizzly to the North Cascades National Park Complex.

Correspondence: I support restoring grizzly bears to the North Cascades Ecosystem. These animals hold cultural and ecological significance in the region, and co-existed here for thousands of years before they were extirpated from their historic range in the North Cascades after the arrival of European settlers. Through this reintroduction plan, we have an incredible opportunity to bring back grizzlies, who as a keystone species, have a positive effect on ecosystem functionality. With the numbers of individuals proposed for reintroduction through this plan, it's highly unlikely that I would ever see one in the wild, but I wholeheartedly support bringing them back - help us keep the North Cascades wild and resilient.

Correspondence: Dear NPS: I am fully in favor of grizzly bear recovery in the North Cascades. They are part of the original fauna and belong their. The bears play an important role in a fully functioning ecosystem and need to be restored.

I am a frequent backcountry user and have visited grizzly bear territory many times primarily in Yellowstone, Glacier, Denali, and Wrangell-St. Elias National Parks, The actions we need to take in the backcountry to minimize bear risks are not overbearing and largely mimic the actions we need to take in black bear territory, which is practically everywhere.

In particular, I support the Preferred Option, involving the introduction of a limited number of bears and their designation as a Nonessential Experimental Population. This alternative acknowledges the limitations imposed by our current society but provides a path towards successful recovery.

I wish to thank NPS and its partners for this effort.

Correspondence: Point 1: Restore a grizzly bear population as part of the natural and cultural heritage of the North Cascades. Of all of the objectives listed I think this one is the most important. Reintroducing grizzly bears into a part of the

country where they have lived in the past and making sure that even after they are introduced they can continue to live in that ecosystem in the future is a very important step in the direction of helping grizzly bears get off of the Federal List of Endangered and Threatened Wildlife. For the reintroduction process to be cohesive, the input of the tribes, the NPS of the NCE, and all the residents must be taken into account. One of the objectives in taking action is, to "Provide Pacific Northwest residents and visitors with the opportunity to again experience grizzly bears in their native habitat." Although having Grizzlies around is definitely great for the biodiversity of the Northern Cascades, I am not sure that visitors would be so keen on seeing grizzlies in their natural habitat unless it were through the lenses of some binoculars or a camera. It would be rare for grizzlies and humans to come into contact in the northern cascades, however, if that scenario were to happen with a camper making dinner or a hunter who recently just killed a deer, the end result is almost always a bear getting shot or possibly a human getting severely hurt. Ignoring that scenario, I would say that the positive effects of reintroducing the grizzly bear to the northern cascades ecosystem such as increased biodiversity, an increase in the population of an endangered animal, and, a strengthening in the spiritual connection between tribes and the bear are reason enough to have them reintroduced. The "no action alternative" is also a decent option if the risks of reintroduction to humans are too great. Having bears naturally find their way back west to the northern cascades would take a lot longer for the population to be back to 200, but this option is likely received more positively by the public/people who would be affected by this reintroduction.

Correspondence: I fully support the proposed Alternative C to reintroduce Grizzlies to the North Cascades under the 10(j) clause. While I am enthusiastic about a reintroduction of Grizzlies without the 10(j) clause (under Alternative B), I believe the added management tools provided in Alternative C reach a compromise with other stakeholders such as ranchers, and it is important to have their buy-in on this topic. Generally, I believe that Grizzlies are an important part of the North Cascades ecosystem, so I fully support plans to reintroduce Grizzlies to this area in a way that has as much community support as possible, while still respecting the lives of these animals.

Correspondence: With a lot of trepidation and hesitation, I support the preferred alternative with the 10(j) option. However, I still have strong concerns about whether there will be adequate monitoring of the bears and sufficient preventative measures taken to reduce the chances of human-bear interaction and risks to human safety.

The North Cascades has many more people recreating in it than it did even 25 years ago when the recovery zone was initially put into place. And if the bear population does reach the point where some migrate into the southern portion of the NCE, then there will be even higher chances of human-bear interactions and problems.

Snoqualmie Pass/Alpine Lakes? Mt. Rainier National Park? Whoa. Those are areas with far more people out recreating than the North Cascades. And that does not account for how many more people will be out there in 60-100 years when the bear population has grown. Greater encounters and problems will be bad news for the bears as well as the people.

I noticed in your presentation (during the FAQ portion) that one of the suggestions to prevent bear problems in the backcountry is not to hike alone. For many people, that isn't practical. I live alone and do the majority of my hiking alone with my two dogs. The dogs keep me company and obviously can act as an early warning system, but obviously they also could cause more issues for themselves and for me if we were to encounter a grizzly.

If I were planning a hike, I would sure want to know where the grizzlies were at that time. Live monitoring capability to give

people an idea of the area they might be currently frequenting would help in deciding where to (or not to) hike.

Here are some questions and issues I hope NPS and USFW will answer for the public and address if bears are reintroduced:

What plans do NPS and USFW have in place for 'real time' monitoring and for alerting the public about current bear activity?
A sign once you get to the trailhead is not sufficient.

How closely/how often will the bears be checked on/monitored?

Will they be microchipped in addition to wearing collars?

Will monitoring be applied to Canadian bears that may cross into the North Cascades once Canada reintroduces grizzlies?

What plans do the agencies have for on-the-ground (i.e trailheads, campgrounds, along HWY 20 and access roads, in communities next to North Cascades) education and communication with people recreating?

Correspondence: Howdy again

A couple of things I noticed in the Draft:

First, several times you mention that reintroducing grizzly may increase tourism. I believe it will be a net reduction in tourism on trail and campground use. I intend to hike the same amount as before introduction, not more or less. But, many of the folks that I regularly hike with at least say they will not hike where grizzly are present. Why do you suggest a net increase possible after reintroduction?

You compare the North Cascades to Yellowstone. I do not think you can do that. Yellowstone has lots of roads and most of their trail use is geyser or thermal feature short paths with lots of use. The large amount of people around these thermal feature makes bears avoid these areas. My experience at Yellowstone suggest that folks do not in significant numbers use many of the trails. Some years ago while at the Old Faithful Area, I went on a 6-7 hour day hike into a remote geyser. While there were many hundreds of folks in the Old Faithful geyser area, I saw no one on my hike. So saying millions of folks do not have bad encounters with bears is misleading. You are cherry picking your statistics.

You say several times that you do not anticipate trail or area closures except for short periods. I do not think you are being realistic. It may be true in the first few years, but I think you will at some point in the future you will be more like Yellowstone where there are a dozen areas that have multi week or month closures every year. How are you going to avoid these type of closures in the future in the North Cascades? How will tourism increase if large areas are closed or restricted in the North Cascades?

Correspondence: After reading the draft EIS, I am left with no confidence in the DOI, USFW, NPS and their experimental plan to introduce grizzly bears into the NCE.

These departments, along with the IGBC, seem to be rushing towards a final EIS with their chosen action alternatives B or C and with blatant disregard to the neighboring communities who do not support the action alternatives.

Here are some of the many concerns I obtained from the draft EIS:

- Vague spiritual and cultural tribal reasons without any actual tribal support.

As a tribal member of the Colville tribe, a direct descendant of Wenatchi, Entiat and Mose-Columbia tribes, and with other family connections to tribes in WA, OR, MT, and CA, I am not convinced there is any large amount of local tribal support for the action alternatives B or C.

Non-tribal supporters are being lied to and misled by this draft EIS with very vague "spiritual and culture heritage" reasons for taking action.

Moreover, the Environmental Justice section on page 16 implies that the members of the Colville tribe, with a minority and low-income population, was not included from further analysis as it was determined they "would not be disproportionately affected" because "restoration activities would not be focused" in the nearby reservation, which includes the town of Omak.

Way further down on page 156, the drafters of this plan interestingly recognize local tribes traditional territories. What was suspiciously left out was that the Colville Reservation (where local tribes were forced to relocate to) once included the "North Half" which encompassed a larger area than the present day reservation. Additionally, the Mose-Columbia reservation included the area between the North Half and into the Cascades Mountains where the parks now exist. The Wenatchi tribe (one of the twelve tribes included in the Colville Tribes) was promised a reservation in their traditional territory around where Wenatchee, Cashmere, and Leavenworth are today. (Also troubling is the residents of Chelan County were not scheduled an in-person meeting for the draft EIS proposal held in their county.)

It is wrong of the drafters of the EIS to not include the minority and low-income populations of the present day towns in Okanogan and Chelan counties from analysis on whether they would be disproportionately affected by grizzly bear

restoration. By not including tribal members and direct descendants who still populate these counties, the drafters of the EIS appear to not be concerned for the safety of tribal communities, and plan to not be held liable for any negative impacts. Again, the drafters defer to vague spiritual and cultural reasons in order to gain supporters from non-tribal people for their action alternatives B and C.

Furthermore, the Ethnographic Resources sections acknowledge that grizzly bears will negatively impact tribal hunting, root gathering, huckleberry picking, and additional tribal activities, many of which are private and sacred.

How again is the introduction of bears a benefit to the Washington State North Cascades tribal communities? The drafters of the EIS cannot pick and choose portions of indigenous cultures to support their agenda while actively planning to negatively impact or damage other portions. It appears the bears are expected to stay within their own NCE reservation. Every tribal community understands the bears ranged down and beyond the Columbia River, something which non-tribal supporters seem unaware of. Grizzly bears were also hunted by tribal communities, something non-tribal supporters seem to want to overlook. Probably because they are being guilted by the biologists of this draft EIS into righting some perceived wrong of the past ("white hunters hunting down the last grizzly in the Cascades.") The action alternatives of the draft EIS are no better than colonization.

- Absolutely no indication from the departments and agencies behind this plan that they will 1) cease the experiment if it goes terribly wrong and 2) claim responsibility ahead of implementation.

It is terrifying that the group of educated people behind this draft EIS have not indicated that they will fully cease the experiment if something goes terribly wrong. There seems to be a lot of "unknowns" in the draft EIS, so it seems that the departments should claim full responsibility of ALL of the outcomes ahead of implementation.

It seems that no number (one or one hundred) of potential human injuries or deaths will stop this group of people from plowing ahead with their goal of 200 bears.

It appears no amount of impact to people's livelihoods, specifically agriculture, will not change the proposed path of this experiment.

In the draft EIS, there are numerous examples where the departments have actually no idea what will happen in 60 to 100 years. The drafters of the EIS will be long retired or gone from this Earth after a majority of the grizzlies are set loose.

It appears the drafter's plan is to just kick the can down the road for the next generation to deal with. The drafters provide absolutely NO solutions to the next generation. How is this any better than the generations that came before us all?

By pushing forward with this plan, the drafters are not better teachers and are not thinking well of the seventh generation.

By not claiming responsibility for the destructive elements of their experiment, the departments behind this draft indicate they will not be held liable for their own actions, and therefore are no better than an eco-terrorist group.

- Climate change is bad for everything, but not for grizzly bears.

In the draft EIS, human-caused climate change is acknowledged to be detrimental for many other predators, prey animals, their food sources and habitats... but climate change is actually good for grizzly bears.

What a ridiculous supporting argument that you all came up with in order to push this plan forward!

In the recent 2023 legislative session, WA state Democrats passed many bills regarding climate change actions. The taxpayers of our state will now be endlessly funding climate change projects. People are actively being informed that, in order to do our part, we will need to upend lifestyles with electric vehicles and no new homes will be allowed to use natural gas. But, here the departments of the EIS are stating we should support introduction because one study shows huckleberries might increase.

- The sole argument to introduce grizzly bears is to remove them from threatened or endangered status. ID and MT are actively addressing de-listing grizzly bears, but officials are conveniently pushing back an answer well after the final EIS for the NCE is implemented.

It seems the Interagency Grizzly Bear Committee has an agenda they want to push onto the state of WA before Idaho and Montana are proved to have too many bears. It's very false and misleading to convince the state of WA that we need to save these "threatened" bears when they are clearly thriving elsewhere in the country.

This plan to introduce bears goes back decades. Now that the bears are obviously recovering and likely becoming unmanageable with more possibilities of lethal take, the drafters of this plan should step down and hold off until after the final decisions are made in ID and MT. Otherwise, the agencies and departments supporting the EIS continue to act as discreditable and dishonest bureaucracies.

- The draft EIS doesn't bother to address how black bears already benefit the ecosystem with seed dispersal, nutrient availability, and forest health.

By not addressing how black bears benefit the ecosystem, the draft EIS again appears to be written in a dishonest manner. We must somehow imagine that grizzlies are a superior species of bear and will perform a miraculous ecosystem recovery. By not addressing black bear benefits to the ecosystem, I cannot support an even deadlier bear being introduced in to the NCE and will never believe that the increased safety risk from grizzlies is outweighed by the supposed benefits of grizzlies. By intentionally leaving black bear benefits out, I will never support the departments for choosing to experiment with human safety under the guise of "ecosystem benefits."

- Using politics as a tool to change the RCW (no grizzly bears from out of state.)

With an upcoming legislative session and a liberal Democratic majority in both houses, the issue of introduction seems planned to become a partisan issue and planned to cause further division. The RCW was mentioned by the IGBC in a meeting years ago, so it's no speculation on my part that the agency and department would factor in the current political climate to try and work in their favor.

It's no doubt there will be a strong effort to try and work around the RCW of WA. Shame on the departments and agencies working towards turning resident against resident on an issue that will affect everyone's safety. As neighbors and residents, everyone on the political spectrum is at an equal disadvantage if any one of us finds ourselves facing a deadly bear in the NCE.

So after the law is changed and the EIS is finalized, non-profits will be funded and employed to educate the public with "tolerance" and "co-existence." The departments and agencies are working to rush this in before the 2024 presidential election, which points to an agenda that further doesn't care about the public's safety or concerns. It instead points to a group of people with degrees lording over the rest, because "we're educated" and "we say so." Very totalitarian.

- Last but not least, agriculture, specifically small family-farms, orchards, apiarists, ranches as well as agritourism, seems to be taking second place to the supposed benefits of grizzly bear introduction.

Why anyone in their right mind would want to willingly make a negative impact to the local food supply is beyond my comprehension. Everyone eats. Agriculture, specifically organic, provides many benefits to the ecosystem. Are the agencies now not in support of healthy pollinator populations? Many farmers are land conservationists. People (such as farmers) who work outside daily, and not just play outside (like hikers), have a strong will to keep land healthy because they know first-hand what it provides. Many supporters of bear introduction are living in their city bubbles, staring at smart phones, do quick weekend activities in the Cascades, and have little idea what it takes to provide food to their local natural food store or farmer's market.

Agri-tourism is safe and educational. Visitors want to U-pick apples and pears in the Fall; not fend off a bear. It takes years, many seasons, and many hands to build a successful farm. Let's not work to destroy what we have gained as North Central WA communities.

To knowingly put farmers, orchardists, beekeepers, and ranchers at a disadvantage means the drafters of this EIS support increased food prices, small businesses going out of business, and families losing their lands and livelihoods. The departments and agencies behind bear introduction are moving the residents of WA from local sources and towards unsustainable dependence other states and foreign countries.

Older experienced farmers are retiring and aging out of the industry. Younger beginner farmers face many hurdles obtaining land. Tools, feed, supplies, and infrastructure are costly. It's not an easy or enticing field to enter, but it's increasingly vital that younger generations become farmers themselves. We should be lifting these young people up and not give them an experiment to deal with for years to come.

Born and raised in WA state, I am a someone who wasn't raised on a farm but figured out around age 28 that I wanted to contribute to food security with my own farm. I am now in my 40s. Throughout my life, I have lived on each side of the Cascade Mountains and in many cities and towns including Arlington, Omak, Auburn, Sumner, Wenatchee, Chelan, Spokane, and Seattle. I have watched as human population and homes increased in formally rural and sparse areas of our state, as well as the increased tourism to formally rural and sparse areas of our state.

Since 2010 as people fled disgusting Seattle for a more rural life East of the Cascades, the housing inventory quickly dwindled in my hometown of Wenatchee. Prices increased. There became a housing shortage. Old orchards were destroyed for housing developments. It took me many years to find a home with acreage in North Central WA. I'm not about to lose what I wish to gain with my new farm, because biologists have decided we are lacking a grizzly bear experiment.

The draft EIS indicates that tourism may increase for those wishing to "experience" grizzly bears in the NCE. I do not agree that we are lacking a tourism industry for this "experience" nor is it a viable benefit to our state. Every year, tourists irresponsibly raft and need rescuing on the Wenatchee and Icicle Rivers or irresponsibly hike/rock climb/Instagram and need rescuing in the Cascades. These ill-equipped and uneducated visitors place a heavy burden on the local rescuers and underfunded medical facilities who work to save their lives. Natural attractions such as rivers and mountains are unmovable; they will always attract the foolhardy. Purposely creating a "zoo" in the wild and launching grizzly bear maulings onto communities with limited services is an unwise financial undertaking. Shame on the officials for encouraging this stupid idea.

The area where I attended high school, Lake Chelan and Manson, rely solely on tourism and agriculture. Popular boat cruises bring travelers and employees into Stehekin and Lucerne - right where the departments know the grizzly bears will roam. The incredibly crowded and growing communities that live and work throughout the entire Lake Chelan area would be negatively impacted by grizzly bear introduction and will see no supposed benefits.

Leavenworth and surrounding areas already have increasing unwanted encounters with black bears. This is another area heavily reliant on tourism and is filled with farms, orchards and ranches. These communities will be negatively impacted by grizzly bear introduction and see no supposed benefits.

Many ranchers and farmers drove down from the Methow Valley to speak against introduction of bears at the in-person meeting in Okanogan. The towns of Mazama, Winthrop, and Twisp, even with their liberal-voting eco-minded population, will without a doubt be negatively impacted by grizzly bear introduction and will see no supposed benefits.

Concerned residents from neighboring counties drove hours to attend the Okanogan meeting and to speak against introduction. Retired wildlife professionals with working experience in Alaska and Montana spoke against introduction. The majority of Okanogan County residents at the meeting spoke against introduction. Every former and current LEO that I know is against introduction. Every town from Oroville to Brewster will be negatively impacted by grizzly bear introduction and will see no supposed benefits.

I attended the Okanogan meeting with an open mind willing to accept that my view might change after listening to officials. So, that didn't happen, because the officials had nearly nothing to present except portions of the EIS on placards. One physical copy of the draft EIS was present which no one could take home. I saw no real effort by officials to encourage people to support the draft EIS.

After I paid for a physical copy of the draft EIS and read the entire draft, I can further see why. As a tribal member, a new farmer, and a lifelong Washington resident, there is nothing in the draft to support except the non-action alternative A. No Action. No to grizzly bear introduction in the North Cascades. Not now. Not ever.

Correspondence: I live in the proposed reintroduction zone and do not want to encounter a grizzly bear. In recent years, grizzlies have been known to attack and kill humans, at times without apparent provocation. I carry a pistol in the woods in case of threat from other animals that inhabit my area, namely wolves and cougars. My pistol will not save me, my family, or pets from a grizzly. They are dangerous, powerful animals and should not be introduced to areas where they do not currently reside, especially when encounters in human habitation areas are probable. Don't make me fear for the lives of my loved ones and have to consider moving away from my home.

Correspondence: I do not favor Grizzly reintroduction. The risk to people from grizzly bears is too great. In addition to the likelihood of dangerous or fatal encounters, the remoteness of the area--all the areas in the reintroduction plan, not just North Cascades National Park--makes rescue and care for people affected or injured by grizzlies much more difficult and costly.

There will also be an adverse economic effect on the region as grizzly presence will reduce visitation and use of the areas by recreationalists and others.

Correspondence: I appreciate the opportunity to comment on the "Draft Grizzly Bear Restoration Plan / Environmental Impact Statement" for the North Cascades Ecosystem. I am retired and now split my time roughly 50/50 between Seattle and Stehekin. For the last 50+ years I have spent a lot of time within the boundaries of the "North Cascades Ecosystem" (NCE) pursuing recreational activities including hiking, backpacking, backcountry skiing, climbing, kayaking, ... For about the last 20 years, I have lived part time in Stehekin. I have missed experiencing the presence of grizzly bears that were once in the NCE. I hope that those following me in the NCE will have the opportunity for that experience through reintroduction of grizzlies through this restoration plan.

I have read the "Executive Summary" of the "Plan" and scanned much of the text. With that information, I can say:

I do not support Alternative A: No Action. It really is no action, based on the discussion of the very low probability that a viable grizzly population could develop through grizzly immigration into NCE from Canada.

I strongly support the active reintroduction of grizzlies laid out in Alternatives B and C.

I prefer Alternative B, which expresses the strongest commitment to maintaining a viable population of grizzlies identified as a "Threatened Species" managed under the requirements of ESA 4(d) rule.

I understand motivations for Alternative C arising from potential conflicts related to public service facilities or private property with in or adjacent to NCE. I have some concern about the proposed solution through designation of grizzlies as a "Nonessential Experimental Population" (NEP) to be managed under ESA10(j). My concern is somewhat relieved by almost all of the NCE being within NEP Zone 1. (Fig. 4). My understanding of the comparison of ESA 4(d) and 10(j) (Table 2) is that there is little difference in Zone 1.

Correspondence: Thank you for the opportunity to comment on this important issue. I appreciate the thoughtfulness of the federal agencies involved to ensure you hear from the public that care deeply about this issue.

When settlers arrived in Washington and other Western States, they began a massive extirpation campaign of wild inhabitants like the Grizzly bear, grey wolf, and other species that they viewed as competitors and threats to their exotic livestock. The biodiversity and resilience of our ecosystems have suffered greatly since strongly interacting species like bears, wolves, and beavers were removed from these systems that they co-evolved with. The Endangered Species Act is this country's recognition of these egregious wrongs, and sets a path for agencies to correct for these past mistakes and try to make these systems our very lives depend on whole again, and requires federal agencies to take actions such as the restoration of grizzly bear populations you are now proposing.

I welcome the restoration of grizzly bear populations to the North Cascades. I have hiked in bear country in Alaska and Montana in this country, and in countries in Europe that have recovering brown bear populations, and understand and accept

both the behavioral changes necessary to be safe in brown bear country, and the risks associated with it.

I strongly support the federal agencies' efforts to restore grizzly bear populations to Washington State's North Cascades Mountains, where conservation science shows there is ample bear habitat and prey for bears.

Thank you for accepting my comment in support of your proposal.

Correspondence: Dear Sir or Madam,

Below are comments from FWP related to the Draft Grizzly Bear Restoration Plan/EIS for restoration of grizzly bears in the North Cascades Ecosystem (NCE). The State of Montana does not offer herein a position on an alternative, but rather provides considerations and concerns about the grizzly bear restoration plan for the North Cascades. FWP also separately provided comments on the proposed 10(j) rule that would be necessary for implementation of Alternative C.

First and foremost, it is absolutely imperative that this effort, and the subsequent need for bears for this effort, not influence delisting of either the Northern Continental Divide Ecosystem (NCDE) or Greater Yellowstone Ecosystem (GYE) populations. These populations are recovered, and delisting must be a top priority for the USFWS.

The restoration plan identifies as one of the needs "to support the recovery of the grizzly bear to the point where it can be removed from the Federal List of Endangered and Threatened Wildlife" (Restoration Plan page 3). Montana supports this need, but it is unclear how that can be met with a stated recovery objective of 200 bears in the North Cascades. A better explanation of how the NCE fits within overall grizzly bear recovery and delisting would be beneficial, as would a clear explanation of what would be needed to designate and delist the NCE as a distinct population segment if it met its recovery goal. This should include a discussion on long-term expectations for effective population size, genetic management, and ultimate distribution.

The Draft Grizzly Bear Restoration Plan/EIS identifies the boundaries of the recovery zone, based primarily on federal land boundaries, but fails to identify the areas grizzly bears may inhabit if the restoration plan is successful (i.e., the greater NCE). The analysis is focused primarily on just the recovery zone and implies that is the only place grizzly bears are expected to be. This ambiguity frustrates meaningful public comment. FWP recommends that the area be defined and depicted on a map, with an opportunity presented for additional public comment. At present, one could infer from this restoration plan and the proposed 10(j) rule that the NCE is most of the State of Washington.

Grizzly bear recovery has been ongoing in Montana for at least four decades. This includes recovery of the NCDE and GYE ecosystems, augmentation and recovery in the CYE, and management of bears in transition areas, even as bear populations have significantly expanded. FWP and the USFWS have learned a lot during that time, but it seems much of what has been learned is being ignored and the same biased or incorrect assumptions are being carried forward into this proposal. This includes: assuming bears will only stay on protected federal lands and will not move onto, or create a management concern on, private lands; assuming minimal efforts, like food storage regulations on public lands, will alleviate most conflicts;

asserting that source bears must come from the same “food economy” as where they are going; assuming that bears to be used for this effort will be easily captured; and assuming that only bears with no history of conflict can be moved. Starting with these outdated, disproven assumptions will limit the success of this effort. FWP encourages the USFWS and partners to really look at what stakeholders have learned from over 40 years of recovery efforts and based on that, anticipate, plan for, and communicate the most-likely outcomes upfront. Do not soft-pedal or minimize the difficult challenges associated with this effort, but rather recognize the capacity and resources needed to adequately manage bears and bear conflict, and get those resources in place well before they are needed. The USFWS should defer to states in determining the scope and scale of impacts of Endangered Species Act (ESA) actions to state and local communities as they are ones facing those impacts. Montana is concerned that the USFWS is summarily concluding that impacts will be minimal without providing the State of Washington a full narrative of the costs and impacts of grizzly management from other states. Allowing the USFWS to determine what the state and local impacts of an action sets a concerning precedent for other states, including Montana.

The State of Montana is concerned that this proposed rule will divert resources from other higher priority grizzly bear recovery efforts. Currently the NCDE and the GYE populations have met, and exceeded, recovery criteria. Yet, the USFWS has not successfully delisted these bears. Given that the USFWS has not directed any additional resources towards grizzly bear management, FWP is concerned that resources and capacity in the Grizzly Bear Recovery Program and Ecological Services program are being, and will continue to be, diverted to the NCE effort at the expense of recovery and delisting efforts (i.e., rulemaking) in the other more established ecosystems. The USFWS highest priority should be completing the delisting process for recovered populations (NCDE and GYE) including the necessary remnant analysis. Along those lines, the Restoration Plan provides an estimate of anticipated costs to implement the proposal (Appendix C), but provides no commitment of resources to address those costs, and fails to anticipate increasing costs as the population increases, including resources needed for implementation such as the capture and translocation of bears, and subsequent management, monitoring, and conflict prevention work. As should be obvious from the GYE and NCDE, and even the CYE, significant staff and financial resources are necessary to successfully restore, recover, and manage grizzly bears. In Montana and Wyoming, most of that responsibility has fallen on the state fish and wildlife agencies outside of the National Parks, requiring those states to contribute several million dollars per year. We strongly disagree with the note at the bottom of Table C-2 implying that funding for conflict specialists, monitoring technicians, and livestock damage preventative measures will not be needed in the near term. Montana has learned that these types of resources need to be in place to prepare an area for when bears show up, versus responding after the fact.

FWP currently has 12 full-time bear conflict positions plus additional seasonal positions to address and prevent grizzly bear conflicts. FWP also has four full-time positions focused on monitoring the NCDE grizzly bear population. The U.S. Geological Survey grizzly bear study team consists of several staff dedicated to monitoring the GYE population. The minimal funding provided by the USFWS for this work has been reduced in recent years while the population, and resulting conflict work, has expanded. Increasing grizzly bear distribution without a corresponding commitment of resources is irresponsible and results in reduced tolerance for grizzly bears and, more generally, the ESA. There should be a clear plan in place ahead of time, detailing what these expenses are projected to be and how these expenses will be covered, including bear trapping and transport costs, bear conflict specialists, conflict response costs, conflict prevention costs, and necessary ongoing monitoring. Funding for those expenses should not come from diverting funds from existing recovery efforts, especially while those populations remain listed.

Throughout the proposed rule, the USFWS alludes to work that has been or is being done to minimize conflict, and based on that, concludes there will be minimal impacts to grizzly bears or people if the reintroduction occurs. While we applaud that “substantial outreach efforts have been put in place by the National Park Service (NPS) and U.S. Forest Service over the last 30 years to reduce unsecured attractants (e.g., garbage, human food) and provide the public with tips on identifying and coexisting with grizzly bears,” (88 FR 67199) we know from experience that much work remains to be done, especially given the proximity of the recovery zone to the large human population in the nearby Puget Sound, and the increasing interest in outdoor recreation. It seems disingenuous to indicate otherwise, given the scale and scope of effort needed to prepare and maintain the landscape for grizzly bear presence, and associated costs. Passing a food storage rule and assuming everyone will follow it is overly optimistic. It should be obvious from experience in the GYE and NCDE that, although needed, this is the minimum effort, and that ongoing education and enforcement is also needed, especially as bears expand into new areas. Montana is hesitant to support removing bears from the NCDE or GYE that will likely come into conflict because of inadequate conflict prevention measures. This is no different than moving wildlife to inadequate habitat or

areas where threats have not been addressed and expecting them to survive.

The Restoration Plan suggests that the source of bears for the reintroduction will likely be the NCDE and possibly the GYE (five to seven bears per year), and that because the populations in those recovery ecosystems are so robust, impact to those populations will be minimal. The Restoration Plan goes on to state the reintroduced population will receive ongoing demographic support (population augmentation) from source populations to replace bears that die or are killed until a population of 25 individuals is achieved. It appears the USFWS is maintaining space to translocate an infinite number of bears without committing the necessary resources to minimize mortalities. While Montana appreciates USFWS' recognition of the NCDE and GYE successes, the restoration plan and need for bears for translocation has not been discussed with the states that functionally manage these populations, despite assertions of "coordination."

Specifically, the restoration plan states:

Under both action alternatives the restoration plan anticipates capturing and releasing 3 to 7 grizzly bears per year for 5 to 10 years to achieve an initial population of 25 bears. The capture and release of grizzly bears would take place between June and September each year. Release site(s) would be selected based on quality of food in the release areas. Grizzly bears that would be considered ideal candidates for capture and release would be typically independent subadults between 2 and 5 years of age that had not yet reproduced and had exhibited no history of human conflict. The target sex ratio for initial releases would be approximately 60% to 80% female and 20% to 40% male. Under both action alternatives once an initial population of up to 25 grizzly bears is achieved, a transition to the adaptive management phase would occur. In this phase, additional grizzly bears could be released to address human-caused sources of mortality, genetic limitations, to improve population distribution and sex ratio, or to mitigate the potential for long-term genetic isolation.

The proposal implies augmentation from the NCDE to the CYE also is expected to continue. Montana, Idaho, and Wyoming have agreed to genetically augment the GYE population with bears from the NCDE as well. The restoration plan fails to acknowledge these competing needs. Additionally, the restoration plan suggests only bears with no history of conflict would be used, and preference would be skewed towards females, which have a lower mortality threshold. A management challenge in the NCDE and GYE is relocation of bears that have been in minor conflict or potential to get into conflict, so we recommend the NPS/USFWS consider taking bears that may have some conflict history - a position that would actually assist the states and increase support for removing bears from the NCDE and GYE populations. Being more flexible in criteria will increase likelihood of success and cooperation from source states.

Montana is also concerned about limiting bears for translocation to those from similar "food economies." This is a requirement that has been in place in the CYE but is not based on any supporting information. The best available science indicates bears are food generalists and can adapt to varying availability of different food types. Continuing this unsupported requirement of having to come from the same "food economy" will significantly reduce the number of bears potentially available for translocation, as well as reduce support for taking them from source areas.

Our experience with the CYE augmentation program is that trapping the ideal bear (sub-adult female, non-conflict, similar food economy, in June-July) is very difficult and time consuming, and generally results in less than one bear moved per year. It is unlikely five to seven bears meeting the proposed restoration plan's criteria could be captured each year, especially if bears are also needed for the CYE and GYE. FWP encourages the USFWS to analyze the resources that have been required for the CYE augmentation program and adjust expectations and resources needed accordingly, to include staff, vehicles, culvert traps, handling supplies, radio collars, etc. The budget for this in Table C2 seems low for the proposed work. The restoration plan preferred alternative includes management zones that encompass most of the State of Washington. These appear to be modeled somewhat after the management zones in the NCDE Conservation Strategy, or the Management Situations in the 1986 Interagency Grizzly Bear Committee guidelines, although they are not defined clearly in the document. We find it ironic that non-federal portions of the North Cascades Recovery Zone are considered Zone 3, as are "inholdings" within Zone 2 areas where bears will not be managed, if we read the zonal descriptions correctly. This implies that recovery and occupancy is expected to only occur on federal lands, and primarily only on federal lands within the recovery zone boundaries. As noted previously, this ignores what has been learned in the NCDE and GYE regarding grizzly bear habitat use and even where bears are showing up in the Bitterroot. They do not honor federal land boundaries. The USFWS should expect and plan for grizzly bears utilizing a diversity of contiguous lands and landownerships or be more explicit in how it will manage for grizzly bears on public lands alone. The Zone 2 designation implies bears are expected in an area much larger than the designated recovery zones, since Zone 2

lands are intended "to accommodate natural movement or dispersal of grizzly bears" (Restoration Plan, page 36). It is unclear how that corresponds with the recovery plan and reinforces the need to plan and budget for management and monitoring at the scale grizzly bears are expected to occur (i.e., all of designated Zones 1 and 2), as well as ensure the resources are available to address management and conflicts in the remaining areas (i.e., Zone 3). The logic of designating a large area of Zone 2 to the east of the recovery zone, separated by Zone 3, is unclear as well, especially since Zone 2 area appears to only be public lands.

To our knowledge, there are no established recovery criteria for grizzly bears in the North Cascades beyond the stated recovery goal in the restoration plan of 200 bears. The restoration plan estimates the North Cascades has capacity for 200-400 bears but cites no supporting information or science supporting the adequacy of this number. There is nothing in the proposed rule that indicates this is adequate for recovery and delisting of this recovery area (a requirement of recovery of the lower 48 listed entity), or if genetic connectivity or genetic augmentation will be required. This is important to understand as it potentially impacts other recovery areas (e.g., Cabinet-Yaak-Selkirks) and/or source populations for augmentation. As stated previously, it is imperative that this proposal not impact recovery and delisting of other recovery area populations.

Finally, the preferred alternative appears to contradict itself as to the importance of the NCE towards grizzly bear recovery. In the background section, it states that recovery of grizzly bears in each of the six recovery zones is necessary for recovery of the species, which means it is no longer threatened with extinction. Yet, the proposal makes the case that the NCE population is not essential, which implies the population in that area is one whose loss would not be likely to appreciably reduce the likelihood of the survival of the species in the wild, and therefore is not necessary for complete recovery in the lower 48.

The North Cascades presents an opportunity to take lessons learned from more than 40 years of grizzly bear recovery work and apply it in a way that provides the best chance for success. Those lessons include recognition that grizzly bears require intensive management, which requires extensive resources. Those needs should be identified, provided for, and committed to long term before any bear is moved. Failure to do so will result in lack of support for recovery efforts in the communities where support is critical for success. Grizzly bears will occupy a diversity of habitats, regardless of landownership or zonal designation. It is naive to think that there will only be bears on public lands, unless the intent is to manage bears to exclude any that wander onto private land. If that is the intent, then many more bears will be required to achieve a desired population. The zone designations are illogical, especially when there are Zone 3 areas between Zone 1 and 2 areas, and within the core recovery zone. Broader consideration of source bears is necessary to ensure adequate numbers can be achieved, and to help address concerns of source areas. Limiting source bears to young, female bears with no history of conflict and from areas with a similar food source will greatly increase the time and cost to capture bears, and likely will not be supported at the proposed levels. The NCE recovery effort cannot come at the expense of current and ongoing recovery efforts, and absolutely must not influence delisting of the GYE and NCDE populations.

Thank you for considering our comments. We welcome any opportunities to discuss them with you further.

Sincerely,

Director

RE: Draft North Cascades Grizzly Bear Restoration Plan/ Environmental Impact Statement and Proposed Rule:
Establishment of a Nonessential Experimental Population of Grizzly Bear in the North Cascades Ecosystem

Dear Superintendent Striker and Supervisor Thompson:

The National Parks Conservation Association (NPCA) submits these comments specific to the National Park Service (NPS) Draft North Cascades Grizzly Bear Restoration Plan Environmental Impact Statement (draft EIS) and the U.S. Fish and Wildlife Service (FWS) Proposed Rule: Establishment of a Nonessential Experimental Population of Grizzly Bear in the North Cascades Ecosystem (proposed 10(j) rule) to determine how to restore grizzly bears to the North Cascades Ecosystem (NCE). NPCA urges the implementation of Alternative C: Restoration with Endangered Species Act Section 10(j) Designation, the identified preferred alternative, with some modifications to the proposed 10(j) rule. Alternative C will ensure the restoration of grizzly bears to the NCE, while providing increased management flexibility to support regional communities.

NPCA's mission is to protect and enhance America's National Park System for present and future generations. NPCA represents more than 1.6 million members and supporters with approximately 42,000 located in Washington state. Our organization has a long history of advocating for the restoration of grizzly bears to the NCE.

Restoring grizzly bears to the NCE provides significant ecological benefits that will enhance the overall health of the ecosystem. The restoration would also enhance visitor experience and bring new visitors to the region supporting gateway community economies. There are too few places where we may experience the ancient character of wildlands that include the full complement of species that evolved over thousands of years. Grizzly bears only occupy approximately 2% of their historic range. The NCE is one of the few remaining areas in the continuous U.S where it is still possible to recover and maintain a healthy grizzly bear population.

North Cascades Grizzly Restoration is Widely Supported

Grizzly bear restoration has been consistently popular with Americans. A recent survey commissioned by NPCA, and conducted online by The Harris Poll found that 85% of Americans (83% of Republicans, 89% of Democrats and 85% of Independents) support restoring grizzly bear populations back to their historic habitat in North Cascades National Park in northern Washington state.(i) These poll results track well with a 2016 Tulchin Poll that found 80 percent of registered voters in Washington support efforts to help the declining population of grizzly bears in the North Cascades recover.(ii)

This widespread support for grizzly bear restoration to NCE aligned with the comment breakdown that NPS received during the 2017 grizzly bear restoration comment period. A Freedom of Information Act request sent to NPS revealed that over 126,000 pieces of correspondence were submitted during the public comment period in 2017. Of these, 109,000 correspondences supported grizzly restoration, and only 1,300 were opposed.(iii) Approximately 15%, or about 18,900 of the comments submitted were from Washington state.

The federal agencies released a breakdown of comments received during the scoping phase of the process in 2022. Of those comments, 933 supported grizzly restoration and 285 opposed.(iv) Lastly, NPCA urges the agencies to consider all comments equally. The NPS and FWS manage our lands and natural resources for every single American no matter where they live or how they use federal lands.

Federal Law Requires Bureaus under the Department of Interior to Protect and Recover the North Cascades Grizzly Bear

The NPS and FWS are required to protect and restore grizzly bears under federal law, pursuant to both the federal Endangered Species Act (ESA) and National Park Service Organic Act.

Obligations under the Endangered Species Act

As a species designated under the ESA as “threatened” since 1975--in part because the species has been reduced to less than 2% of its former range south of Canada, according to the draft EIS--the FWS is legally obligated to protect and recover grizzly bears. Indeed, the very purpose of the ESA is “to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved [and] to provide a program for the conservation of such endangered species and threatened species,” among other purposes. 16 USC § 1531 et seq.; § 1531(b). Section 7 of the ESA mandates that federal agencies utilize existing legal authority to further the purposes of the ESA to recover listed species. 16 USC § 1536(a). Additionally, as you are also aware, Section 4(f)(1) of the ESA requires the Secretary of the Interior to “develop and implement plans [...] for the conservation and survival of endangered and threatened species [...] unless he finds that such a plan will not promote the conservation of the species.” 16 USC § 1533(f)(1).

As discussed in more length in our 2017 comments, were the FWS to select Alternative A, the “No Action” option, the agency would be neglecting its duty under the ESA to provide a program that is sufficient to allow for the conservation, based on the best available science, of a species recognized as threatened. Such an action would be in direct contravention of the plain language and spirit of the ESA, including, but not limited to, the provisions cited above.

Furthermore, failure to take action (i.e., by selecting the “No Action Alternative”) would not satisfy the purpose and need identified in the draft EIS for this federal action, and would be difficult to square with the recovery objectives articulated by the agencies to date. The purpose and need of the DEIS--avoiding the permanent loss of grizzly bears, contributing to the restoration of biodiversity of the ecosystem, enhancing the probability of long-term survival of grizzly bears, and supporting the recovery of the grizzly bear to the point where it can be removed from the federal list of threatened

species--are the very reasons NPCA and our partner organizations support restoration efforts to ensure the viability of the grizzly bear in the NCE, lands the grizzly bear roamed for over 20,000 years.

Obligations under the National Park Service Organic Act

The NPS, as a co-lead agency of this federal action, is also independently obligated to uphold the mandate of the 1916 National Park Service Organic Act, which sets forth the purpose of the Park Service as "to conserve the scenery and the natural and historic objects and the wildlife therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations." 16 U.S.C. § 1. As the record for this action makes clear--and as the expert report of Dr. Gaines (vi) further underscores--taking no additional action (i.e., through the selection of Alternative A) would be insufficient to support grizzly bear recovery in the NCE, in violation of the NPS's obligation to conserve wildlife under the Organic Act. Furthermore, as the agencies themselves recognize in the draft EIS, the NPS is additionally obligated under its Management Policies to comply with and further the purposes of the ESA and to proactively conserve listed species. See, e.g., draft EIS at 45, 244, 280; NPS Management Policies 2006, Ch. 4. In this instance, complying with this charge necessitates NPS take additional affirmative action in order to support grizzly recovery.

Washington State Law Does Not Preclude Federal Recovery Efforts

As the agencies are well aware, Washington state law(vii) does not preclude federal agencies from complying with applicable federal laws (i.e., the ESA and Organic Act). As the FWS and NPS accurately state in the draft EIS, see draft EIS at page 41, there is no conflict between state and federal laws because the Washington State code provision in question, 77.12.035, Protection of grizzly bears, that prohibits the State from transplanting or introducing grizzly bears, only applies to the Washington Department of Fish and Wildlife (WDFW), not the U.S. Fish & Wildlife Service or the U.S. National Park Service. Moreover, even if there were conflict between state and federal law, federal law would preempt conflicting state law pursuant to the U.S. Constitution's Supremacy Clause. U.S. Constitution, Article IV, Section 3, Clause 2.

Endorsement of Alternative C

If adopted, Alternative C would seek to achieve a grizzly bear restoration population goal of 200 bears within 60 to 100 years. An interagency team including FWS, NPS, and WDFW established this population goal based on the carrying capacity of the NCE. This would be accomplished by annually releasing 3 to 7 grizzly bears into the NCE over the next decade with the goal of establishing an initial population of 25 grizzly bears. Upon securing this initial population, additional bears could be transferred to support the long-term health of the population.

The NCE is already bear country, with many currently taking normal precautions to reduce conflicts with the black bear population. Under this alternative, there would be increased public outreach and education to further prepare those who live, work, and recreate in the area to minimize conflicts. NPCA believes the foundation of a successful restoration program is ongoing and proactive community engagement regarding recreating and living in and around grizzly bear country. That means professional managers on the ground educating and supporting communities, recreation users, livestock producers and other agricultural interests.

Millions currently live, work, and recreate in occupied grizzly bear habitat in Montana, Idaho, Washington, and Wyoming with minimal conflicts. Hundreds of thousands of tourists, hikers, hunters, fishermen and families recreate in the backcountry each year in occupied grizzly bear habitat without ever encountering the widespread populations of grizzly bears. The Glacier, Bob Marshall, and Yellowstone ecosystems combined have more than 2,000 grizzly bears and support more than 5 million visitors each year, yet the average number of injuries and fatalities from grizzly bears is minimal. (viii) In Yellowstone Park, between 1872 and 2018, there have been 8 people killed by bears, which averages out to one human fatality for every 26.2 million visitors. (ix)

Since 1979, there have been 118 million visitors to Yellowstone National Park. During this time, 44 people were injured by grizzly bears in the Park.(x) For all visitors combined, the chance of being injured by a grizzly bear is 1 injury for every 2.7 million visits. Breaking the risk down by the number of injuries related to the type of recreational activity visitors were involved in:

- Visitors who remain in developed areas: 1 injury in every 59.5 million visits
- Visitors who camp in roadside campgrounds: 1 injury in every 26.6 million stays
- Visitors who camp in the backcountry: 1 injury in every 1.7 million stays
- Visitors who hike in the backcountry: 1 injury in every 232,613 person travel days
- All park activities combined: 1 injury in every 2.7 million visits

Though bear attacks are rare, every incident must be taken seriously. Agencies should continue to educate communities on how to reduce human-bear conflict and recreate successfully in grizzly bear country. There are many existing outreach and education programs in Montana, Wyoming, and Idaho that have built partnerships and trust between bear managers, communities, recreationalists, livestock owners and agricultural interests.

We encourage the NPS and FWS to work with Washington state agencies to implement similar programs in the NCE. There are numerous tools, programs, and resources to reduce conflicts and support working lands. Efforts are underway to increase resources and technical support for voluntary landowner conflict prevention practices including electric fencing, livestock carcass removal, range riding, and community sanitation support. Should bears be restored to the NCE these same tools and federal funding could be deployed to minimize grizzly bear/agricultural conflict.

To increase management flexibility, this alternative proposes restoring grizzly bears to the NCE under an Endangered Species Act Section 10(j) designation. NPCA supports the proposed 10(j) population boundary, which includes most of Washington, except a portion in the northeastern corner that encompasses the established Selkirk Ecosystem Grizzly Bear Recovery Zone. The Selkirk Ecosystem Recovery Zone should remain outside of the 10(j) designation due to the current active recovery program occurring in this ecosystem.

The proposed 10(j) rule would tailor management responses in three different zones with increasing active management response when grizzlies move across different land ownership types within the recovery zone. Planning for dispersal is important and will prepare land managers for a successful long-term recovery effort.

While a grizzly bear can always be killed in the defense of human life, under a 4(d) ESA listing the parameters for when a bear can be killed or relocated for other reasons is standard across the landscape. The proposed 10(j) rule would provide more management flexibility and increase the tools the FWS and agency partners can use to address conflicts. NPCA supports designating the grizzly bears restored to the NCE portion of Washington as an experimental population under section 10(j) of the Endangered Species Act to allow both state and federal agencies a certain level of management flexibility. Zone 1 would consist of the core restoration area with the least amount of flexibility in management responses. Zone 2 would have increased flexibility for management of conflicts. Zone 3 is an area where bears would still be tolerated but would have the most responsive management.

Zone 1: The proposed management actions in this zone include: take of a bear in self-defense or defense of another person; exemption of an incidental take resulting from an otherwise lawful activity, though does not include the take of a bear that is wrongfully identified for another species while hunting; intentional non-lethal deterrence of bears to avoid conflict; and lethal removal by FWS or authorized agency partner of a bear that is involved in conflict, if a "conflict bear" determination has been made according to the interagency guidelines and it is determined to not be reasonably feasible to eliminate the threat through non-lethal means.

Zone 2: The proposed management include all the actions for Zone 1, plus the ability for federal, state, or tribal authorities to relocate a bear for a single-conflict and the ability for FWS to issue a lethal take permit to a livestock owner if a depredation has been confirmed.

Zone 3: The proposed management includes all of the actions for Zones 1 and 2, plus the ability of federal, state, or tribal authorities to relocate any bear as a preemptive action to prevent conflict or to issue a lethal take permit to a private landowner to kill a bear presenting an ongoing to human safety, livestock, or other property if there is a demonstrable and ongoing threat and when it is not reasonably possible to eliminate the threat through non-lethal means.

Recommended Modifications to the Proposed 10(j) Designation

NPCA recognizes that restoring some populations under a 10(j) designation, which allows additional management flexibility, can be a valuable tool to build acceptance in local communities to advance species conservation. Additionally, the 10(j) can be a tool to help build acceptance in local communities that may be concerned that the restoration of grizzlies could eliminate existing uses like timber harvest on public lands or access for firewood cutting or berry picking. The use of 10(j) can also enhance the potential for success in outreach and messaging about management flexibility to both assure the success of the reintroduction effort and to build public confidence that management agencies will be responsive to public needs and concerns.

We encourage the FWS to modify some components of the proposed rule to increase the potential of a 10(j) designation to ensure the successful restoration of grizzly bears and reduce unintended consequences.

Wilderness as Zone 1: Although it is unlikely that grizzlies will disperse far from the recovery zone in the near future, all designated wilderness areas that are currently in Zone 2 should be redesignated as Zone 1. The following wilderness areas should be added to Zone 1: Clearwater Wilderness, Mount Rainier Wilderness, Norse Peak Wilderness, William O. Douglas Wilderness, Goat Rocks Wilderness, Glacier View Wilderness, Tatoosh Wilderness, Mount Adams Wilderness, Indian Heaven Wilderness, Trapper Creek Wilderness. Wilderness areas are among the most protected landscapes in America. Wildlife should enjoy maximum protection in wilderness areas, where human activity is more limited. Olympic Peninsula wilderness areas can remain as Zone 3, because they are not considered to be core grizzly bear habitat.

Conditioned Lethal Take After Depredation in Zones 2 and 3: The proposed 10(j) rule includes the option for FWS to authorize a livestock owner to kill a bear that is within 100 yards of legally present livestock after a confirmed livestock depredation for two weeks. While NPCA supports responsive action to a confirmed livestock depredation, we urge the FWS to remove the provision that would issue take permits to private citizens. We also urge FWS to ensure that non-lethal take is prioritized and the lethal take of a bear in conflict occurs after all other measures have been explored. Instead, the FWS, WDFW, or a Tribal Fish and Game agency should be the party responsible for removing bears in this situation whether through lethal or nonlethal take for numerous reasons including:

- The issuance of permits to private individuals to kill conflict grizzly bears is unnecessary and not an effective way to prevent future conflicts as the wrong bear will certainly be killed in many instances. Decades of management experience in areas with grizzly bear populations have shown that agencies are able to effectively remove bears in instances of depredation. The best way to address depredation is for agency bear management professionals to capture and either relocate or remove the offending bear. If depredating bears cannot be captured and depredations continue, agency professionals can kill the bear as a last resort. Agency bear management professionals use the track size at the depredation site and bite mark size to judge if the depredating bear is an adult or a subadult or a female accompanied by young. They can use this information to maximize the probability of assuring that the correct bear is managed in any capture or removal.
- The issuance of permits to private individuals will likely result in bears being wounded as the permittees will be shooting at a bear they see in poor light or even at night with spotlights. Such wounded and dangerous bears will remain on the landscape where they will be a danger to unaware people who may be living, recreating, or working in the area.
- It could lead to the wrong bear being killed including non-conflict bears that are simply in the area. Most people cannot tell one bear from another and bears can move large distances across the landscape in a few days. Issuing a permit to a person to kill a bear that they think was involved in depredations and allowing them 2 weeks to kill any grizzly bear they think was the depredating bear will likely result in the "wrong bear" being killed or wounded. Bears are readily drawn to dead animals, and dead livestock odors or depredation remains in a pasture will draw in any other bears that might be in the area. Anyone with a permit will be likely to shoot such investigating bears even though they were not the depredating bears. The permittee will have no idea what bear committed the depredation. This is an ineffective way to solve depredation problems.
- The proposed 10(j) does not address how females accompanied by young will be treated under this permit system. If a female with cubs needs to be lethally removed following a depredation, the need to determine whether the cubs can be relocated needs to be made by a management professional. Allowing a private citizen to kill a female with cubs could lead to additional conflicts or unnecessary suffering on the part of the cubs.

Bears that depredate on livestock in Zones 2 and 3 need to be managed by either capture and relocation by agency bear

management professionals after the first offense, or removal by agency bear management professionals after the second offence. In the event of any depredations, agencies should also work with the livestock owner to secure livestock and reduce associated attractants, if possible, to reduce the probability of further depredations.

Conditioned Lethal Take Due to Threat in Zone 3: The proposed 10(j) rule includes the option for FWS, or an authorized agency to authorize a landowner or other person to kill a grizzly bear if FWS or an authorized agency determines that grizzly bears present a demonstrable and ongoing threat to human safety or lawfully present livestock, domestic animals, crops, beehives, or other property and that it is not reasonably possible to otherwise eliminate the threat by live-capturing and releasing the grizzly bear unharmed.

NPCA strongly urges the FWS to remove this provision from the proposed 10(j) rule. Along with the concerns raised above, this would allow the issuance of a lethal take permit to a private citizen based on the non-objective and vague possibility of threat. Threat not only to livestock, but also property which is not clearly defined within the proposed 10(j) but could include compost. The FWS, WDFW, or a Tribal Fish and Game agency should be the party responsible for managing bears in this situation for many of the same concerns raised above, as well as additional reasons including:

- There is no objective way to determine if a grizzly bear is “a demonstrable and ongoing threat to human safety or to lawfully present livestock, working dogs, domestic animals, crops, beehives, or other property.” Threat is an undefinable word and a threat to one person is not a threat to another.
- In over 40 years of management of hundreds of grizzly bears in the states of Montana, Idaho, and Wyoming, there has never been a need to issue permits to private individuals to kill grizzly bears like this inside or outside recovery zones. Any grizzly bears requiring a management response have either been captured and relocated or removed or taken by authorized state federal or tribal officials if it was not possible to capture such bears. This provision could create situations where people could request permits to kill bears because they feel threatened due to the species presence in the area.
- The provision also does not require that any non-lethal measures are implemented prior to a take permit being authorized.
- As noted above, most people cannot tell one bear from another and bears can move large distances across the landscape in a few days, so issuing a permit to a person to kill a bear that they think was “threatening” until “...FWS or authorized agency determines the threat is no longer ongoing...” could result in the “wrong bear” being killed or wounded.
- There is not clarity about how females accompanied by young will be treated under this permit system. Can a permittee shoot an entire family group if he/she sees them and thinks they are threatening?
If a bear is posing a threat, it should be managed by authorized agency personnel by capture or removal. We strongly suggest removal of this entire component. Such bears in any management zone should be managed by either capture and relocation by agency bear management professionals as necessary.
Successful grizzly bear restoration relies on ensuring individuals and communities have the education, resources, tools, and technical support they need to thrive alongside grizzly bears. That should include expanded signage and outreach concerning sanitation and garbage storage in all campgrounds and at trailheads into backcountry areas. We recommend prioritizing the completion of efforts to provide prevention supplies and sanitation in United States Forest Service and NPS campgrounds to enhance sanitation with bear-resistant food storage boxes at each site and bear-resistant garbage containers where necessary. Any education and outreach materials, sanitation enhancement and conflict prevention measures will also apply to and benefit resident black bears.

The restoration of grizzly bears to North Cascades National Park and the broader landscape offers a once-in-a-lifetime conservation opportunity to bring back the last major missing mammal of an incredibly wild, robust, and spectacular ecosystem. The effort would represent an enormous victory for our national parks, the people who enjoy them, and future generations that we will pass these lands onto. Agencies have a narrow window to move forward with grizzly restoration and the 10(j). If the 10(j) is adopted, future generations of people around the ecosystem will thank you for your work reintroducing a vital species to the region and giving them a full set of management tools to address, reduce, and prevent human-bear conflict. We urge you to quickly move forward with a final EIS, Record of Decision, and implementation of this important plan. We look forward to assisting you in making grizzly restoration work in the North Cascades.

Correspondence Type: Web Form

Correspondence: Natural Migration is Already Happening: Grizzly bears are already making their way into Washington. Just last week, a grizzly bear was captured and removed from Stevens County. If they're meant to be in Washington, they'll come on their own.

Safety Concerns for Recreational Users: Hikers, hunters, and outdoor enthusiasts already have to be cautious of black and grizzly bears. Introducing more grizzlies could lead to increased risks, as seen in states like Montana, Idaho, and Wyoming.

Strain on Wildlife Management: The WDFW Commission has not maximized recreational opportunities for sportsmen as

directed in their mandate. With recent decisions on black bear and potential changes to mountain lion hunting, many conservationists fear the commission is failing to manage its wildlife properly. Introducing more grizzlies would exacerbate this issue. To be clear, reintroduction would not mean a grizzly bear hunting season. The point here is that the state is already under strain from mismanagement of its large population of existing predators beside grizzly bear.

Predator Balance is Essential: Washington is already home to a variety of predators including wolves, cougars, black bears, and coyotes. Washinton's ungulate populations, such as elk, deer, moose, mountain goats, and the endangered woodland caribou, are under strain. Introducing more apex predators would further imbalance its delicate ecosystem. Again, much of this is a consequence of decisions made within the state to properly manage existing species.

If Grizzly bears are restored in Washington, the WDFW commission must allow hunters to have a part in managing them through allocation of tags that are based off of science and biology. This also needs to be applied to other species of predators such as black bears and mountain lions(including allowing the use of hounds to hunt and properly manage the mountain lion population).

Correspondence: Grizzlies belong in the North Cascades. They are natural predators, who are an important part of the great circle of life. They need to be there, just like wolves, deer, and all the other creatures who make up the mountain ecosystem. We must learn to leave nature alone to take care of itself. When we try to intervene, we only succeed in mucking things up. The bears and wolves belong. If anything doesn't belong, it's us!

Correspondence: This is not a good idea, I believe this has been proven with the wolf reintroduction. Their has been nothing but problems with ranchers/cattle and had a detrimental effect on prey species. This coupled with removing the hunting of preparatory cats without the aid of well trained dogs has been a very disheartening few decades of largely decreasing deer/elk populations to say the least Additional predators such as grizzlies will only further the process of reducing all prey animals and eventually cause more human/predator conflicts, while inevitably costing the state thousands in revenue due to declined hunting license purchases because of reduced deer/elk populations available to be harvested.

Correspondence: Dear National Park Service & To whom it may concern,

I support the reintroduction of grizzly bears to the North Cascades range where they thrived thousands of years before humans decimated them or pushed them out of this territory. They belong in and contributed in many ways to that ecosystem and would do so again. My understanding is that the few grizzly bears brought into the territory would be placed in remote areas not close to human populations, thus should not create unwanted dangers for people.

I am writing to ask that you support the restoration of grizzly bears to the North Cascades Ecosystem, their historic range for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C but with needed changes to the proposed 10(j) rule. The proposal would bring up to 25 non-conflict grizzly bears - likely from Montana - into remote areas of the North Cascades over the next decade and manage them as an experimental population.

The proposed 10(j) rule as currently written fails to give grizzlies the best chance to succeed and is too permissible in allowing reintroduced bears to be killed.

Lethal removal of a grizzly bear should only be considered where there is a demonstrable threat to human safety, and, for non-immediate threats to human safety, only after non-lethal management options, including concerted use of conflict prevention methods, have been exhausted.

No grizzly bears should be hazed or relocated as a result of conflict with livestock unless demonstrable, repeated efforts have been made by the livestock producer to prevent such conflicts, using commonly-available techniques.

No grizzly bears should be killed on public lands as a result of livestock depredation.

Landowners/private citizens should not be given a permit, or otherwise authorized, to kill a grizzly bear.

No grizzly bear should be preemptively relocated if the bear is not a threat to human safety, particularly if the bear has not become habituated or food-conditioned, or when nonnatural foods/attractants have not been properly secured and made inaccessible to bears. Doing so acts as a disincentive for communities to employ conflict prevention measures, and increases the risk to the bear of injury or death from capture and relocation.

These changes are crucial in providing adequate protection for grizzly bears.

I also support an education campaign and postings in the appropriate areas so that people are aware of what they should or should not do when out in remote areas. And education, as well should be given to ranchers or farmers that are concerned about livestock. The more people know, the more fears can be dispelled.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in

the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C and with appropriate changes to Section 10(j). Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thanks for the opportunity to comment.

Correspondence: Recommend Alternative 'A' NO-ACTION PLAN.

The EIS is silent on too many facts that dispute the effectiveness of the two Action Plans. Clearly the EIS is highly leveraged by special interests and the use of reports that go back nearly 60 years.

In 2016 the federal government's point man for 35 years on grizzly bear recovery was quoted as saying "there are now about 2,000 grizzlies in the Lower 48 AND "the Yellowstone and Northern Continental Divide Ecosystem populations ARE RECOVERED."

That was back in 2016. So here we are 7 long years later - Montana, Wyoming, Idaho all petitioned for delisting the Grizzly. They were ignored, or their filings were dismissed.

The government talks about restoration of 200 bears - supporting up to 35 grizzlies during first 5 years. Annual grizzly offspring would then likely put the Grizzly population at over 50. Yes, that will take some years. But it takes only ONE Grizzly to ruin your day. And you have to be alert, on guard every day whether you're hiking, biking, working cows, horses, irrigating, walking your pet, any outside activity. You have to be lucky every time. A Grizzly only needs to be lucky ONE TIME.

The Grizzly recovery plans that are currently in force have not been updated or otherwise adjusted to accommodate the changes in bear population, livestock depredation, or the increase in Grizzly attacks on humans. The federal government should not force apex predators into our communities until after they've corrected mistakes of the past, especially those mistakes that have cost human lives.

Office of the Superintendent
North Cascades National Park Complex
Grizzly Restoration EIS
810 State Route 20,
Sedro-Woolley, WA 98284

Dear Superintendent Striker,

RE: Support for grizzly bear recovery in the North Cascades ecosystem

The Skagit Environmental Endowment Commission (SEEC) was established under an agreement between the Province of British Columbia and the City of Seattle as a condition within the Ross Lake/Seven Mile Reservoir Treaty between the United States and Canada signed in 1984 (Appendix D). The treaty and agreement are in effect until 2064.

SEEC's mission is to ensure the preservation and protection of the natural and cultural resources and recreational opportunities of the Upper Skagit Watershed to the highest North American management standards through advocacy, promoting international collaboration and strategic partnerships and investments. As a transboundary entity, SEEC values this opportunity to protect and recover species like the grizzly bear, which still is found in the BC side of this shared ecosystem, and has supported public education and research towards this goal in Canada, as well.

SEEC has supported public education and research on grizzly bear restoration during the initial scoping process in preparation for the draft environmental impact statement (EIS). SEEC committed to providing up to \$250,000 toward the EIS process and approved the use of these funds to support population modeling and public agency involvement.

We have been pleased with the integrity of the science and the extraordinary commitment from the National Park Service and other cooperating agencies, including the Washington Department and Fish and Wildlife, to engage and educate the public around this issue and process.

As an entity with a transboundary focus and mission, SEEC appreciates the international coordination conducted already through the North Cascades Subcommittee of the Interagency Grizzly Bear Committee, and we hope it continues through this analysis to implementation of recovery actions. We also appreciate the actions underway by the NPS to install wildlife-proof food storage containers throughout the Ross Lake National Recreation Area.

SEEC strongly supports action to recover a long-term viable population of grizzly bears in the North Cascades because they are a key component of this ecosystem and cultural landscape.

We also support the designation of this grizzly bear population as an experimental/nonessential population pursuant to Section 10(j) of the Endangered Species Act. We believe this Section 10(j) designation will allow the greatest flexibility in management for grizzlies on the United States side of the North Cascades, and therefore offers the best opportunity for minimizing potential conflicts in the interest of both wildlife and people who visit or live in the region.

These comments will supplement those provided by SEEC in March of 2017 to the Draft Grizzly Bear Restoration Plan Environmental Impact Statement for the North Cascades Ecosystem issued in January, 2017.

Thank you and other state and federal agency partners and cooperators for this opportunity to support the recovery of this keystone species to one of the remaining wild and largely intact ecosystems in the contiguous United States which is shared with Canada.

Sincerely,

██████████
USA Co-chair, SEEC

Correspondence: Speaking as someone who recreates in the North Cascades weekly, hiking, climbing, and backcountry skiing, I whole heartedly support efforts to reestablish grizzly bears in the North Cascades. Having spent a fair bit of time in areas with healthy grizzly/brown bear populations (Alaska, Montana, Wyoming, Alaska, BC, Alberta), I am familiar with the extra precautions required and risk incurred, but find that the sense of wonder and joy at having the opportunity to see these magnificent animals in the wild far exceeds the downsides.

From a broader perspective, we are living in a time were it feels as though the biosphere is in a constant state of retreat. Factors including global warming, habitat loss, and over hunting are causing species extinctions and a dramatic decay in biodiversity. In this context, we must make use of all available opportunities to reverse the tide. This is an important chance to restore biodiversity to our region, and I believe it is imperative that we act.

I support either Alternative B or C from the draft EIS. Grizzly bear populations in the North Cascades Ecoregion should be restored.

Correspondence: I support the careful and considerate reintroduction of Grizzlies into the North Cascades Ecosystem. I know me the hardest challenge will be the public perception of Grizzlies as dangerous animals and the possibility of encountering these animals in the wilderness areas that are very popular to human recreation. As an avid trail runner, I know how this will impact my community but I think it provides a valuable lesson if communicated properly about how these places are not just for human consumption and that we need to recognize the benefit of this decision to the vitality of the entire region. Public outreach will be extremely important. Continued funding for professionals who desire to connect people to conservation efforts should be a priority alongside reintroduction programs otherwise such programs will fail. Implementing the latest research on community engagement and allocating the appropriate resources should be at the forefront of everyone's efforts involved.

Correspondence: I am now approaching 70 years old, and grew up loving to hike in the Cascades of Western Washington. For the last several years now I do not go much because so many trails are overcrowded, trail entrance areas are overparked and folks are then parking on highway shoulders. In addition, there is far less respect for the wildlife and leaving trash and feces on the trails instead of packing it out. Since my 'growing up years', the development and population of Western Washington has skyrocketed, meaning more and more people out on trails, especially on weekends. In Western Washington, many areas have fairly easy access for 'city folks' on a weekend jaunt. I feel that introducing Grizzlies to this largely human-populated (often ill-behaved humans) is dangerous!!

Having lived 7 years in Montana, with Grizzlies still in residence, it was okay to go hiking with due caution of course. There was less population by humans near the wilderness areas, and the folks there pretty much abided by respect of the bears and consciousness of the dangers of risky behaviors. Even then, there were still occasional deadly attacks!

The population in Western Washington has exploded, and this population would not give due caution and respect to the presence of Grizzly Bears, endangering both bears and humans.

Correspondence: Grizzly bears deserve the right to stay in the habitats that they have currently adapted to without being removed. Reintroducing them to a new area is unhealthy for their adjust and will increase violent reactions to the influx of human interactions they will experience. People here are not used to the presence of these animal and a strained relation between them and us will be inevitable. The hiking and recreational lands we have available to us have recently been increasingly inhibited by predatory animal sightings and interactions and this will only increase with the presence of another deadly species. We, Washington state, pride ourselves on providing endless outdoor recreation to the families and communities that make us who we are. We do not want yet another obstacle to interfere with ours desires to do so in a safe and comfortable manner.

Correspondence: Typed and emailed for Elaine Engles Sears by Theresa Ferron (Daughter-in-law)

To: Department of Fish and Wildlife
Attn: Brad Thompson, State Supervisor

Dear Mr. Thompson:

My name is Elaine Engles Sears. I am 81 years old and I live at the base of Whitehorse mountain. I am writing to ask you respectfully not to place grizzlies in the North Cascade mountain range. Considering the new population growth and interest in these rural areas and the high volume of hikers in these mountains, I believe that to inject these bears into this area would be a disastrous mistake.

For more than a decade I resided in both Alaska and Montana, so I know more than I would like to about the grizzly -- "ursus arctos horribilis".

I know the grizzly is a major killer. It will and does kill and eat humans, burying anything left uneaten, and returning later to dig up and finish the remains.

I also know the grizzly is not content to wander solely in the highlands. It loves the valleys - the flatlands - and gets to them in a hurry where it then fishes the salmon out of the creeks, gorges on fruit, destroying the trees, kills livestock, snags domestic animals, and easily claws its way into any wood structure about which it is curious. I know you realize all of this,. The truth is any child walking to school or to the school bus in the early morning hours would be in mortal danger from this animal.

At the moment there is a great run -- a race, in fact -- to "save the environment" and "restore the balance of nature". I'm not saying that is wrong. I was raised by a long-time forest ranger who served the Mount Baker Snoqualmie area for 30 years, so I love these hills and the animals who inhabit them; but I also love my family and my neighbors. Common sense must prevail. Wildlife enthusiasts get excited and begin to push personal agendas. There can be a lot of hubris when one believes he/she is saving the world. Please don't allow hubris a seat at the table when the final decision is made.

Thank you --

Correspondence: To the Members of the U.S. Department of the Interior, the U.S. Fish and Wildlife Service, and the National Park Service,

Thank you for accepting comments on this document. There are multiple points I would like to address, the cumulative sum of which directs me to recommend AGAINST the proposed course of action. These points are listed below:

- 1) Disruption to currently established ecosystems which have adjusted to a new equilibrium post-disappearance of grizzly populations, including competition with native black bears
- 2) Conflict between introduced grizzlies and human populations that have become equilibrated to a reality post-disappearance of grizzly populations, including damages to livestock and property
- 3) Unfavorable public opinion of grizzly populations due to the aforementioned conflict, especially in rural communities, resulting in reduced support for conservation efforts
- 4) Undue stress and risk to transplanted grizzlies
- 5) Imminent natural migration of grizzly populations from Canada into the North Cascades
- 6) Allocation of resources that could be directed to protecting and expanding the current populations of grizzlies outside of the Cascades
- 7) Allocation of resources that could be directed to conservation efforts of neglected and at-risk species including fish, amphibians, and microfauna which are critical to ecological health
- 8) Allocation of resources that could be directed to environment restoration projects that are currently yielding successful results, such as the restoration of the Dungeness River Watershed
- 9) Allocation of resources that could be directed to maintenance of national and state parks which are in need of funding, staffing, and refurbishment

I believe that the skills and resources of your departments would serve the wild places of our country in far more impactful ways than by pursuing the proposed grizzly restoration plan. Please continue the powerful work you do in promoting education, conservation, and management of the parks so critical to humans and wildlife alike. Thank you for your time and consideration.

Correspondence: I agree completely with the North Cascades Conservation Council's comments. They are very well researched, well reasoned, and fair in all aspects. I quote:

"Dear National Park Service and Fish and Wildlife Service:

North Cascades Conservation Council offers these comments on the Draft Environmental Impact Statement (DEIS) for the reintroduction of grizzly bears to the North Cascades Ecosystem. Our enthusiastic support for the return of grizzly bears to the Ecosystem is tempered by our concerns over the process proposed to reintroduce bears, and the management of bears post-placement.

The first principle for successful reintroduction of grizzlies is to do no harm to existing bear populations or to wilderness, and to safeguard reintroduced bears. The reintroduction plans contemplated in the DEIS Alternative C appears poised to violate this principle. We cannot support any reintroduction plan that involves intensive use of helicopters in wilderness, and the haphazard killing of reintroduced bears under vague pretenses. The way to get grizzlies flourishing in the North Cascades is to protect wilderness, not desecrate it while killing bears. Therefore, we support implementation of Alternative B.

Reintroduction Targets

We are generally supportive of the target of a local population of 200 bears over the long-term. We generally agree with the process of introducing a small group of bears each year over a period of five to ten years. However, we feel that an initial population of 25 bears may be insufficient to obtain the 200 bear objective when considering the limited breeding stock, limited potential for interbreeding with outlying grizzly populations, and the proposal for lethal means of managing bears. We would favor a firm commitment to reintroduce a minimum of five bears per year over an eight-to-ten-year window.

Reintroduction Process

The EIS should include a review of all previous grizzly reintroductions anywhere in North America to determine the level of, and reasons for mortality that occurred both during the transport of bears, and due to the unsuccessful adaptation of bears within the first 3-6 months post-reintroduction. Every effort should be made to avoid repeating past mistakes, and to reduce, if possible, the shock to bears of being drugged, transported, and placed in an unfamiliar location. The EIS should identify whether and to what degree causes of mortality can be avoided, and whether on balance any given reintroduction plan's value outweighs the deaths of bears it will cause.

Sources from which to Glean Grizzlies

While we recognize that travel distance is a factor in ensuring the safe relocation of grizzlies into the North Cascades, we believe bears should only be gleaned from places where the existing population is stable and flourishing, and would be expected to remain intact even after removal of some bears. We are not presently comfortable with removing bears from anywhere in the lower 48 United States.

Furthermore, bears should not be gleaned from populations whose primary food source differs from the available food sources in the North Cascades. For example, it would seem unwise to reintroduce bears that have adapted to coastal food sources.

Public Education Program

A grizzly recovery effort should be accompanied by a more intensive public education campaign than is proposed. It should of course involve both federal and state government, focusing on communities and popular recreation sites surrounding, and within Zones 1 and 2 to minimize potentially dangerous encounters between grizzlies and humans.

An intensive information campaign would involve how to identify grizzly bears; how to avoid areas where grizzlies are likely to be present at specific times of the year; what to do if encountering a grizzly; how to bear-proof campsites and residences; a requirement to carry bear spray in the backcountry; what brands and/or intensities of bear spray to carry and how to use it; the value of noisemaking devices to scare off bears.

The State of Washington should educate hunters (bear hunters or pursuers of other game animals) on how to distinguish a grizzly from a black bear. Killing a grizzly bear for any reason other than justifiable self-defense should be met with legal consequences under the Endangered Species Act to be enforced by the respective federal and state agencies.

10(j) Designation Under the Endangered Species Act

We are including our position on the designation of the North Cascades grizzlies as an experimental population under Section 10(j) of the ESA in these comments, as this issue is directly related to the overall goal of establishing grizzlies in the North Cascades. This is not a separate issue. It isn't clear why two separate sets of comments are required when the 10(j) rule is proposed in one of the action alternatives (C) and not in the other (Alternative B).

If the objective of establishing a breeding population of grizzlies in the North Cascades, and in suitable habitat outside the Ecosystem (outside of Zone 1) is to be realized, half-measures will not suffice. Assessment of whether the existence of grizzlies is compatible with present land uses and activities has already been made with the decision to pursue reintroduction.

Such determination should consider the fact that grizzlies were extirpated from their traditional range in the Ecosystem due to perceived land use conflicts. Humans killed all grizzly bears in the North Cascades rather than adapting land uses to the

ecological necessity of top-tier predators across the landscape. This reverse-logic process should not be repeated.

In consideration of the three management zones, management direction for Zone 2 should not differ from Zone 1. In Zone 3, killing of bears should be limited to cases where a person is in imminent danger of being harmed or killed by a grizzly. It should be an accepted principle that grizzly bears will self-restrict to preferred habitat in wild places where conflicts with humans other than recreation users would be unlikely.

We oppose 10(j) designation for North Cascades grizzlies and instead encourage the implementation of public education measures that reduce human/bear conflicts and preclude the perceived need for lethal means of managing bears, as described further in these comments. Alternative B satisfies most of these concerns. The purpose of reintroduction of grizzlies is to amend the mistakes of the past, so why compromise that principle? The alleged need for a 10(j) designation has been described as a "...larger tool box." When the main tool in the box is a high-powered rifle, the designation is contrary to the purposes of the project.

Human Use Issues

Management of bears that may pose threats to livestock should be more detailed. There should be a distinction between grizzlies threatening livestock on public land open range versus contained livestock on private land. Lethal force should never be used to protect open range livestock: federal land should be considered bear territory. The standard for addressing bear interactions with livestock on private land should stipulate that bears may only be disturbed if they directly threaten livestock (attacking animals) rather than merely their presence in areas where livestock are present.

The first option to address bears that directly threaten contained livestock should be relocation, not killing. The option of supplying ranchers in the wildland urban interface with rifles that discharge tranquilizer darts whereby bears would be disabled to await relocation by federal officials, is preferable to deadly force at the discretion of the livestock operator. In the relocation effort, every bear should be considered an integral part of ecosystem restoration rather than an expendable resource.

We are also concerned that logging operations are listed under direct threats to human uses. We fail to see the need to have any distinction between bears interacting with recreationists in backcountry than with personnel on logging operations. This directive implies that logging companies may arbitrarily kill bears that are in the general vicinity of a logging operation.

Helicopters in Designated Wilderness

We implore the Park Service and FWS to explore and analyze options to the use of helicopters in designated wilderness, and in roadless areas. Based on available information and common sense, we believe the use of helicopters in designated wilderness for reintroduction of grizzlies is not a necessity but an unnecessary convenience in violation of the Wilderness Act. No exceptions to the Wilderness Act should be pursued. There are several locations where bears could be successfully placed with wide geographic coverage using ground-based vehicles on existing, open roads, and/or using helicopters without landing in designated wilderness.

Exceptions to the Wilderness Act should be limited to emergency situations where human life is at stake, not the contradictory objective of facilitating the reintroduction of native species that depend on wilderness for survival.

We have identified several locations outside areas of human presence where reintroduction can occur on existing roads with no helicopter use: Slate Peak near Hart's Pass; roads end on the upper Twisp River Road; the end of Eightmile Creek Road south of the Pasayten Wilderness; the road along the Chiwawa River near Trinity; the end of the road at Cascade Pass, the end of Road 11 above Shannon Lake.

Helicopter reintroductions could occur outside of designated wilderness in, but not limited to, the following locations: Golden Horn in the upper Methow Watershed; Burch Mountain at the headwaters of Eightmile Creek; Foggy Pass on upper Canyon Creek; Lamont Lake at the headwaters of Cedar Creek; Easy Pass; Cub Lake at Prince Creek; Evergreen Mountain near Beckler River; Indigo Lake in the Suiattle River Watershed.

All the above locations would allow a wide distribution of grizzlies throughout Zone 1 without using helicopters in designated wilderness, or at all. However deep into backcountry bears are placed, released bears will presumably remain in backcountry, and migrate to the habitats necessary for their survival.

In addition, for management of bears post-release, access to bears in designated wilderness should be by foot or pack animals only--no continued use of helicopters for ground examination should be permitted. The EIS should state more succinctly what human intervention would be deemed necessary (not just "desirable") for bear survival after bears have been released.

Connecting Island Populations

As you know, the 10(j) rule considers a reintroduced species that is geographically isolated from other occupied habitats as experimental. This begs for a solution to creating populations that will remain isolated. Although it may seem outside the scope of the EIS analysis, we highly recommend there be disclosure in the EIS of measures that can be taken in specific areas to facilitate connectivity between grizzly bear populations in the United States and Canada in the future.

Connectivity is essential to facilitate inter-population migration to diversify the grizzly gene pool. Such analysis would include identification of areas where habitat restoration could occur on public land between the North Cascades and federal land in the Idaho panhandle and northwestern Montana, and populations in south and central British Columbia.

The EIS should disclose what measures would be needed in the respective areas for example, road closures and other means of habitat restoration. This consideration would set the stage for the overarching objective of expanding habitat to restore grizzlies to areas of historical existence outside island populations by creating seamless habitat.

This concludes our comments. It is refreshing to comment on a federal proposal that would restore the natural world. We are grateful for the time and effort the National Park Service and Fish and Wildlife Service have invested in the effort to restore native grizzlies to their former habitats."

Thanks for your careful consideration of this important issue.

Correspondence: I strongly disagree with reintroducing grizzly bears in the North Cascades. There are too many hikers and campers that utilize that area for recreation. Grizzly bears and humans don't get along particularly well, and there will be encounters between the two, most likely resulting in injuries or death to one or the other. While I certainly do not wish injury to my fellow outdoor enthusiasts, I also do not wish harm to come to these magnificent creatures.

To whom it may concern,

I am writing to support the restoration of grizzly bears to the North Cascades Ecosystem, their historic range for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C but with needed changes to the proposed 10(j) rule. The proposal would bring up to 25 non-conflict grizzly bears - likely from Montana - into remote areas of the North Cascades over the next decade and manage them as an experimental population.

The proposed 10(j) rule as currently written fails to give grizzlies the best chance to succeed and is too permissible in allowing reintroduced bears to be killed.

- Lethal removal of a grizzly bear should only be considered where there is a demonstrable threat to human safety, and, for non-immediate threats to human safety, only after non-lethal management options, including concerted use of conflict prevention methods, have been exhausted.
- No grizzly bears should be hazed or relocated as a result of conflict with livestock unless demonstrable, repeated efforts have been made by the livestock producer to prevent such conflicts, using commonly-available techniques.
- No grizzly bears should be killed on public lands as a result of livestock depredation.
- Landowners/private citizens should not be given a permit, or otherwise authorized, to kill a grizzly bear.
- No grizzly bear should be preemptively relocated if the bear is not a threat to human safety, particularly if the bear has not become habituated or food-conditioned, or when nonnatural foods/attractants have not been properly secured and made inaccessible to bears. Doing so acts as a disincentive for communities to employ conflict prevention measures, and increases the risk to the bear of injury or death from capture and relocation.

These changes are crucial in providing adequate protection for grizzly bears.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C and with appropriate changes to Section 10(j). Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you for this opportunity to comment. I will continue to follow this process and am hopeful of a positive outcome for grizzly bears.

Correspondence: As a wildlife photographer who frequently encounters grizzly bears in the Yellowstone ecosystem, I have seen first hand the effect that they have on bringing natural balance to their home range. Grizzly bears have historically belonged in the north cascades, and their absence is one of the great ecological tragedies of our time. The threat to recreational use of the park is insignificant compared to the positive effect that bringing these bears back will mean. All citizens of our state should support this plan and help to bring these amazing animals back.

Correspondence: For the following reasons, I am opposed to reintroducing grizzly bears to the North Cascades. I am a lover of nature and believe in conservation, but reintroducing predatory species that have been absent for some time can have unforeseen negative effects. There will be more competition for resources with the established native species that still exist in the areas, and it is difficult to predict if grizzlies or black bears will be pushed closer to areas highly populated by humans to look for resources. I think our time and resources would be best put to use to conserve our current fauna and flora, and to keep access to our beautiful parks maintained so we can all enjoy and experience our lands as responsible stewards.

Reintroducing a predatory species in our north cascades will likely lead to unfavorable encounters with hikers and those exploring our parks. While many avid adventurers may know how to encounter a bear in the wild, there are many visitors and less experienced people that may not be able to correctly read the body language of a bear or how to act in a potentially dangerous situation. Anyone who has hiked in the North Cascades can probably understand how quickly the wind could render bear spray completely useless if it came to that desperate of a situation.

I understand wanting to restore a species, but we should focus on our current local restorations rather than uprooting these animals from their current home and reintroducing a species that has been absent for many years. Thank you for giving us the opportunity to provide input.

Re: Endangered and Threatened Wildlife and Plants; Establishment of a Nonessential Experimental Population of Grizzly Bear in the North Cascades Ecosystem, Washington State

Via: Electronic Submission; U.S. Fish and Wildlife Service, Docket No. FWS-R1-ES-2023-0074. Federal Register 9/29/2023

Dear Director Williams et al.

The Washington Farm Bureau (WFB) is the state's largest voluntary grassroots agricultural advocacy organization representing the social and economic interests of farm and ranch families, including private forest landowners, at the local, state, and national levels. We respectfully request consideration of the below recommendations and analysis on behalf of our members.

WFB has significant concerns over the Draft Environmental Impact Study (DEIS) released by U.S. Fish and Wildlife Service (USFWS) related to the nonessential experimental population (NEP) of the grizzly bear in the North Cascades Ecosystem (NCE). Our strong opposition to any introduction of grizzly bears is rooted in the danger grizzlies will pose to our members, their employees and their families in the area. At this time, WFB is supportive of Alternative A as stated in the DEIS for multiple socioeconomic, regulatory and immeasurable reasons; the preference of our members is no introduction of grizzlies. USFWS proposal to introduce a NEP and establish grizzlies in the NCE is not a necessary step for conserving the species. Our members have managed sheep and cattle production for generations across tens of thousands of acres of public and private lands throughout Washington. These producers are the conservationists of these landscapes, having managed lands, waters, wildlife, and adverse conditions with the most accurate record keeping in history to ensure the resources remain healthy and resilient. These producers have always been partners with public landowners and contribute significantly to the wellbeing of federal and state lands. Yet, agencies continue to push interests and farmers continue to present issues on this same topic through three presidential administrations.

Ranchers, who have been in the area for generations, are worried that reintroducing bears will reach the same end as wolves and the lack of management from several agencies will perpetuate predation on cattle throughout the area. The DEIS fails to clearly state how the NEP of grizzlies introduced to the NCE will help to effectively lead to the delisting of the species. Just as the recovery for wolves is a moving goal post of population and nonlethal deterrents, the recovery for bears poses similar threats and tie the hands of the stewards producing food in the area.

As bears seek food and disperse away from Management Zone 1, predations will increase and livestock will respond negatively in several ways. Stress on livestock can greatly impact growth and fertility causing irregularity in a herd and reducing the efficiency of both the animals and manager. One 2014 study focused on wolves but noted the results can be more broadly applicable to other predators: in areas near a confirmed kill livestock weights were down 3.5 percent.¹

Additionally, a different study

¹ "Crying Wolf? A Spatial Analysis of Wolf Location and Depredations on Calf Weight," American Journal of Agricultural Economics. 10/2014.

found 19 percent of ranchers reported reductions in conception rates.

² An external negative impact to a manager's return on investment reflects the industry's viability; especially when livestock producers and farmers are dependent on a commodity market and incapable of setting their own prices.

Not only will the grizzly bear as an apex predator pose a threat to cattle, livestock and local ungulates, but it will significantly impact the families and employees managing land and services in the NCE and private lands most adjacent to the NCE border.³ Regardless of commodity, employers and employees alike are not interested in working in the presence of a grizzly bear. Farmers are obligated to provide a safe work environment for their employees and are continually complying with state and federal safety standards and laws. Unknowingly subjecting employees to a dangerous hazard like a grizzly bear in an orchard block or riparian area while tending cattle will raise questions about the liability of an attack, particularly if an attack happens on private land. This type of threat and continued occupation of grizzlies will lead to unharvested orchard blocks, ungrazed sections of land and reduced wages for employees.

Pollinators will also face pressure when trying to achieve what all farmers, landowners and natural resource managers need in the spring and summer. Without the increased populations of pollinators during the spring and summer from the presence of pollinating businesses and backyard beekeeping, natural landscapes and orchards and other crops will suffer. Every year beekeepers struggle to keep hives confined and well managed surrounding them with electric fence, ribbons and other deterrents, yet bears do not mind and continue to destroy both hives and colonies.

The establishment of grizzly bears in the NCE with the NEP under the 10(j) rule does not provide the flexibility required for an agricultural producer to properly respond and manage their farm and livestock. If lethal take of a bear in Management Zone 2 can only be done after confirmed depredation has already occurred, or if lethal take can only be done in Management Zone 3 after the Service determines that a bear presents a "demonstrable and ongoing threat to human safety or to lawfully present livestock," there will be an inevitable harm to producers.⁴ If the intention of USFWS is to establish grizzly bears and protect agricultural producers, landowners and the greater human population, the tools available must be expanded and require more stringent definitions.

Despite the best of intentions by USFWS or other agency staff, depredation kills can be misidentified and responsiveness to a depredation can lack the urgency the producer needs to stifle the further issues. We request clarification on USFWS reasoning on p.58 of the proposed 10(j) rule, "Once (USFWS) or authorized agency determines the threat is no longer ongoing, the authorizing agency will notify the person, terminating the authorization." Producers need a clear, consistent threshold of what constitutes a no-longer ongoing threat. The process to request and receive written authorization to engage in lethal take must be a streamlined process and Farm Bureau is ready to foster the relationships required to assist both USFWS and producers in resolving potential grizzly bear conflicts. Many producers already experience lengthy bureaucratic delays to everything from review of minor range improvements to

2 "Modeling Large Carnivore and Ranch Attribute Effects on Livestock Predation and Nonlethal Losses," Rangeland and Ecology Management. 6/2018.

3 Proposed Rule, Docket No. FWS-R1-ES-2023-0074. Federal Register 9/29/2023.

4 Proposed Rule, Docket No. FWS-R1-ES-2023-0074. Federal Register 9/29/2023.

renewal of grazing permits. Time is of the essence when responding to depredation threats; the authorization of producers to lethally take a grizzly bear is especially crucial to prevent the next attack.

Agricultural producers also deserve transparency and timeliness of information within the NCE and Management Zones 2 and 3. To keep producers and the public safe, notifying people in the area of a grizzly bear especially in a situation where human life may be jeopardized is crucial. Collaring every bear upon capture and relocation would provide the tools to USFWS staff and the public to help prevent further depredations or threat to public safety. Collaring bears and having an active tracking system would give producers the ability to safely send employees into orchards and grazing areas and a tracking system would give peace of mind to those who want to utilize federal lands for recreating. Notification on release sites and dates, and updates on the movement of collared bears, must be shared with producers. After a lethal take incident, the circle of information sharing must go beyond the recovery coordinator and Washington Department of Fish and Wildlife; it must also include the USFS staff located in the NCE area.

The proposed reintroduction of grizzly bears will negatively impact livestock and tree fruit producers while simultaneously forcing families to move and shift communities away from agriculture-based economies in rural areas. Our members in Washington continually provide safe and abundant food to communities while also maintaining soil health, diverse habitat and fire suppression through grazing. Introducing grizzlies to Washington, a state already saturated with apex predators, will increase the stress on employers and employees, threatening the viability of agriculture and disproportionately affecting farmers and ranchers. We urge you to put this rule down and not introduce grizzlies to the NCE or the state of Washington. Thank you in advance for your consideration of our comments.

Sincerely,

/s/

Governmental Affairs Coordinator

Correspondence: I am writing to support the restoration of a healthy population of grizzly bears to the North Cascades, their home for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C: Restoration with Section 10(j) Designation. The proposal would bring up to 25 non-problem grizzly bears into remote areas of the North Cascades over the next decade and manage them as an experimental population.

Alternative C is the best choice for bears and the people who live and visit the North Cascades Ecosystem. The 10(j) rule will give people more management tools to reduce, prevent, and sometimes respond to human-bear conflict. I believe that the 10(j) rule, if properly implemented, will help increase human acceptance of grizzly bears as they return to the landscape.

Grizzly bears are ecologically and culturally significant and are vital to the overall health of the North Cascades ecosystem and its biodiversity. Please bring back this native species to our state through the strategy laid out in Alternative C. Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Re: 2023 North Cascades Ecosystem Grizzly Bear Reintroduction Plan Draft Environmental Impact Statement

Dear Superintendent Striker,

Thank you for the opportunity to submit scoping comments on the North Cascades Grizzly Bear Restoration Plan and Draft Environmental Impact Statement (DEIS). Please accept these comments on behalf of Western Watersheds Project (WWP) and Erik Molvar.

WWP works to protect and conserve the public lands, wildlife, and natural resources of the American West through education, public policy initiatives, and litigation. WWP staff and members use and enjoy the public lands in Washington, and its wildlife, cultural, and natural resources for

health, recreational, scientific, spiritual, educational, aesthetic, and other purposes. This includes those public lands in the North Cascades Ecosystem (NCE) where the proposed grizzly bear reintroduction project will take place.

We are pleased to see that with the release of the DEIS the National Park Service (NPS) and the U.S. Fish and Wildlife Service (USFWS) have taken another important step in a process that will ensure grizzly bear reintroduction in the NCE. Despite having some significant concerns with major components of the DEIS analysis and proposed plan (comments below), WWP is generally heartened to see such a meaningful step being taken after many years of delays and false starts.

1). Livestock Grazing:

In previous scoping comments submitted jointly in December 2022 by WWP and WildEarth Guardians (WEG)¹, several concerns related to livestock grazing, including impacts to grizzly bears and the need for robust interagency coordination were raised. Suggestions were made to address these concerns through further analysis and proactive planning that involved other federal agencies (esp. the USFS). Unfortunately, it appears that NPS either chose to disregard these suggestions, or did not adequately address them in the DEIS.

Impacts of Livestock Grazing on Grizzly Bears:

Despite previous comments highlighting the need for NPS to analyze the impacts on grizzly bears resulting from livestock grazing on federal grazing allotments within and adjacent to the NCE, there was little to no substantive attempt in the DEIS to do so. This is despite there being clear evidence in other grizzly bear recovery areas of how the presence of livestock within and adjacent to recovery zones can negatively impact mortality rates.

Footnote 1: WWP and WEG's previous scoping comments on this project are hereby incorporated in their entirety into the comments offered here, as they are still relevant and apply fully to the issue at hand.

In 2020, the Yellowstone Ecosystem Subcommittee's Technical Team produced a report detailing the leading causes of mortality for grizzly bears within the Greater Yellowstone Ecosystem (GYE).² This report found that "outside the Recovery Zone (RZ) but within the Demographic Monitoring Area (DMA), mortalities from livestock conflicts and self-defense kills are the primary sources of documented mortalities. Outside the DMA, livestock and site conflicts are the primary sources of mortalities." From 1999-2008, there was an average of one grizzly bear killed per year due to livestock depredations outside the RZ and inside the DMA, with 0.3 grizzlies killed per year outside of the DMA following conflicts with livestock. This increased significantly and between 2009-2018, there was an average of 5.4 grizzly bears killed per year due to livestock depredations outside of the RZ and inside of the DMA with 3.1 per year outside of the DMA. These mortality levels are significant and clearly show that livestock presence in or near recovery areas have the potential to negatively impact grizzly bears.

Additionally, in its notice in the Federal Register for promulgation of the 10(j) rule associated with this project, USFWS specifies the following requirement for grizzly bears: "Grizzly bears also need large, intact blocks of land with limited human influence and thus low potential for displacement and human-bear or livestock-bear interactions that could result in human-caused mortality. [emphasis added] (USFWS, 67197). Given that USFWS itself, working on this very same project, singles out low potential for livestock-bear interactions as important for avoiding human-caused mortality, the presence of livestock on grazing allotments in or adjacent to the NCE needs to be taken seriously and impacts to grizzlies must be analyzed accordingly.

Despite the known impacts of adjacent active livestock allotments on grizzly bears, like those observed in the GYE, and those noted by USFWS, the grizzly bear subsection of Chapter 3 analyzing the projected impacts to the species barely mentions livestock grazing. Throughout the 9

pages of text and maps devoted to analyzing the impacts of reintroduction on grizzly bears, the term 'livestock' appears all of three times, and the phrase 'cattle and sheep grazing' is used twice, with not a single section heading devoted to this issue. Most concerning, when it comes to the specific impacts of nearby USFS grazing allotments, the 'analysis' comprises all of one sentence: 'Cattle and sheep grazing on USFS lands could have adverse impacts on grizzly bears if conflicts with grizzly bears occur.'(DEIS, 62).³

Despite NPS knowing the precise location of each USFS allotment, the type of livestock grazed on each, along with their stocking rates, there was no further attempt to analyze the impacts to grizzly bears⁴. Foregoing this meaningful analysis ignores the major role that the presence of livestock plays in grizzly bear mortality. With this grazing permit information, outdated as it is, NPS possesses actionable, quantifiable, non-hypothetical knowledge that an activity with direct, often negative impacts on grizzly bears is almost 100% certain to occur within and adjacent to the NCE and the project area. This simply defies reason and does not meet the level of robust analysis required under NEPA for an EIS.

Footnote 2: Pils, A., Becker, S., Frey, K. Gunther, K. Hnilicka, P., Nicholson, J., Thompson, D., Tyers, D.(2020). Recommendations for reducing bear-human conflicts and grizzly bear mortalities in the Yellowstone Ecosystem: a report to the Yellowstone Ecosystem Subcommittee.

Footnote 3: Conversely, at least three entire pages of analysis were devoted exclusively to the impacts that grizzly reintroduction would have on livestock producers (DEIS, 143-146).

Footnote 4: Regarding this allotment information, it is concerning that NPS cites figures from 2015 (see DEIS, 138), information which will likely be a decade old by the time grizzlies are actually placed on the landscape. Acquiring current information on the Okanogan-Wenatchee NF grazing program would not only contribute to a more accurate analysis, it would simply be a matter of asking OWNF for it (a basic component of interagency coordination that was not followed here).

Interagency Planning & Coordination on Federally Permitted Livestock Grazing:

Our previous comments highlighted the particular importance of working directly with the USFS on the issue of active and/or vacant livestock grazing allotments within and adjacent to the NCE. This especially applies to the Okanogan-Wenatchee NF (OWNF), given that this federally managed Forest contains all of the active and/or vacant grazing allotments within and adjacent to the NCE (DEIS, 138).

Throughout the DEIS there are repeated vague and rather brief references to interagency planning and cooperation playing a role in preparing for grizzly reintroduction in the NCE.⁵ While this may have been true when collaborating with USFWS, the apparent lack of meaningful agency-to-agency planning when it comes to the USFS is very concerning. This is especially the case when it came to working with the Okanogan-Wenatchee NF(OWNF) and its multiple active and vacant grazing allotments.

In our previous comments we offered detailed suggestions and examples of preemptive measures that could be taken now to avoid the need to hastily react later. These suggestions included incorporation of non-lethal conflict deterrence measures into grazing permits and/or Forest Plans. Citing the Flathead NF in Montana as an example, we provided clear language already used by another National Forest to proactively address the potential for bear-livestock conflict. The referenced Flathead NF standard included this language: 'new or reauthorized livestock grazing permits and annual operating plans shall incorporate requirements to reduce the risk of grizzly bear-human conflicts [and] include a clause providing for modification, cancellation, suspension, or temporary cessation of activities, if needed, to resolve a grizzly bear-human conflict situation.' We also suggested that these additional measures be incorporated into USFS grazing permits:

- Immediately removing and composting livestock carcasses found on the allotments;
- Removing sick or injured livestock from the allotments, so they are not targeted;
- Delaying turnout until after mid-June, so that native ungulate young can provide a food

source;

- In the event of depredation, if future depredations are feared or anticipated, livestock should be moved to private pastures;
- Keeping livestock in open, defensible spaces to reduce opportunities for ambush predation;
- Prohibit the turnout of young calves and lambs under 200 pounds in weight to reduce depredation potential, and protect calving and lambing areas with deterrents such as electric fencing;
- Require human presence by using range riders and guard animals and frequently checking livestock.

Footnote 5: Beyond the sharing of disconcertingly outdated figures on the OWNF grazing program, the extent of interagency collaboration in the DEIS appears to consist of a mere two sentences: “The USFS has participated in internal planning meetings, including the internal scoping and alternatives development meetings. The USFS has also contributed to the development of this plan/EIS in describing the affected environment and addressing potential impacts that could result from actions in the Mt. Baker-Snoqualmie and Okanogan-Wenatchee National Forests.”(DEIS, 155). This vague statement is never elaborated on and there is no indication that NPS even broached the idea of grazing permit modifications, the incorporation of non-lethal deterrence measures, or the possibility of voluntary permit retirement.

Bringing about these necessary changes in grazing management would require meaningful interagency collaboration and consultation with OWNF and would need to be included and analyzed in the DEIS. There is no evidence in the DEIS that this occurred.

Additionally, in previous comments we suggested collaboration with the OWNF on the possibility of voluntary permit buyout and permanent retirement of grazing on these allotments, something that would definitively remove the risk of bear-livestock conflict in these key areas while justly compensating affected permittees. This win-win option does not appear to have even been discussed with the OWNF and was never entertained in the DEIS.

Given that the multiple active and vacant grazing allotments on the OWNF represent the closest known grazing operations to the NCE, it is doubly concerning that none of the above options were broached with the Forest Service or otherwise analyzed in the DEIS. The NPS itself has this to say regarding proximity to livestock and the risk of depredation: “The extent of depredation would be most influenced by the extent that livestock overlap with grizzly bears, the size of the grazing operation, and the presence of attractants.”(DEIS, 144). Without a doubt, given their proximity to the project area, the grazing allotments on the OWNF are most at risk of overlapping with grizzly bears, with several of these allotments actually contained within or bordering Management Zone 1 (the core Zone that contains all release and staging areas for reintroduction). These are the only locations within this area where it is known for a fact that livestock will be present. It is a reasonable assumption, given the proximity of these allotments that when (not if) there are bear-livestock conflicts, they will likely occur here (especially as populations grow and expand their range). It defies reason for NPS not to address this inevitability now, rather than hastily and on the fly at a later time.

Regarding release and staging areas, the DEIS has this to say about the impacts these will have on livestock in these allotments:“...these impacts are somewhat less likely to occur given that no staging or release areas would overlap active grazing allotments. Figure 17 shows current, active grazing leases in the NCE closest to the potential release areas.”(DEIS, 144). Upon examining the map referenced here as “Figure 17”, it is concerning to notice that staging area F appears to be touching the border of an active grazing allotment, and that the nearby release area appears to be between 10 or 15 miles from this same active grazing allotment (DEIS, 145). The DEIS has this to say about grizzly movement after translocation: “After recovering from capture and translocation events, grizzly bears entering novel environments tend to have higher movement rates, greater displacement, and spend more time in poor-quality habitats and habitats with higher mortality risk compared to resident bears (Stenhouse et al. 2022).” Placing bears with potentially “higher movement rates” so near an active grazing allotment - an allotment where no effort has been made to implement non-lethal conflict deterrence measures - defies reason and appears designed to not

only ensure conflict, but also to ensure that any measures taken will be hasty and purely reactive (increasing the likelihood of lethal removal).

Finally, the lack of any attempt to propose, analyze, and subsequently collaborate with a partner federal agency on preemptive measures like non-lethal conflict deterrence, vacant allotment closure, permit modification, and permit buyouts is even more concerning when Alternative C and its associated 10(j) rule has been chosen as the NPS preferred alternative. This concern arises from the fact that, per the DEIS, a 10(j) rule will preclude the possibility of consultation under section 7(a)(2) of the Endangered Species Act for any federally permitted actions. The DEIS outlines what consultation would require of USFS permitted livestock grazing, were it to apply: "agriculture and livestock grazing operations on USFS lands would also be subject to ESA consultation requirements under section 7(a)(2), which requires the USFS to avoid jeopardizing the continued existence of a listed species like the grizzly bear. As a result of the consultation process, efforts to minimize or avoid those adverse effects may be required. These efforts, such as requiring removal of cow carcasses quickly to avoid attracting grizzly bears, could adversely affect grazing and agriculture activities seasonally. Additionally, adhering to no net loss of core bear habitat has the potential to affect use of motorized activities to manage cattle, such as restricting road development." (DEIS, 146).

In choosing to eliminate the above consultation requirement through adoption of a 10(j) rule, and by refusing to coordinate meaningfully with USFS to adjust or modify grazing permits, the NPS will be reintroducing grizzly bears into an environment where capture and/or lethal removal appears to be the only plan. The inadequacy of this plan is shockingly apparent in the meager one sentence statement offered in the DEIS that addresses conflict on these allotments: "If a bear frequents an allotment area, the FWS and WDFW would work with the USFS and livestock owners to determine the best course of action to minimize bear-livestock interactions." (DEIS, 146).⁶ This is essentially a "plan to develop a plan" and is the epitome of kicking the can down the road while enshrining a purely reactive management program, all while refusing to meaningfully address a conflict-prone, federally permitted activity taking place on the doorstep of the reintroduction area. NPS is choosing to silo itself off from a supposed partner federal agency and, in so doing, abdicating its responsibility to conduct the rigorous, thorough analysis required in an EIS. Though it may not have direct authority to dictate USFS actions and policies, it can at the very least cooperate in a meaningful way and develop a plan that is comprehensive and holistic. This includes working with the USFS to incorporate the various measures and preemptive planning outlined above. Grizzly bears do not recognize artificial agency boundaries imposed on a landscape, nor do they recognize differing agency mission statements. Any plan that aims to establish a thriving grizzly population in the North Cascades would do well to recognize this fact.

2). Alternative B:

For many of the above mentioned reasons, among the alternatives offered, WWP supports Alternative B. As the DEIS itself has clearly demonstrated, there appears to be neither the desire nor the will on the part of NPS to foster interagency planning to meaningfully address federally permitted livestock grazing on the OWNF. Alternative B puts more of the onus on agencies and federal permittees to adapt non-lethal, coexistence, and/or deterrence measures via the consultation requirement. Meanwhile, Alt C appears to simply remove any obligation to be proactive on the part of USFS and its permittees. They are given wide discretion to capture and/or kill a bear without requiring much of any prior effort to avoid conflict. Absent any stipulations, regulations, or other requirements, consultation under section 7(a)(2) is the only way to ensure that USFS will be impelled to adjust its grazing administration on those allotments where it is clearly needed. Whether through the modification of permits or AOIs, or whenever a permit is renewed or reissued, the protections afforded under Alternative B will make sure federal agencies do not authorize livestock grazing that results in unacceptable impacts to grizzly bears without first analyzing those actions and ensuring that jeopardy does not occur. If NPS refuses to take preventative, proactive steps regarding USFS grazing permits, as has been the case so far, then consultation is the only way to protect grizzly bears

Footnote 6: It is worth noting that this language found in the current DEIS appeared, verbatim, in the previous DEIS and its inadequacy was highlighted in our previous scoping comments. It also undermines the NPS claim that the current DEIS is “new”. When it comes to livestock grazing, there appears to have been very little change from the previous DEIS.

from lethal take as a result of inevitable depredations on federal grazing allotments (with some active allotments being less than 20 miles from proposed release areas)

3). Canadian Reintroduction Plans:

Regarding the potential for reintroduction of grizzly bears into the NCE immediately across the border in Canada, the DEIS states the following: “Should reintroduction efforts occur in British Columbia, it is likely that some grizzly bears reintroduced into the Canadian portion of the ecosystem may move into the US portion of the NCE, either as a transient and return to Canada or may ultimately remain in the US.” (DEIS, 62). This statement is no longer applicable and now requires revision in order to reflect current reality, in addition to an analysis of what the impacts of Canadian reintroduction will be on the NPS plan. This is due the fact that the Okanagan Nation Alliance, with the help of the BC Ministry of Water, Land, and Resource Stewardship, has announced definitive, concrete plans to reintroduce grizzly bears just across the border from North Cascades National Park in Canada. This reintroduction has now moved from a hypothetical scenario to a definitive plan, complete with a timeline. This was announced to the Interagency Grizzly Bear Committee at a meeting held on October 10, 2023. During this meeting, Dr. McKenzie Clarke, a wildlife biologist with the Okanagan Nation, declared the intent of the tribe to finalize a restoration plan by the winter of 2023, followed by actual relocation in the summer of 2024. A staff member representing WWP at that meeting asked Dr. Clarke a follow up question regarding the specific areas slated for reintroduction. Dr. Clarke stated that the focus will be in “priority units” that are south of Canadian highway 3.7 This would place reintroduced Canadian grizzly bears immediately across the border from North Cascades National Park within less than a year, all but guaranteeing emigration of these bears south into equally suitable habitat in the American NCE.

Though this information regarding Canadian reintroduction plans was revealed after the completion of the DEIS, it is absolutely crucial that the Final EIS incorporate this new development and analyze its overall impacts to the NPS plan. With relocated Canadian bears likely to already be on the ground before NPS finalizes its EIS and issues a Record of Decision, it is imperative that NPS update its planning and analysis to account for the impacts of additional bears coming down from Canada, as well as take into account the management plan adopted by the Okanagan Nation and the BC government. It is also imperative that meaningful consultation with the Okanagan Nation take place, especially regarding the liberal lethal take measures that will apply under a 10(j) rule to any Canadian bear that wanders south across the border.

Conclusion:

As stated the outset, WWP is heartened to see the grizzly reintroduction process move forward in earnest, after years of delay. Placing these important predators back in the NCE goes some way in righting the ecological harms inflicted in the past. However, as also noted above, the DEIS appears to lack any substantive interagency cooperation, analysis, and proactive planning when it comes to livestock grazing permitted on federal lands, especially by the USFS. There is still time to add these crucial components into a Final EIS and work closely with the OOWNF to modify and prepare their permittees and their grazing program for the presence of grizzly bears. We hope NPS takes this opportunity to do so. Thank you for your time and for the opportunity to provide these comments.

Sincerely,

Montana & Washington Director

Correspondence: I also own a home in Wilson Wyoming (near Jackson). My home is about 4 miles from Grand Teton National Park (GTNP), where grizzly bears are also found. I have been visiting the Jackson, Wyoming area for about 15 years before buying my home, which I have had for 10 years now. In all this time, I have never heard of a human-grizzly bear interaction in GTNP or Jackson or Wilson where there's been an injury or death. Indeed, I don't recall any cattle-grizzly interaction where there's been a death or injury to the cattle. However, there are occasional maulings and sometimes deaths from grizzly human interactions; these generally occur during hunting season or outside Yellowstone National Park.

It is possible for grizzly bears and humans to co exist without interaction.

The presence of the grizzly bear is a great tourist attraction for both Yellowstone NP and GT National Parks and enhances the park tourist visitations.

I think these bears can be managed quite well as the experiences in Yellowstone and Grand Teton show.

On the rare occasion, that the grizzly bear roams through Wilson or Jackson, there has not been any adverse interaction with humans.

I favor the re-introduction of the grizzly bear to the north Cascades of Washington State.

Correspondence: I am writing to express my support for the reintroduction of grizzlies in the North Cascades.

Here are some of the reasons:

Where grizzlies thrive, ecosystems thrive. These bears regulate populations of the animals they prey on and keep forests healthy by dispersing seeds and berries.

Additionally, the population of bears on the Canadian side of the North Cascades ecosystem is considered critically endangered, and wildlife biologists do not believe a natural recovery is possible. Reintroducing bears on the U.S. side will complement significant efforts led by First Nations in Canada to bring back this sacred cultural species.

Restoring grizzly bears would benefit North Cascades National Park and the people who enjoy it. A restored population will boost the park's appeal and attract nature enthusiasts, scientists, and tourists from around the world. This would provide economic benefits to local communities and support the park's mission to protect park resources.

Alternative C, with the 10(j) rule, provides managers flexibility to address community concerns while protecting the grizzly

population. It ensures coexistence between humans and bears.

Please consider the positive ecological and economic benefits and support Alternative C. Restoring grizzly bears will secure the park's natural heritage and conserve an iconic species for current and future generations.

Thank you very much!

Sincerely,

■

Correspondence: Introducing more Grizzly Bears anywhere in Washington is a horrible idea. It would be bad for already dwindling number of big game populations. It would also be bad and most likely deadly for the residents and tourists who enjoy the outdoors in Washington state. There are already Grizzlies in Washington State it's time to stop playing with predator populations as it has already been a disaster with the Wolves.

Correspondence: I do NOT support reintroducing grizzlies in the northern Cascades even if it's a slow roll out. I'll be long gone and so will current decision makers. The consequences of intentionally reintroducing grizzlies will negatively impact people not yet born. I do not believe the benefit of reintroduction outweighs the potential risk of lives lost.

The Upper Skagit Tribal representative, Scott Schuyler, states "the Upper Skagit successfully coexisted with grizzly bears for thousands of years, and we should once more." We live in a different time with a 21st century population. The mountain ranges in the west are enjoyed by millions of people. The way the land is used and shared by people and animals has changed. This is not the 17th century. And the statement that grizzlies are now needed for the ecosystem in northern WA is false. The ecosystem has adjusted over the years without the presence of these bears.

THE OPTION TO TAKE NO ACTION AND RELY ON "NATURAL RECOVERY" IS THE APPROPRIATE DECISION. Currently bears are free to roam where they want. So if grizzlies make their way to the northern Cascades, so be it. But if grizzlies are intentionally reintroduced in the northern Cascades, then they are also free to roam into Oregon and northern California. And then into the Sierra Nevada. That will be a game changer.

Correspondence: I am a hesitant proponent in re-introduction of grizzly bears in the North Cascades as long as the intention is to correctly manage their populations with the traditional model of hunting in North America. Re-introducing grizzlies will be a great thing for the landscape BUT if there are protections in play in WA State to limit or ban predator hunting, this species along with others will damage the deer and elk populations and result in human bear interactions and predations. We see this with cougars and black bears, and may be on the cusp with wolves. Bears, like wolves, will impact the game populations negatively and lessen tag revenue and overall opportunities for those who enjoy the outdoors in such a way. Not to mention that fact that they go for easy prey and do not understand lines on a map.

It must be documented that state fish and game biologists will have the final say in how this and all species are managed, not special interest groups or people voting on emotions or "social reasons". Bears are dangerous, exceptional predators, smart, and amazing animals. Lets not re-introduce something and create a ripple affect of problems that seemingly dont have solutions.

Lastly, are there grizzly bears already there?

Correspondence: I strongly support restoration of grizzly bears to the North Cascades ecosystem as proposed in the Grizzly Bear Restoration Plan EIS. I respect the perspectives and concerns of all who have a stake in this region. But it is imperative to allow science and fact, not fear and misinformation, to guide decisions - and to acknowledge that it is not just humans who have a stake in this region. By restoring grizzly bears to the North Cascades, we create opportunity for hope, sustainability, awe and inspiration.

The footprints of humanity now impact even the last slivers of open space on earth. Our future, and the future of all life depends on the presence of healthy, functioning ecosystems. Grizzly bears are an integral and irreplaceable part of the North Cascades ecosystem.

Thank you for your consideration.

Correspondence: As a back country user and a high country user , I'm not a fan of reintroducing grizzly bears. The back country and high country have been places that I've shared with my young children. While those wild places are absolutely NOT without hazard, at least being eaten is not generally one of the dangers.

I would not really consider visiting the Yellowstone Backcountry as a backpacker for the same reasons. Rather than managing the forest and Backcountry for preservation and public use you'd be managing it for some long gone mythical ideal of the way things used to be. You might as well reintroduce them to downtown Seattle 'because thie bears _used_ to live

there . The logic is exactly the same, and equally poor.

Pardon me for typos, this from my phone.

Sincerely [REDACTED]

Correspondence: Reintroducing grizzlies west of the crest of the Cascade Mountains would be a mistake. There is not much in the way of food sources in the dense fir and hemlock forests on the west side. The primary places for many foods, including berries, field mice, moles, and conies, are not in those forests, but either in the comparatively small alpine and subalpine meadows just below the rocks and snowfields, and in the now fairly densely populated river valleys that are at surprisingly low elevations on the West side of the range. Global warming may well lead to such moderate winter temperatures on the West side, especially at the lower elevations, that the both black and grizzly bears might undergo a greatly reduced or even a zero period of hibernation. That would doubtless lead to unfavorable interactions with humans even during the winters. The east side of the cascades is rather different, exhibiting much more open pine forests and larger alpine and subalpine meadows over a much larger range of altitudes, and the river valleys are less densely populated than on the west side. The eastern slopes are typically much colder in winter, so the bears there are more likely to hibernate during winters on that side.

In 2015 discussion with a wrangler in the Bob Marshall Wilderness Area (BMWA), just south of Glacier National Park, I was informed that "problem" grizzlies in Glacier Park are trapped and transported to the BMWA, where they are released, and "we take care of them." By we, he was referring to himself and other wranglers in the BMWA. What will you do with the problem bears in the North Cascades National Park, and where to you propose to release those "problem bears", which surely will appear at some point?

Please give these problems careful thought before going through with this plan. Cheers! [REDACTED]

Correspondence: Sierra Club logo on top of a photo of an orca jumping out of the water.

The National Park Service is accepting public comments on grizzly bear restoration in the North Cascades. Deadline for comments is 10:59pm, tonight, Monday, Nov. 13th.

Join Sierra Club in supporting grizzly bears' restoration to their ancestral homelands. Help grizzlies make a comeback and enhance the vibrant biodiversity and the wild character of the North Cascade ecosystem. See below for sample text!

Comment before midnight!

Dear John,

Get ready to roar for a cause that truly matters. Grizzly bears once roamed Washington's Northern Cascade Mountains for thousands of years - but have since been hunted, trapped, poisoned to death, and exterminated from the wildest parts of our state.

Since 2015, the Sierra Club has supported restoring grizzly bears to their ancestral homelands in the North Cascades. Right now, the National Park Service is accepting public comments on their draft grizzly bear restoration plan through November 13th, 2023.

Grizzly bears are a keystone species whose presence contributes to the health of our wildlands. Their presence is a sign of a fully wild and intact landscape that supports all life.

We know from successful efforts in the Northern Rockies that it is absolutely possible to live, work and recreate with grizzly bears on the landscape. Conflicts can be prevented through proven, effective measures.

Help grizzlies make a comeback in Washington and contribute to the vibrant North Cascades ecosystem. Help protect and enhance biodiversity and the wild character of the North Cascades.

Before 11pm tonight (November 13th), please take a moment to:

Copy the advocacy text located below the grizzly bear graphic.

Click on one of the comment buttons or graphics itself.

Fill out your contact information and paste the advocacy text from step 1.

To whom it may concern,

I am writing to support the restoration of grizzly bears to the North Cascades Ecosystem, their historic range for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C but with needed changes to the proposed 10(j) rule. The proposal would bring up to 25 non-conflict grizzly bears - likely from Montana - into remote areas of the North Cascades over the next decade and manage them as an experimental population.

The proposed 10(j) rule as currently written fails to give grizzlies the best chance to succeed and is too permissive in allowing reintroduced bears to be killed.

Lethal removal of a grizzly bear should only be considered where there is a demonstrable threat to human safety, and, for non-immediate threats to human safety, only after non-lethal management options, including concerted use of conflict prevention methods, have been exhausted.

No grizzly bears should be hazed or relocated as a result of conflict with livestock unless demonstrable, repeated efforts have been made by the livestock producer to prevent such conflicts, using commonly-available techniques.

No grizzly bears should be killed on public lands as a result of livestock depredation.

Landowners/private citizens should not be given a permit, or otherwise authorized, to kill a grizzly bear.

No grizzly bear should be preemptively relocated if the bear is not a threat to human safety, particularly if the bear has not become habituated or food-conditioned, or when nonnatural foods/attractants have not been properly secured and made inaccessible to bears. Doing so acts as a disincentive for communities to employ conflict prevention measures, and increases the risk to the bear of injury or death from capture and relocation.

These changes are crucial in providing adequate protection for grizzly bears.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C and with appropriate changes to Section 10(j). Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Correspondence: Please move forward with the plan to bring Grizzly Bears back to Washington State. They are an important part of the ecosystem.

Additionally, the NPS should prioritize protections for grizzly bears over livestock grazing. It is unnecessary and counter-productive to focus on "management" of grizzly bears for the benefit of the livestock industry.

Grizzly bears should have the same protection under the Endangered Species Act that all populations have. The USFWS should not have a special rule for the grizzly populations that will be in Washington State.

The final restoration plan should account for human behavior in the effort to minimize human-grizzly interactions, because let's be honest, it's usually the humans at fault when there is a negative human-grizzly interactions. Don't make the grizzle bears pay for human stupidity.

Correspondence: No Grizzly in the Cascades, Please

It is my understanding that the Cascade Mountains are already at capacity for Grizzly Bears. There is neither food resources nor space for an increased grizzly population.

Thirty years of observation, which included mountain climbing, have shown me that the Cascades are drying out and warming up.

There are many glaciers and "permanent snowfields" that have been erased from the mountains in the past few decades.

Lack of precipitation coupled with deglaciation and forest fires have reduced habitat for ALL creatures in the Cascades.

The grizzly bears that wander into the Cascades already do a thorough job of consuming the limited resources available.

No longer are there salmon jumping out of the rivers in the North Cascades, the seasonal berries are not as abundant as in the past, and every square mile of habitat seems to be under constant threat from wildfire.

Alternative "A" (no action) is the only way I see forward in the next decade. Thank you.

Correspondence: I honestly don't understand the need to re-populate the Grizzly bears in our area. Why would you want to do that? No matter what you might say, or think, there will be human loss. Bear spray is ineffective, and I have heard many people in our area say that they are going to carry a gun, while hiking, if this becomes a reality. And we all know that more people with guns in the forest isn't good for anyone. Please do not bring Grizzlies here.

Sincerely,

Correspondence: Thank you to the agencies and individuals who prepared and reviewed the DEIS document, who have solicited and considered public comments, and who continue the difficult process of grizzly bear recovery in the North Cascades.

I am writing to enthusiastically support Alternative C and implementation of the 10(j) rule in the North Cascades. I think it is the balanced, conservative approach we need to re-learn how to coexist with grizzly bears in the North Cascades.

I am a PhD candidate in [REDACTED] interdisciplinary Institute for Resources, Environment, and Sustainability. My background is in environmental psychology and sociology. I currently serve on the [REDACTED] Grizzly Bear Stewardship Steering Committee and have conducted research about the social dimensions of grizzly bear recovery in the North Cascades as my dissertation research in collaboration with that group, as well as in collaboration with the US NPS and USFWS. The opinions and feedback I express here are my own and do not represent the [REDACTED].

I will share a few substantive, (hopefully) constructive comments regarding details in the DEIS document and will share preliminary findings from my research about perceptions of grizzly bear recovery among Manning Park residents and interviews I have conducted with large carnivore recovery experts around the world.

Comments regarding the DEIS:

(1) The DEIS's "Socioeconomic" impacts sections engage almost exclusively with concepts of value that are economic in nature. It says, "The analysis of socioeconomic impacts considers potential effects on employment, population, and revenue from natural resource-related activities and revenue from park and national forest visitation that may result from grizzly bear restoration under each alternative."

There is extensive evidence demonstrating that values that are non-economic in nature have important positive and negative consequences in peoples' lives, and I do not see other kinds of socioeconomic value addressed in the DEIS. For example, the Intergovernmental Science-Policy Platform on Biodiversity and Ecosystem Services (IPBES) is the global body charged with strengthening the science-policy interface for conservation and sustainable use of biodiversity, human well-being and sustainable development. They recognize that people have broad values (guiding principles and life goals) and specific values, which are judgements about the importance of nature in particular situations. This latter category can be further split into three categories: instrumental (nature as a resource and asset, usefulness), intrinsic (agency of other-than-humans, inherent worth of biodiversity), and relational (importance of desirable, meaningful, and often reciprocal human relationships) (see the IPBES report, p. xxiii, for a nice summary graphic <https://zenodo.org/records/6522393#.YswYWOzMK3J>). A key message from this global document is that "Achieving sustainable and just futures requires institutions that enable a recognition and integration of the diverse values of nature and nature's contributions to people" (p. xvii). I believe that socioeconomic considerations from a proposal like grizzly bear recovery, can and should address ideas related to multiple values, ranging from health benefits, ideas about rights and responsibilities to others, cultural meaning, sense of place, prosperity, ways of life, etc.

I also believe, after studying this issue, that the economic concerns expressed by interest groups are rooted in deeper concerns about ways of life, power dynamics, cultural preservation/loss, social norms and group dynamics that are better understood through non-economic valuation processes. I believe that reducing the "Socioeconomic" analysis to jobs and economic activity is an oversight that should be addressed in the FEIS and implementation process.

(2) Relatedly, while I see that there are plans for monitoring the ecological outcomes of this project, and some intentions to monitor conflicts and economic outcomes, I do not see evidence in the DEIS for monitoring other social outcomes. One of the rationales for grizzly bear recovery mentioned in the DEIS's "Need for Action" statement is to "Contribute to the restoration of biodiversity of the ecosystem to build ecological resilience and for the benefit and enjoyment of present and future generations of people." (p.3). How do you plan to monitor the ideas of benefit and enjoyment? What expertise do you need to bring on to set up a monitoring plan to understand whether or not this project is meeting this objective?

(3) Relatedly, I am concerned about the lack of social scientists on your team of expert preparers and reviewers. It appears that technical expertise supporting this effort includes almost exclusively people with ecology/wildlife biology backgrounds, and a few individuals with cultural resource/anthropology expertise. I am concerned about the capacity of this team to adequately address the above sociological and psychological dimensions of recovery planning. I encourage the agency to consider including scientific expertise from the fields of psychology, sociology, marketing and communications, risk perceptions, behavioral economics, and other social science disciplines. Often one "social scientist" is brought onto a team to address all of the social dimensions. I suggest that you include multiple social scientists with diverse disciplinary expertise.

(4) Throughout the DEIS, the impacts on "visitors" are considered. People who do not set foot in the recovery area may also be significantly impacted by the decision to recover or not recover grizzly bears in this area. The concept of "existence value" (e.g., Krutilla 1967, Conservation Reconsidered) is widely accepted across the environmental values literature. This concept reflects that people derive benefit (often manifesting as a sense of well-being) by simply knowing that elements of biodiversity exist, even if they never utilize or personally experience it. I think that existence value (or "non-use value") is an extremely important concept for understanding how grizzly bear recovery efforts affect peoples' well-being that does not seem to be accounted for in the DEIS.

(5) Throughout the DEIS, there is a consistent message that "Alternative A: No Action" would not have impacts. Please consider that building up expectations/anticipation for GB recovery and then not following through on that action may have significant psycho-social impacts on visitors (and others). Please consider reviewing the "ecological grief" literature (e.g., DOI 10.5040/9781350233164.ch-5)

(6) As I understand, there is new guidance from the White House that states that, "Indigenous Knowledge is a valid form of evidence for inclusion in Federal policy, research and decision making." (<https://www.whitehouse.gov/wp-content/uploads/2022/12/OSTP-CEQ-IK-Guidance.pdf>). This directive seems relevant to North Cascades grizzly bear recovery, and I do not see it reflected in the DEIS.

(7) On page 17 the DEIS states that "The joint US/British Columbia commitment to recover grizzly bears in the North Cascades is stated through a Memorandum of Understanding between the provincial government and the IGBC (North Cascades Grizzly Bear Recovery Team 2004)." As I understand, the Province of BC has not committed to supporting/issued a mandate to support grizzly bear recovery in the North Cascades at this time. I wonder if this policy position is up-to-date.

(8) I also think that policy directives from Indigenous governments should be included part of the relevant policy framework, especially given our federal government's commitment to Nation-to-Nation relations.

(9) p.31 - The DEIS has very vague plans about public education and outreach. There is substantial evidence that "knowledge deficits" are often not the main problem for changing behavior, and that efforts to change cultural understandings/meanings, incentives, habits/behavioral nudges, power dynamics, norms, etc., are more effective. I am concerned that the education/outreach planned may not be adequate to protect the safety of people and recovering bears. I think it is important to draw from social science theory and concepts and have social scientists review education and outreach planning in order to integrate best available science about behavior change, developing multidimensional trust between managers and communities (e.g., Stern and Coleman 2015), understanding how people assess risk and hazardousness, develop habits, make quick judgements, and more.

(10) Many of the safety precautions mentioned in the DEIS rely on collaring bears and monitoring their movements. However, many collars fail and any cubs born will not have collars. Do you anticipate re-collaring bears who lose collars, or collaring bears that are born into the system? Do you anticipate any resistance to the process of collaring bears (as has occurred in some areas of BC)?

(11) p. 68 "Bear captures in source areas would be done in coordination with British Columbia wildlife managers and with appropriate permits or approvals in place." I suggest that this should also include coordination with First Nations, including appropriate ceremonies and cultural protocols, not just British Columbia representatives.

(12) I am an avid backcountry recreationist in the North Cascades and have travelled extensively throughout all of the proposed release areas and recovery zones. I am concerned about the lack of bear-resistant food storage and sanitation facilities throughout some of these areas, especially in popular cross-country zones and USFS/State lands. I am especially concerned about bear encounters in cross-country zones because mountaineering parties may be less likely to comply with requirements to carry heavy bear deterrents and cannisters (because they are already carrying heavy equipment deep into the backcountry) and may be less likely to comply with the requirement to obtain permits (where they may get bear safety information). I am also concerned about the lack of bear-safe infrastructure at USFS and WA DNR sites because I believe encounters will be more likely at these sites given the relatively easy access to/lax management of attractants, and people recreating at these sites will also be more likely to have guns that they may use to kill the reintroduced bears.

(13) Potential typo (?) on p.119. The third issue statement doesn't make sense to me. It reads, "Depending on the type and location of visitors' attitudes and preferences, ..." Should it say visitor activities?

In addition to these comments on the DEIS, I will share a few observations from a study in Manning Park conducted in 2023. We randomly selected 113 visitors and conducted 30-60 minute, face-to-face surveys with them, in which we discussed their values about bears, opinions on grizzly bear recovery, knowledge/behaviors with regard to bear-safe behaviors, and more. I think the following findings are relevant to the US process:

- There was very little awareness of grizzly bear population declines in Manning Park. The vast majority of Park visitors thought there was still an active population of grizzly bears in the Park.
- There was little awareness of grizzly bear recovery efforts. Only 8% said they were "somewhat" or "very" aware of the proposed efforts.
- There was very high in-principle support for grizzly bear recovery among the Manning park visitors we surveyed. Only 7% said they were slightly to very unlikely to oppose recovery.
- There was mixed knowledge & uptake of bear-safe behaviors. In particular, visitors stated that they had and/or would have left out many bear attractants, especially BBQs, insect repellants, dish soap, empty food and beverage containers, empty coolers, toothbrush/toothpaste, etc.
- Their stated willingness to accept a variety of personal and management changes for bear coexistence was very high.

I will be happy to discuss the findings of this survey with the agencies if you would like to know more. I expect to submit the results for publication within the next year.

I have also conducted a set of interviews with large carnivore recovery experts from around the world about the outreach and engagement efforts they used in their efforts. I would also be happy to discuss these findings with the agencies. I also expect to submit the results from those interview for publication within the next six months.

Thank you for your consideration,

Correspondence: 1. With climate change affecting the timing and quantity of food availability for Grizzly bears, past data of bear encounters must be viewed skeptically. The bears' typical locations and behavior may change significantly. Earlier in 2023, in Banff National Park, Canada, two experienced hikers did everything right, but were still killed by a Grizzly. One theory about this encounter is that the Bear was desperate for food because the plant foods that are typically available at that time of year were not present due to drought and/or temperature anomalies.

2. Evidently the National Park Service has "no plans to install bear wires for hanging food or to make any changes to existing frontcountry or backcountry campsites" as reported in the Seattle Times. I wonder if it will take fatal attacks for the Park Service to decide to install electric fences around front country campgrounds such as those that have been installed around certain campgrounds in Banff National Park. Staying in a campground surrounded by an electric fence will probably protect the campers from bears, but it ruins the wilderness experience in my opinion.

3. I am not aware of any peer-reviewed science that provides evidence that Grizzly Bears are "keystone species." The absence of wolves from Yellowstone clearly created a cascade of undesirable ecological changes in the Park, so it is clear that wolves in that ecosystem are a keystone species. I've seen nothing like that ecological cascade of changes in the North Cascades related to the absence of Grizzly bears.

4. I oppose the Park Service's proposal to reintroduce Grizzly Bears into the North Cascades. For the person who wants to hike in the backcountry, it will be like deciding to play Russian Roulette.

Correspondence: If grizzlies are reintroduced in the North Cascades, they must be federally protected. They cannot be killed for killing a domestic animal. WA Fish and Game cannot harm the Grizzlies or kill them because they have been in contact with humans.

Bringing Grizzlies only to kill them is out of the question.

Again the Grizzly needs to be completely protected under federal and state protection.

Thanks

Correspondence: Dear Superintendent Striker and Supervisor Thompson,

Thank you for the opportunity to comment on the Draft Grizzly Bear Restoration Plan/Environmental Impact Statement: North Cascades Ecosystem (Draft Plan/EIS) and Proposed Rule regarding Establishment of a Nonessential Experimental Population of Grizzly Bear in the North Cascades Ecosystem, Washington State (Proposed 10(j) Rule or Rule).

These comments are submitted on behalf of Defenders of Wildlife (Defenders), a national non-profit organization founded in 1947 dedicated to conserving and restoring native species and the habitat upon which they depend. Defenders has over 2 million members and supporters nationally, 70,000 of whom reside in Washington State. Defenders has a long history of supporting agency-led grizzly bear recovery efforts by minimizing bear-human conflict, improving tolerance, and providing bear-aware outreach materials and programs to the public. Since 1997, Defenders has invested over \$1.3 million on grizzly

bear coexistence projects.

We are excited that, after considerable public consultation, the U.S. Fish and Wildlife Service (FWS) and the National Park Service (NPS) are nearing completion of a final plan to recover grizzly bears in the North Cascades Ecosystem (NCE). Defenders appreciates the extensive research that has gone into studying and understanding the NCE grizzly bear population and potential opportunities to restore it through translocation. Grizzly bears are one of the most beloved animals in the West, and the vast majority of Washingtonians support actions that would restore this Pacific Northwest icon. They are also the last native mammal currently missing from the NCE. Restoring them to their former range would bring the NCE to a state of wildness seldom seen in the U.S. today.

Consistent with our comments on the previous Draft Grizzly Bear Restoration Plan / Environmental Impact Statement: North Cascades Ecosystem and Proposed 10(j) Rule in 2018, Defenders supports the use of a 10(j) rule as part of the restoration effort to the extent it promotes the recovery of the population, ensures management is humane and prioritizes non-lethal alternatives, and enables humans and grizzly bears to coexist. While we support the overall goals and approach outlined in Alternative C, we recommend several revisions to clarify and strengthen the Draft Plan/EIS and Proposed Rule to ensure they provide adequate safeguards to promote grizzly bear recovery consistent with the best available science. Given that grizzly bears are slow reproducers and dispersers, the Rule would be in effect for quite some time, and it is vital to ensure that it is as protective as possible to foster conservation of the species.

When FWS authorizes the release of a listed species under section 10(j), the accompanying rule must provide for conservation --i.e., recovery--of that species.[1] Specifically, through a 10(j) rule, FWS must ensure that the grizzly bear reintroduction will "further the conservation of the species." [2] Further, each member of an experimental population generally "shall be treated as a threatened species," [3] which makes them subject to "such regulations as [FWS] deems necessary and advisable to provide for the conservation of such species." [4] Similarly, any section 10(a)(1)(A) permit issued by FWS for an otherwise prohibited taking of a grizzly bear must be consistent with the ESA's recovery mandate. [5] Moreover, the National Environmental Policy Act (NEPA) requires the agencies to prepare an EIS in which they "take a 'hard look' at the environmental consequences" of the Proposed 10(j) Rule and "explain their decisions to the public." [6]

Defenders is pleased to note that the current Draft Plan/EIS incorporates much of the feedback we submitted during the previous 2018 Draft Plan/EIS public comment period and the more recent 2022 scoping period. We appreciate inclusion of adaptive management, monitoring tools, implementation costs, and assessment of potential socioeconomic and environmental benefits from the return of grizzlies to the NCE. The following comments and recommendations build on our previous remarks and are intended to strengthen the Proposed 10(j) Rule and Draft Plan/EIS, as well as aid the NEPA process in providing clarity, transparency, and accountability in management practices. Since Alternative C of the Draft Plan/EIS is inextricably linked to the Proposed 10(j) Rule, we have opted to submit comprehensive comments through both agency portals. Minor recommendations specific to either document are captured in Sections VI and VII below.

Our primary concern is to limit population loss in the nonessential experimental population (NEP) by (I) securing sufficient grizzly bear habitat, including through an updated roads and trails inventory and strengthening the definition and implementation of the "no-net-loss-of-core" approach; (II) providing additional measures to avoid human-bear conflict through securing attractants; (III) prioritizing non-lethal deterrence in any conditional take authorization and allowing only authorized agencies (not private individuals) to conduct lethal take; (IV) setting specific population goals, including mortality thresholds, for the NEP; and (V) establishing a robust, specific, and long term monitoring and evaluation plan.

I. Strengthen public land habitat protections and Proposed 10(j) Rule language to more adequately secure grizzly bear habitat.

Defenders is concerned that current habitat protections in the NCE, especially on U.S. Forest Service land, may be insufficient to support long-term population growth of the NEP. The Proposed 10(j) Rule allows incidental take of grizzly bears on National Forest System lands, but it conditions that allowance in part on the Forest Service's maintenance of "its 'no-net-loss-of-core' approach for grizzly bear habitat maintenance agreed upon between the NPS and the Forest Service in 1997. This approach has some limitations, however (see I-B below), and threats underlying its creation persist (see I-A). To the extent possible, NPS and FWS should address these threats within the Draft Plan/EIS and Rule. Beyond that, the agencies should work closely with the Forest Service to take additional actions ensuring habitat threats are

addressed before grizzlies are on the ground. Defenders recommends the following actions:

I-A. Update road and trail inventories in the NCE to give effect to the “no-net-loss-of-core” approach and monitor for rises in trail use since the COVID-19 pandemic.

As noted in the Proposed 10(j) Rule, “road access to grizzly bear habitat likely poses the most imminent current threat to grizzly bears by reducing the availability of [habitat]...and increasing mortality of individual bears through vehicle strikes or other activities associated with human-caused mortality.”[7] Indeed, the term “core area” was defined based on “research showing that bears, notably females, avoid proximity to roads when and where possible, and therefore the presence, use and density of roads is a critical issue for management agencies to address.”[8] The 1997 North Cascades Ecosystem Recovery Plan Chapter also highlights a need to “reduce road densities throughout the recovery zone.”[9]

Despite the generally accepted understanding of the importance of limiting road and trail density in core grizzly bear habitat, no comprehensive analysis of current roads and trails in Management Zone 1 appears to have been performed since 1994. Defenders has repeatedly advocated to the Interagency Grizzly Bear Committee (IGBC) technical working group for the completion of such a study in recent years. It falls under agencies' responsibilities within the “no-net-loss-of-core” approach regardless of whether grizzly bears are present on the landscape.

Now that grizzlies could potentially occupy the NCE within a year or two, an updated roads and trails analysis across state and federal land in the NCE should urgently be conducted to ensure the population's survival. This should include an updated survey of roads and high-use trails, an assessment of the level of threat to grizzlies and/or their core habitat, and identification of priority areas for improvement. Ideally, the analysis would incorporate any relevant data collected by other agencies.

Crucially, this analysis should also include data on high-use non-motorized trails. There is not enough current understanding about how a rise in non-motorized recreation, such as we have seen since the COVID-19 pandemic, may impact grizzly bear recovery. We again invite agencies to make use of Defenders' 2020 North Cascades Ecosystem Grizzly Bear Coexistence and Core Habitat GIS Analyses to supplement the analysis.[10]

I-B. Work with the U.S. Forest Service to strengthen the no-net-loss-of-core approach and ensure that national forests within the NEP Zone formally adopt habitat security standards that will ensure the long-term occupancy of grizzly bears.

As noted in the Proposed 10(j) Rule, the “no-net-loss-of-core” approach was intended to “protect and secure grizzly bear habitat in the U.S. portion of the NCE.” [11] While it is a good start, this approach remains an interim standard between the Supervisors of three National Forests. [12] Apart from maintaining “no-net-loss-of-core” as a condition of allowing incidental take on Forest Service lands, per the Proposed 10(j) Rule, it is entirely incumbent on national forests to uphold this standard, and it is only established “until superseded by a Forest Plan amendment or revision.” While the Rule indicates an intent to memorialize the “no-net-loss of core” in an updated MOU, [13] Defenders is concerned that this approach will be insufficiently protective and unenforceable.

As a starting point, “no-net-loss-of-core” should be formally adopted into the plans, rather than remaining a temporary agreement. This would include the plans for Mt. Baker-Snoqualmie National Forest (MBSNF), Okanogan-Wenatchee National Forest (OWNF), Colville National Forest, Gifford-Pinchot National Forest, and Mt. Rainier National Park. Additionally, collaborate with the Forest Service in setting habitat management thresholds for each Bear Management Unit (BMU) and work to restore habitat to meet them. Accordingly, we urge FWS to incorporate those standards into the Proposed 10(j) rule as a precondition allowing incidental take of grizzly bears.

Strengthening the “no-net-loss-of-core” standard is also vital, as the current approach has limitations that could prove detrimental to the NEP in the long term. For example, the baseline for “no-net-loss” is unclear. Some bear management units (BMUs) in the NCE likely approach 100% secure core because they overlap with Wilderness areas. BMUs on the periphery of the NCE, however, likely have little core habitat and large areas of high road density. This is particularly concerning over the long-term because these peripheral BMUs will be the “launching off” point for dispersing bears.

It is also important to note that baseline conditions, particularly in connectivity areas, may not be sufficient as an indicator of the NEP's ability to grow. This fundamental assumption may be wrong and must be verified; the lack of substantive analysis of actual effects puts a premium on such assumptions being valid. A primary reason that managing for the status quo would be inadequate is that the environment in which grizzly bears live is destined to change resulting in declines in security. We urge FWS and NPS to take this into account when evaluating the success of the NEP.

I-C. Amend the Proposed 10(j) Rule to require that state and private land inside the NCE should be managed as Management Zone 1.

In the Proposed 10(j) Rule, all state and private land inside the NCE will be managed as Management Zone 3 (as opposed to Management Zone 1). While we understand the agencies' desire to grant more flexibility on non-federal lands to deal with conflict bears, defining zones with allowances for mortality based solely on land ownership has the potential to create ecological sinks. If limits on take are loose and resulting mortality is high on state and private lands, these parcels interspersed throughout the NCE have the potential to limit and counteract recovery efforts in the rest of the NCE, especially given that unsecured attractants are more likely on private land.

State and private lands in other grizzly bear recovery ecosystems are not differentiated in this manner. In the Northern Continental Divide Ecosystem (NCDE), the conservation strategy defines zones as contiguous areas and buffers based on the bear population and habitat, not landownership. This means that private lands within the NCDE are still considered part of the Primary Conservation Area and Management Zone 1, subjecting them to mortality thresholds (see Section IV below). While mortality thresholds are in place and take is limited on these private lands, FWS and conservation groups like Defenders have worked proactively in these ecologically critical areas to ensure that private landowners have the tools and flexibility needed to address conflict. State and private lands inside the NCE are part of that ecosystem, and grizzly bear occupancy should be allowed on those lands.

We recommend that state and private lands within the NCE be considered part of Management Zone 1. Should the FWS decide to keep these lands as part of Management Zone 3 (or change it to Management Zone 2), we are extremely concerned that this would exacerbate the problem of private lands within the NCE becoming ecological sinks. This would make grizzlies more vulnerable to take and removal before they are securely established in the ecosystem. Also, the regulatory differences between Zone 1 and Zone 3 are significant, and regulating those discrepancies on state and private land in the NCE may prove difficult to enforce.

II. Take additional measures to secure attractants within the NEP Management Zones.

Attractants are one of the primary sources of human-bear conflicts. The Northern Continental Divide Ecosystem (NCDE) Conservation Strategy states that, "securing potential attractants is the single most effective way to prevent grizzly bears from becoming food conditioned and displaying subsequent unacceptable aggressive behavior. It is effective in limiting human-caused grizzly bear mortality, human-grizzly bear encounters, and other human-grizzly bear conflicts."¹⁴ Ideally, bear resistant food storage should be available and/or mandated on all public lands within the NEP Management Zones. Short of that, Defenders recommends the following actions:

II-A. Amend the Proposed 10(j) Rule to require that allowance of incidental take on Forest Service lands is conditioned on implementation of food storage restrictions in Zone 2 as well as Zone 1.

The Proposed 10(j) Rule conditions incidental take on Forest Service lands on implementation of food storage restrictions throughout Management Zone 1. Given the effectiveness of such measures, we urge the FWS to provide in the final Rule that allowance of incidental take of grizzly bears in a National Forest in Management Zone 2 is conditioned on the Forest Service's implementation of food storage restrictions throughout the Forest in which the take occurred.

Of the two national forests in the NCE, OWNF does not currently have a food storage order. This is a major concern for grizzly bears. A lack of food storage orders on public lands that reintroduced bears are likely to utilize poses a risk of human-bear conflict. The final Restoration Plan/EIS should call for OWNF, as soon as reasonably possible, to formally adopt a food storage order that mirrors the order in place at North Cascades National Park. Outside of the NCE, in Management Zone 2, only the Colville National Forest has a food storage order. The Gifford-Pinchot National Forest and Mt. Rainier National Park should also proactively work to adopt similar food storage orders rather than wait until grizzly bears arrive. Food storage orders can also provide benefits beyond grizzly bears by reducing human-wildlife conflicts with multiple species.

Defenders partnered with Colville National Forest, the Yellowstone to Yukon Conservation Initiative (Y2Y), the Interagency Grizzly Bear Committee and Scenic Canyons Recreation Services to fund the installation of 20 food storage lockers in 2021. We are prepared to assist with similar efforts in future.[15]

II-B. Budget and provide support for measures to secure attractants in gateway communities adjacent to Management Zones 1 and 2.

Most gateway communities listed in the Draft Plan/EIS, those cities and towns that are geographically close to the NCE, do not currently have the means to install bear resistant infrastructure for securing attractants, such as bear resistant garbage containers. This concern was raised by a member of the public during the Virtual Public Meeting on the Draft Plan/EIS and Proposed 10(j) Rule hosted by the agencies on October 17, 2023.[16] Agency representatives responded that this was not currently part of the plan, but numerous non-profits exist who are doing good work on this. While this is true, and such partnerships are very beneficial, this responsibility should not fall entirely on the public or non-profits to undertake. Additional funding sources, such as state and/or federal budgets, should be considered. Defenders stands ready to support efforts to secure such funding and to help inform best practices for such programs. As part of our bear coexistence programs in Washington, we have supported the installation of bear resistant garbage containers in the Methow Valley and with the Sauk-Suiattle Tribe. Recently, Defenders piloted an approach to make the city of Leavenworth a bear-resistant community, in partnership with the Washington Department of Fish and Wildlife (WDFW) and city officials.[17]

III. Clarify, monitor, and limit the conditions of preauthorized lethal take of grizzly bears.

As the Proposed 10(j) Rule recognizes, “excessive human-caused mortality is still currently the primary factor affecting grizzly bears at both the individual and ecosystem levels.”[18] Given this, it is important to ensure that the final Rule and Plan/EIS sufficiently limit mortality through unambiguous provisions that leave no room for misinterpretation. Accordingly, Defenders urges the agencies to clarify and strengthen the Proposed 10(j) Rule in the manners described below to limit the circumstances under which lethal take may be authorized.

III-A. Only authorized agencies, not private individuals, should be responsible for conducting lethal take in the NEP area, and FWS should maintain a careful oversight role.

Human lethal removal of bears is a procedure that should only be undertaken by trained professionals, except in emergency situations such as defense of life. Defenders appreciates that it is difficult for FWS to implement actions directly over a wide area; however, having untrained individuals kill grizzly bears could lead to dangerous interactions between people and wounded bears or cause accidents to others nearby. We therefore strongly advise against allowing private individuals to perform authorized lethal take in any NEP Management Zone.

Additionally, according to the Draft Plan/EIS, “the WDFW would manage grizzly bears outside the park, in cooperation with FWS.”[19] We understand this to mean that WDFW could be the authorized agency in deterring or removing bears that come into conflict with humans outside of national parks and Indian trust lands. Defenders has worked closely with WDFW on bear safety and coexistence initiatives in Washington for several years, and we have the utmost respect for the integrity and expertise of the staff we have worked with. It is worth noting, however, that WDFW's current leadership has engendered some public distrust in recent years over its handling of wolf and cougar conflicts in Washington state.[20] Wolves remain federally endangered across much of Washington state; any lack of proper due diligence in this area therefore does not bode well for grizzly bears. If WDFW is to be involved in grizzly bear management, we ask that FWS retain oversight of WDFW's decision-making processes as part of authorization provisions to ensure that all proper steps have been taken and non-lethal measures are not possible before lethal removal of a grizzly bear is considered.

III-B. Clarify that lethal take of a “grizzly bear involved in human conflict” cannot be based upon a grizzly bear's defensive behaviors.

The current definition of the term “grizzly bear involved in human conflict” in the Proposed Rule lacks the “(not defensive)” parenthetical qualifier, which should be added to the definition to clarify that it does not include defensive grizzly bear behaviors and ensure the definition is not misread. [21] Elsewhere in the Rule text, as well as in the Draft Plan/EIS, the term “aggressive” is consistently qualified with the parenthetical “(not

defensive)."

III-C. Eliminate potential ambiguities in the Proposed 10(j) Rule provisions regarding pre-authorization of lethal take in Management Zone 3.

Defenders is concerned with two areas in the Proposed 10(j) Rule in which the pre-authorization for lethal take in Management Zone 3 could be more clearly described. First, there is an inconsistency between the description of authorization for lethal take specific to Management Zone 3 in the preamble to the Rule and the Rule itself. The Rule allows FWS or an authorized agency to pre-authorize lethal take of any "grizzly bear that presents a demonstrable and ongoing threat to human safety or to lawfully present livestock, domestic animals, crops, beehives, or other property" if "it is not reasonably possible to otherwise eliminate the threat by live-capturing and releasing the grizzly bear unharmed."[22] By contrast, the preamble states that the agency could authorize lethal take only "when it is not reasonably possible to eliminate the threat through nonlethal means."[23]

The preamble's use of the term "nonlethal means" suggests that FWS intended to condition lethal take authorization in Management Zone 3 on an inability to resolve the threat via nonlethal deterrence, which is broader than relocation and includes other means of eliminating the threat.[24] Indeed, the proposed rule recognizes as much in describing conditions for pre-authorization of lethal take in Management Zones 1 and 2.[25] Given the importance of take limitations to recovery, we believe it is important to ensure lethal take is authorized only as a last resort. This is particularly true given the Proposed Rule's inclusion of private property within the NCE immediately adjacent to Management Zone 1 within Management Zone 3.

Second, the Proposed Rule's use of the undefined term "threat" regarding lethal take in Management Zone 3 introduces unnecessary ambiguity and could result in an expansion of the circumstances under which lethal take is authorized. FWS should set clear parameters for what constitutes a "threat," include the definition in the Rule, and ensure the parameters are understood by every authorized agency.

III-D. Clarify potentially confusing language concerning lethal take in Management Zone 2 in the preamble of the Proposed 10(j) Rule.

The preamble's shorthand description of conditioned lethal take related to livestock depredation is potentially confusing. It states that in Management Zone 2, the Service has the ability "to issue written time-limited conditioned lethal take authorization to a livestock owner if a depredation of livestock has been confirmed."[26] The Rule itself makes clear that additional constraints apply. Specifically, livestock owners may receive authorization to lethally take a grizzly bear following a confirmed depredation only if, within two weeks of the depredation, the bear is "within 100 yards (91 m) of legally present livestock" and "it is not reasonably possible to otherwise eliminate the threat by nonlethal deterrence or live capturing and releasing the grizzly bear unharmed in a remote area."[27] As noted above, Defenders maintains that only trained professionals should be engaged in lethal take of a grizzly bear. However, to the extent the final Rule allows livestock operators to engage in lethal take, and although the language of the Rule would control and eliminates any doubt, FWS should clarify this point in the preamble.

IV. Identify more specific demographic goals and set mortality limits for the NEP in the Draft Plan/EIS and the Proposed 10(j) Rule to ensure sustainable recovery for grizzly bears in the NCE.

Apart from a target population number (200) and age and sex criteria for bears selected for translocation, neither the Draft Plan/EIS nor the Rule currently state demographic goals for recovery. Per the 1997 North Cascades Grizzly Bear Recovery Chapter, the agencies must "determine population conditions at which the species is viable and self-sustaining [and] re-evaluate and refine population criteria as new information becomes available."[28]

For example, recovery criteria in the Cabinet-Yaak Ecosystem (CYE) described in the 1993 recovery plan stipulate that there should be 6 females with cubs over a running 6-year average inside the recovery zone or within 10 miles of its boundaries, excluding Canada, and that 18 of 22 BMUs are occupied by females with young from a running 6-year sum of verified sightings and evidence.[29] We recommend that the agencies develop similar recovery criteria for the North Cascades population based on the best available science.

The Draft Plan/EIS and the Rule should also include mortality thresholds for the NEP. While the Draft Plan/EIS estimates

that “approximately 2% of the grizzly bear population in the NCE would be lost to human-caused mortality each year, including mortalities associated with restoration activities,”[30] the Proposed 10(j) Rule does not contain any mortality thresholds to guide management decisions in the Management Zones. The 2% estimate is also nearly 20 years old. Because grizzlies are an extremely slow-to-reproduce species, most other grizzly bear ecosystems have mortality thresholds or goals that they work toward to ensure recovery. Again, the CYE recovery plan states that known human-caused mortality is not to exceed 4% of the population estimate based on the most recent 3-year sum of females with cubs and that human-caused mortality of females should not exceed 1.2% of the population estimate for a given year. These mortality limits cannot be exceeded during any 2 consecutive years for recovery to be achieved.[31]

While the Proposed 10(j) Rule allows the Service to translocate additional bears to achieve a founding population of 25 bears, the strategy of constantly augmenting new bears into the ecosystem is unsustainable, costly, and does not address on-the-ground threats. To achieve long-term recovery, FWS should commit to limiting mortality by defining thresholds in each NEP Management Zone. Permitted take should not exceed mortality limits. Should mortality thresholds be exceeded, FWS should reassess and further limit take allowances.

We recommend that FWS set a 0% target mortality threshold for the initial small population of 25 bears within Management Zone 1. Once the population grows, this can be reassessed. It is important to note that there is no evidence to suggest that a founding population of 25 bears will be large enough to lead to self-sustaining population growth. This concern is exacerbated by the exemption of take, which could significantly skew the population's demographic. Take of reproductive age females could severely restrict the population's ability to recover and even result in population decline. Without limiting mortality, FWS will likely need to translocate more than the 36 bears estimated in the Rule.[32] FWS has also not defined parameters for the population to be considered “established.”[33] Mortality thresholds in Management Zones 2 and 3 should be set as needed based on the biological needs of the species. If mortality is too high the population will not be able to establish itself, grow, expand, and ultimately, recover.

V. Develop a more detailed and comprehensive monitoring and evaluation plan with a specific timeline.

Per section NC4 of the North Cascades Ecosystem Recovery Plan Chapter (“Monitor population and habitat”), we recommend that the agencies expand the information contained in the Monitoring section on page 30 of the Draft Plan/EIS to include all likely population and habitat parameters that will be measured under the action alternatives, how each will be measured, and the timeline of these activities. The Plan/EIS and Rule should also include any monitoring obligations that FWS knows will be measured, how each will be measured, and the timeline of these activities.

The Draft Plan/EIS (appropriately) addresses how bears will be monitored during and immediately after initial translocations via GPS tracking collars and camera stations with hair snagging, but it contains less detail about long-term monitoring. This information is somewhat limited and spread throughout the document. The Monitoring and Evaluation section of the Proposed 10(j) Rule also offers information that could be incorporated into the Draft Plan/EIS, specifically the following paragraph:

“The FWS will monitor the status of grizzly bears in the NEP annually and will evaluate the status of grizzly bears in the NEP in conjunction with our species status assessments and status reviews of the grizzly bear. Evaluations in our status reviews will include, but not be limited to: a review of management issues; grizzly bear movements; demographic rates; causes of mortality; project costs; and progress toward establishing a self-sustaining population.”[34]

We understand that should either of the action alternatives move forward, monitoring and evaluation will be included in a follow-up implementation plan. Given that the implementation plan is unlikely to be open to public comment, however, we urge the agencies to include as much detail as is possible and allowable in the final EIS and final 10(j) Rule.

VI. Minor comments on the Draft Plan/EIS.

The following are minor suggestions and corrections we recommend to improve the clarity and quality of the Draft Plan/EIS.

VI-A. The paragraph beginning “In summary, grizzly bears released into the NCE are expected to have an opportunistic feeding strategy” on page 83 appears to be accidentally duplicated on page 84.

VI-B. The Proposed 10(j) Rule proposes to “use geographic location to identify members of the NEP. As such, any grizzly bear within the NEP area, regardless of origin, will be treated as part of the experimental population. Individual

grizzly bears dispersing into or out of the experimental population area will assume the status of grizzly bears within the geographic area in which they are found."[35] This is a helpful clarification that we recommend duplicating in the Draft Plan/EIS as well. This question has come up in public meetings, and members of the public are less likely to review the 10(j) rule than the Draft Plan/EIS.

VI-C. Accurate information about human-bear conflicts and living with bears is vital to promoting human acceptance of grizzlies in Washington, particularly given the safety concerns expressed by some residents in gateway communities. The Draft Plan/EIS makes a good start on communicating such information by including human bear conflict statistics from the Greater Yellowstone Ecosystem (GYE) on page 130. We recommend that more information of this kind be included in the final EIS and final 10(j) Rule as appropriate, and that a summarized version of it should be included in the Executive Summary section of the final EIS, where more members of the public are more likely to view it.

VI-D. The glossary of the Draft Plan/EIS includes a definition of "conditioned" that relates to the behavior of certain grizzly bears. However, the document contains numerous references to the term "conditioned lethal take" for which this definition is not applicable. The agencies may want to define this particular term in the glossary as well to reduce potential confusion.

VII. Minor comments on the Proposed 10(j) Rule

The Proposed 10(j) Rule fails to propose to amend 50 CFR § 17.84(l)(2)(iv), which provides that "a grizzly bear that is outside the [Bitterroot] Grizzly Bear Experimental Population Area identified in paragraph (l)(1) of this section will be considered as threatened." The Rule should amend this provision to include a reference to the North Cascades Grizzly Bear Experimental Population Area to avoid any potential confusion regarding the status of that population.

VIII. Conclusion

Nearly 30 years have elapsed since the publication of the NCE supplement to the Grizzly Bear Recovery plan. It is long past time for this iconic species to return to its full historic range in Washington State. Defenders remains committed to supporting FWS and NPS in making grizzly bear recovery in the NCE a reality with the implementation of the 10(j) Rule and Restoration Plan, incorporating the changes noted above. Defenders will continue our ongoing coexistence work to educate and provide tools to Washington's residents to live side by side with grizzly bears once more.

Correspondence: To whom it may concern,

I am writing as a concerned citizen, to support the restoration of grizzly bears to the North Cascades Ecosystem, their historic range for thousands of years!! Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations. They are keystone species responsible for the health of the ecosystem services we all rely on. Bears are the gardeners of the forest in more ways than one!

I support Alternative C but with needed changes to the proposed 10(j) rule. The proposal would bring up to 25 non-conflict grizzly bears - likely from Montana - into remote areas of the North Cascades over the next decade and manage them as an experimental population.

The proposed 10(j) rule as currently written fails to give grizzlies the best chance to succeed and is too permissible in allowing reintroduced bears to be killed??! This is the opposite of conservation!

Lethal removal of a grizzly bear should only be considered where there is a demonstrable threat to human safety, and, for non-immediate threats to human safety, only after non-lethal management options, including concerted use of conflict prevention methods, have been exhausted.

No grizzly bears should be hazed or relocated as a result of conflict with livestock unless demonstrable, repeated efforts have been made by the livestock producer to prevent such conflicts, using commonly-available techniques. No grizzly bears should be killed on public lands as a result of livestock depredation.

Landowners/private citizens should not be given a permit, or otherwise authorized, to kill a grizzly bear.

They are animals that share this earth with us, providing for the same nature that sustains us, we cannot fault or harm them for them simply following their nature, we have to be smarter.

No grizzly bear should be preemptively relocated if the bear is not a threat to human safety, particularly if the bear has not become habituated or food-conditioned, or when nonnatural foods/attractants have not been properly secured and made inaccessible to bears. Doing so acts as a disincentive for communities to employ conflict prevention measures, and increases the risk to the bear of injury or death from capture and relocation.

These changes are crucial in providing adequate protection for grizzly bears.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C and with appropriate changes to Section 10(j). Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Correspondence: I am writing to express my support for the National Park Service's decision to restore a grizzly bears to the North Cascades Ecosystem in Washington State, including to introduce additional bears to augment the small existing population. I support Alternative C in the EIS, with the accompanying 10j designation and rule as a good compromise that addresses public concerns.

I have lived in Skagit County for forty-five years and have camped and hiked all over the backcountry of the North Cascades. I have also had the privilege of hiking and camping in the interior west, and in Canada and Alaska, where grizzly bears still roam. I am not in the least bit concerned about sharing the North Cascade backcountry with grizzly bears. In fact, I consider it our responsibility to do everything we can to restore these magnificent animals to their rightful place in the wilderness within their historic range.

Thank you for your time and consideration, and for the opportunity to comment.

Correspondence: Recommend Alternative 'A' (No Action Plan)

Question: How does the National Park Service justify placing Grizzly bears onto public lands, next to communities, when their management policy states, "The safety and health of employees, contractors, volunteers, and the public are core Service values" ?

Question: How does the National Park Service justify placing Grizzly bears onto public lands, next to communities, when their management policy states, "Above all, keep in mind that the safeguarding of human life must not be compromised." ?

FACT: Grizzly bears will not remain in the National Park. They will expand their home range to include our communities.

FACT: The EIS fails to address the consequences resulting from Grizzly-to-human conflicts - human deaths and injuries.

FACT: In similar recovery zones THE MAJORITY of Grizzly-to-human conflicts (deaths & injuries) occur on private lands.

FACT: Previous Director of U.S. Fish and Wildlife Services stated before Congress that the Grizzly is biologically recovered.

FACT: Empty bear spray canisters have been found next to the dead bodies of those killed by Grizzlies.

FACT: Neither the Federal Government nor WDFW have an exit plan to withdraw the insertion of Grizzly bears into our communities once the Action Plan is executed.

FACT: National Park Service written policy states, "The safety and health of employees, contractors, volunteers, and the public are core Service values. Above all, keep in mind that the safeguarding of human life must not be compromised."

The decision being made to put Grizzly bears into our communities should be based on the merit of the facts. Unfortunately very few facts in the EIS have survived the "smell test" regarding their veracity. Instead, relevant information has been hidden from the EIS. The proponent agencies, NPS and FWS, have predisposed the narrative in the EIS to support their preferred action plan. In doing so the agencies have each committed violations under NEPA as well as under the CFR. This

will clearly be a political decision by those who are insulating themselves from the tragic deaths and injuries that will result from their decision - they have no conscience whatsoever.

Consequences of Grizzly bear attacks occurring just this year within a short 4-month period are listed below, followed by additional attacks in prior years. Our higher population centers bordering the NCE statistically will mean higher incidence of conflict especially as Grizzlies expand their range which is the proven case in Montana, Wyoming, Idaho.

Correspondence: I would like to see the grizzlies restored back to the Cascades. I also want our future generations to know we did everything in our power to restore a species we almost drove to extinction. I believe that with the current plan to reintroduce 3-7 bears within a 5-7 yr period would not prove to be a to rapid reintroduction rate. The Cascade mountain range is quite vast and there is plenty of high country for the bear to habitate. I think we have lived with the black and brown bear long enough to show they have not been to destructive to livestock and I believe the grizzlies would be about the same. They don't want to be around cities or a bunch of people anymore than the people want to be around them. As long as they are tagged and kept an eye on, I think it is beneficial to the environment.

Correspondence: Greetings from a long time backpacker. I have been camping/ hiking/backpacking since the mid 1960's. Normally I would have a resounding "Yes" for reintroducing an endangered animal, but not now and not for grizzlies. I think it would be a no win situation. These are my reasons. I have seen more and more people going out into the "wilderness, and not being educated in their contact with wildlife and or with the outdoors in general. So I see more possible confrontations between humans and grizzlies. Which could very well mean the loss of life for the human, but just as bad in my mind, is then that grizzly would have to be hunted down and killed. Not a good ending. Please do not reintroduce grizzlies to the North Cascades. Thank you

RE: Restoration of Grizzly Bears to North Cascades Ecosystem- Draft EIS

Dear Mr. Striker:

I strenuously object to the reintroduction of grizzly bears to the North Cascades Ecosystem complex (NCE) of WA. I have in the past had some experiences with grizzly bears - not all of them positive. For the reasons stated below, I recommend Agency adoption of ALTERNATIVE A -NO ACTION. Let me make one more candid comment - reintroduction is an incredibly stupid idea.

I hold a Masters Degree in Natural Resources and a Juris Doctorate in Law from very good natural resource and environmental law schools. I am a former employee of the US Fish and Wildlife Service (GS-11) out of Fort Collins, CO in the 1980's. I currently live in Washington and have spent considerable time in the North Cascades all the way south to I-90 on both the West and East sides, including segments of the Pacific Crest Trail. I have backpacked and hunted big game in the Greater Yellowstone Ecosystem, and the Northern Continental Divide Ecosystem over the last 30 years, often with friends or my family. I have also backpacked and fished on the Kenai Peninsula and mainland of Alaska. We have had numerous encounters with black bears and a few with grizzlies during this time, including one in Northern Yukon Territory, Canada, which was life threatening.

1. Human Population Growth in Study Area - Conflict Potential Greater Over Time.

Washington is one of the fastest growing states in the US. Many people use the mountainous areas of the NCE for outdoor recreation including hiking, backpacking and hunting. This includes people from out of state (often urban areas) who come to WA for the first time to hike and backpack our many trails, including the Pacific Crest Trail. This recreational usage has been increasing, and will assuredly increase over time. The NCE is not the vast area of the GYE, BE or the NCDE.

For roughly 6-8 months out of the year there are chances of encounters between humans and grizzly bears. I would suggest these possibilities of encounters would be on average greater than what might be experienced in many areas of the GYE. With more people and more bears there will be more conflicts, usually bad for the bears (we have already seen this happen with 10(j) wolf reintroduction in ID, MT and WY).

2. Grizzlies are not in danger of Extinction in the Continental US or AK. No more are needed to ensure species survival under the ESA. This is an attempt to shoehorn a new population into an area which has little to do with species survival. The 10(j) is just another ill advised legal excuse to put more bears in more areas with greater risk for human conflict.

3. Grizzlies will displace black bears already established in the NCE. This will likely reduce opportunities for recreationists to see black bears as the grizzly range and population grow, and will also reduce bear hunter opportunities, which likely Washington Department of Fish and Wildlife will not appreciate. Of course, black bears are easier for private parties to manage problem individuals - safely and within the bounds of the law.

4. Presence of an expanding population of grizzlies will reduce hunter opportunity of prey species. Grizzlies eat a lot. It must be anticipated they will take many young of the year ungulates. More prey individuals will be taken as more grizzlies are added thru natural reproduction or translocation. This adversely affects recruitment, and thus hunter opportunities to take mature deer and elk outside NCNP. Consider the wolf range and population is also increasing and competition will continue reduce hunter opportunity.

5. These grizzlies won't remain in the North Cascade remote areas. They will seek the lowland diverse ecosystems where seasonal prey are likely to be. Coincidentally these are the lands occupied by people. There will be conflicts, likely more than your EIS suggests. Then what? Expect to see them around Stehekin, Leavenworth, Mazama and other East side communities. This area will not respond like the GYE, and I seriously doubt agency scientists accounted for reduced suitable acreage for grizzlies in their carrying capacity modeling. If those areas occupied by humans and their road infrastructure (or anticipated to be occupied), areas of glaciated peaks, old growth timber and other habitat not suitable for prey species the area suitable for grizzlies is much reduced.

6. Once reintroduction starts it is likely more people will bring firearms to the area. Whether bears are broadly present in the North Cascades National Park, adjacent federal and state forest lands, the numbers of people with firearms will increase

substantially, outside normal big game hunting seasons. Human nature being what it is, this may also increase opportunities for these firearms to be discharged for recreation purposes during more months of the year, decreasing silence and solitude of the wilderness that many people seek to experience.

7. Many who support grizzly reintroduction have no experience with grizzlies. There are some/many who support reintroduction Alternatives have no experience in the wild, do not know of the potential impacts or dangers. Urbanites love their wilderness but many rarely go, so why should they weigh heavily in the reintroduction issue? This advocacy should be discounted in favor of people who live, work or try to make a living in and adjacent to areas the grizzlies are expected to occupy.

8. Grizzlies Often Get Into Trouble Requiring Lethal Removal. It is my understanding from authoritative sources that the GYE population of grizzlies which approaches 1,000 individuals, that roughly 5-10 percent of these bears, depending on the year, are involved in encounters of various types which result in mortality of the bears, and sometimes mortality and/or severe injury of humans, or destruction of property. Grizzlies will not stay in wilderness areas, they are opportunists and will seek out lowlands to find easy prey, often domestic stock or human food stores like chicken coops, livestock on the range or in enclosures, and graneries, damaging valuable private property. Livestock loss programs are an expensive joke in their daily administration - and a continuing frustration for those who attempt to make claims under these programs. One need only look at what has happened in ID, MT and WY already with the wolf programs. And USFWS has thus far balked at letting these states manage grizzly problems by maintaining ESA listing status. Even if the agency wanted to assist, advocates will endlessly sue to stop them. We have watched this bureaucratic disaster play out for over 30 years in the 10(j) wolf reintroduction to the GYE. WA should not have the same fate! Expect nuisance grizzlies to be killed illegally, and who can blame those who do it? Will railroad companies also be asked for money compensation for grizzlies killed by locomotives - ask BNSF or other railroad companies in the GYE if they like want more grizzlies in more places?

9. National Park Service and US Fish & Wildlife Service are Bullies

I deplore the advocacy by the US Fish and Wildlife Service, using the weight and influence of these agencies to aggressively push for this reintroduction. This strikes me more as internal agency bureaucratic advocacy than a demand by the public. JUST STOP!

My apologies for the brevity and incomplete nature of these comments, as I only learned of the expiration of the draft EIS comment period a day ago. Thank you for the opportunity to comment on this important proposal.

Sincerely,

Hi again. I am a local resident who has lived, worked, and recreated within the Recovery Area for over 50 years. Let me start off by saying that I strongly support Alternative A, but with the 10(j) rule attached for the time when bears do make their way into the North Cascades.

My primary concern is with the ability of the land management agencies to implement this recovery plan. While funding may be in place to capture and relocate bears into the NCE - what then?

My concerns, dating back to 2017, has been the lack of engagement of the US Forest Service in this process. With the NPS as a lead agency, and ¾ of the recovery area being on National Forests, it is still a case of the tail wagging the dog. The lack of coordination is striking. This was very apparent at the recent public meeting I attended in Darrington. While I appreciated that the National Park Service Superintendent, Mr. Striker, attended the meeting along with Fish and Wildlife Service officials, there was not a single uniformed Forest Service employee to be found. Similarly, the current DEIS has a list of 26 people involved in its preparation and does not include a single Forest Service employee. During the prior DEIS process there were two. I have spoken with district level staff who have extensive knowledge of their districts, and all have verified they were not asked for input on this process. As a result, The DEIS is deficient on activities related to recreation, timber, and other uses on the National Forests. For example, stock and equestrian use is barely mentioned and the fact that there are hundreds of miles of motorized and mountain bike trails on the National Forests and adjacent DNR lands. There are individual trails on public lands within the NCE outside of the North Cascades National Park where use is greater than that in the entire Park backcountry.

Due to current staff shortages, and possibly other issues, coordination between the two National Forests is also lacking. For example, Mt. Baker-Snoqualmie issued a temporary Forest Order earlier this year related to food storage. The Order was apparently done as an "Emergency Order" which will expire in 2025. The Okanogan-Wenatchee has not issued a companion order which will lead to public confusion particularly on trails such as the PCT which crisscross the border between the two Forests. Past orders were coordinated and signed by both Forest Supervisors. Public scoping prior to this regulation becoming permanent is required for the long term. There is no budget line in the DEIS that addresses this likely expensive item.

Future regulations that would require separation of camping, cooking, and food storage sites at backcountry camps - which currently number in the thousands - on the two national forests may have to expand to allow for these additional developments. Likely this would invoke NEPA and be further costs not accounted for. While this may not involve every campsite, there are still hundreds of heavily used camps that may need food storage infrastructure. With this level of development and de-facto campsite designation, the agency may be required to take further management actions such as identifying and removal of hazard trees. Again, more future costs.

The Forests currently have only a handful of employees who are able to enforce even the basic food storage regulation that the MBS has put in place. There are two officers for an area of 1.1 million acres on the Mt. Baker and Darrington Ranger Districts for example. They are only able to spend a very small percentage of their time on any trail, let alone deep in the backcountry. Education is a far more likely goal, though, you are more likely to run into a volunteer ranger in the backcountry than an actual employee - who would not have enforcement ability anyway. The budget should reflect a recurring need for at least seasonal backcountry rangers who, at a minimum, could educate visitors to be bear safe. These people would then be available to implement area/trail closures as needed. One seasonal for each 100,000 acres or so would be a start. About 20 annually for the National Forests.

The DEIS has a map displayed on several pages that outlines possible Grizzly Bear release areas. Two of these, the Pasayten and northern Glacier Peak sites, are not addressed in the DEIS. The Forest Service has not completed, or even started, a minimum requirements analysis to authorize motorized transport. More public scoping will be needed for this effort. The EIS should show these areas outside the National Park in some sort of provisional status. Staging areas D-G should be shown in a similar manner. This is another expensive project that is not accounted for in the DEIS.

Despite comments about the proposed flexibility of the 10(j) Rule, eventually there will be situations that result in closures of roads and trails of great value to recreation and other users. Projects may be shut down altogether. There have already been at least two trail reconstruction projects (Ridley and Swift Cr) dropped due to Grizzly Bear core habitat concerns on National Forest lands. Similarly, economic activities, such as timber harvest, may be impacted due to bears moving into, or near, a sale area for example.

The DEIS discusses plans the Canadians, along with the First Nations, are conducting to translocate bears into the Canadian portion of the NCE. Apparently, this plan is being developed in coordination with the F&WS. While I am in support of Alternative A, I do not have an issue with bears working their way south into the US portion of the recovery area. Another benefit of allowing this course of action to proceed is that in-migration of bears would not violate current Washington State law. These bears should be treated under the 10(j) rule.

In closing, I am supporting Alternative A with 10(j) for the following reasons:

- Lack of Forest Service leadership in this process
- Lack of funding for unidentified future costs
- Lack of addressing the diverse array of recreation activities, particularly impacts to equestrians and motor/mechanized use in the NRE.
- Lack of outlining the impact of future regulations
- Lack of an MRE on Forest Service land
- No demonstrated need on why this effort has to begin now.

Thank you once again for considering these comments.

Sincerely,

Correspondence: I'm typing this on my phone, so please excuse the inevitable typos. I studied conifer encroachment on subalpine meadows around Mt. Baker as part of my master's thesis. It's easy to see that it is absolutely prime bear habitat up there. They should be playing the role they've evolved to fill in that ecosystem. I know that as a hiker and climber, I will have to take more precautions when I visit the area in the future. I'm fine with that. It's not like it hasn't stopped me from visiting areas with grizzlies before. I'm really pleased that efforts to bring them back to the area are going forward. People can adapt to the inconvenience.

Correspondence: [In short, I wholeheartedly support steps being taken by the Federal Government to fully restore the North Cascades grizzly bear population using the 10J approach, and I believe that local public engagement needs to be geared up and ongoing in the way Wayne Kasworm did in the Cabinet Yaak ecosystem where he turned minds and hearts in favor of resoration by simply communicating often and honestly with locals.]

Thank you to the US Fish and Wildlife Service, the National Park Service, the USDA Forest Service, and the Washington Department of Fish and Wildlife for initiating this important process.

I emigrated to the USA in 1997. Part of the appeal of this amazing country is something that many people here take for granted - it's WILDNESS. When I hike the mountains of my native home in the UK, there is something missing. Grizzly bears have not walked those hills for one thousand years. And with them went all sense of wildness. The window of opportunity to restore some of our wild planet has long been closed in most parts of the world. But it is different in Washington State. Here, the window is still open, and it is a moment in time we should grasp with pride and excitement. The grizzly bear will sit atop a suite of majestic carnivores that STILL call this home - wolves, lynx, mountain lions, black bears, wolverine....

But it's clear that the tiny number of grizzly bears thought to exist in the North Cascades can't recover without active help in the form of augmentation. The history of this most successful and historically widespread of the bear species shows that with a little support, recovery should be not only possible, but widely beneficial in so many ways. Their ecological and cultural roles are clear, but their economic, and spiritual roles should also be considered. Our future depends upon the types of wild places that grizzly bears represent.

I've been fortunate enough to work on bear research, education, and conservation projects all over the world for the last 25 years. In 1994 and 1995 I captured, radio-collared and tracked grizzly bears by foot for 2000 miles over 2 seasons in the Canadian Rockies, learning from them as I went. I only saw a handful. Since then I've spent thousands of hours among grizzly bears in Alaska, and I've been lucky enough to escort some wonderful people to enjoy them first hand.

But my proudest work was here with the creation of the Grizzly Bear Outreach Project (now Western Wildlife Outreach). I co-founded GBOP in 2001 to bring an accurate understanding about grizzly bears and recovery to local communities of the North Cascades - in close partnership with state and federal agencies, and with the IGBC. But most importantly, with local community members. And wherever we go we find a very high level of support for grizzly bear recovery. Our rigorous polls tell us that local people think bears are an essential component of the North Cascades ecosystem (81% agree), that they were here before humans and have an inherent right to live here (76% agree), that they should be preserved for future generations (86% agree). 79% said they support recovery. The vast majority STRONGLY agreed with these statements.

It's unfortunate that the vocal minority opposed to grizzly bear recovery muddies the water with inaccuracies and myth - something that the grizzly bear has faced since the days of Lewis and Clark. The economics also speak for themselves. Studies in Yellowstone have shown that people flock to the place to see grizzly bears - they are THE prime reward. The presence of grizzly bears there results in 155 local jobs and \$10M per year injected into local communities. Research shows that people would pay even MORE than they already do to enter the park if they were guaranteed to see a griz.

My work as a TV host for PBS, BBC, National Geographic allows me the privilege of sharing the wonders of the wild with people, and the grizzly bear holds a special place in viewers' minds. Our films about them have held audiences of many millions captive all over the world. For good reason it seems. People find them irresistible and fascinating. In fact, it is VERY difficult for a reasonable person to argue that grizzly bears are a bad thing. The facts speak for themselves. But grizzly bears are wild animals, and CAN be dangerous - many people fear them for this reason. We should not shy from the truth, but merely place it in context, and treat people's opinions with respect and consideration.

I'm clearly an advocate for the wild, and for me the grizzly bear is the clearest manifestation of wilderness alive in the world today. But I'm also pragmatic and fair. Steps towards recovery have to be open, transparent, communicated well, inclusive, and with consideration for those who might be at first deny the benefits of bear recovery. Social science has proven that effective programs are based on fairness, familiarity, and control - when stakeholders feel that they are being treated fairly, have access to knowledge to increase familiarity, AND feel that they have a sense of control in matters, then much can be accomplished. Education and outreach should be given the highest possible priority as a result. Not just teaching passive audiences, but engaging active communities in the process - buy-in will be key, and will result in true benefits for all. Outreach can help stakeholders and communities move with the recovery process, checking off practical and emotional needs along the way like the need for information on safety and sanitation, ecology and behavior, and the recovery process itself. Time is on our side to do this right, and open communication is key.

But beyond the practical considerations, grizzly bears keep a part of us close to nature. They represent the things we all need - clean air, fresh water, intact natural resources. Like us, they are demanding - but they are also our best ally on a rapidly developing planet. The restoration of this unique grizzly bear population represents a golden opportunity for bears, for conservation, for our world. Let's show the rest of the world that this corner of the United States is ready to do something special, and huge for the natural world that we owe so much.

Whether we are ever lucky enough to see one or not, just knowing they are out there is a powerful tonic in a world that needs a little more nature. They teach us about ourselves, keep us humble, and are a part of our wild west heritage - perhaps THE most vivid part imaginable. If you don't believe me, just take a hike in the Scottish Highlands.

Correspondence: I'm not super educated on this topic but I do believe that it is the right thing to reintroduce grizzlies into the area. With that being said, it's equally important to educate the public on how to handle a potential encounter with grizzly bears. I also think it's important to understand to impact this could have on people living in the area from a structural perspective. Tons of construction would have to be done on things from trashcans to kitchens to ensure that they are "grizzly-proof";.

Correspondence: To whom it may concern,

I am writing in support of the restoration of grizzly bears to the North Cascades Ecosystem, their historic range for thousands

of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations. I have lived in Washington State since 1972, when I was a small child, and I would like Washington's wildlife and environment that I love so much to be afforded maximum protection in this age of the Sixth Extinction and global warming. The restoration of grizzlies to the North Cascades should clearly be part of these efforts.

I support Alternative C but with needed changes to the proposed 10(j) rule. The proposal would bring up to 25 non-conflict grizzly bears - likely from Montana - into remote areas of the North Cascades over the next decade and manage them as an experimental population.

The proposed 10(j) rule as currently written fails to give grizzlies the best chance to succeed and is too permissible in allowing reintroduced bears to be killed.

Lethal removal of a grizzly bear should only be considered where there is a demonstrable threat to human safety, and, for non-immediate threats to human safety, only after non-lethal management options, including concerted use of conflict prevention methods, have been exhausted.

No grizzly bears should be hazed or relocated as a result of conflict with livestock unless demonstrable, repeated efforts have been made by the livestock producer to prevent such conflicts, using commonly-available techniques.

No grizzly bears should be killed on public lands as a result of livestock depredation.

Landowners/private citizens should not be given a permit, or otherwise authorized, to kill a grizzly bear.

No grizzly bear should be preemptively relocated if the bear is not a threat to human safety, particularly if the bear has not become habituated or food-conditioned, or when nonnatural foods/attractants have not been properly secured and made inaccessible to bears. Doing so acts as a disincentive for communities to employ conflict prevention measures, and increases the risk to the bear of injury or death from capture and relocation.

These changes are crucial in providing adequate protection for grizzly bears.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C and with appropriate changes to Section 10(j). Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Correspondence: I am against the relocation of grizzly bear in our area which is north Pend Oreille county .Having lived her for 64 years and my ancestors living here well for over 100 years. Making there living working in the timber industry, ranching and farming and never had to worry about Grizzlies actually never even seen them as well as wolfs which have also been relocated here. We now have to continually worry about our safety and the safety of our livestock. I have always felt safe when out in the woods, but the past month my son has had a grizzly on his game cameras which makes us fear for the safety of our grandchildren. As we all know grizzly bear attacks are becoming more frequent. In Canada a couple that was very experienced were killed by a grizzly. I do not want it to happen here. Relocate in the wilderness areas where there are is enough habitat that they do not need to mix with humans, and livestock. I hope you will take it in consideration that we tax paying citizens should have say in the safety of our families as well as livestock. [REDACTED]

Correspondence: I support reintroducing wildlife that were extirpated in their native range. I support the agencies efforts, and think there are enough sideboards and options to manage individual bears if they should they become a problem. As a former wildlife viewing/flyfishing guide with firsthand experience in brown bear country, I know that most bears want very little to do with people. Most people recreating in the wilderness will not even come close to crossing paths with grizzlies, as most visitors to national parks hardly even leave the parking lot. There is a lot of fear mongering and inflated sense of risk with predators. I urge the agency to not cater to that false narrative, and stay true to your mission by doing what is best for the ecosystems in the north cascades. Thank you!

Correspondence: Sending this in support of Grizzly bear reintroduction. The biggest argument against seems to be fear, however Grizzlies have been here for the majority of time this area has been settled, without a single fatality. I hike regularly in the cascades, and have done multiple backpacking trips in the cascades. Bears attacks are way down the list of dangers, and hazards to prepare for. I am a forth generation whatcom county resident. Thank you, [REDACTED]

Correspondence: Please do not reintroduce the grizzly bear to new areas. Being from the s.e. Washington area I have followed the release of wolves , the success of the packs to watching news accounts of wolves being hunted and killed for live stock deaths. Our human expansion has destroyed what would be a natural habitat for the wolves and bears. Please don't bring them back to be hunted for their natural behaviors. Way to many people for the bears to thrive.. don't do it

Correspondence: I support bringing the grizzly back to the North Cascades. I have been a resident at the edge of the North Cascades and a frequent hiker in this National Park. Grizzly bears are part of our natural ecosystem, and the North Cascades is one of the few areas that has the habitat the grizzly needs to survive. Bringing the bears back will help complete this park in ways that will be beneficial to the environment, to other species, to the culture of the First People, and even to the tourist economy. National Parks are the place where wild species should be able to thrive. Please bring the grizzly back to the North Cascades.

Correspondence: Reintroducing grizzly bears that were native to the Cascades is part of a desperately needed move to restore and rebuild the area back to a healthy ecosystem. I would hope that technology, monitoring and other strategies can be used to protect the bears and humans and livestock from each other so that this can be successful and rewarding for us, the bears and the planet.

Correspondence: I am writing to express my strong support for grizzly bear restoration in the North Cascades. Grizzly bears once thrived in the North Cascades and are vital to maintaining a complete, ecologically-functional ecosystem. Grizzly bears enhance the backcountry experience and are an important part of our Northwest natural heritage, one that's on the brink of disappearing.

Specifically, I support Alternative C: Incremental Restoration. Alternative C strikes a sound balance to meet the mutual goals of grizzly bear restoration and the needs of people. I believe grizzly bears will benefit our region's ecosystems and economies alike, and preserve true wildness for future generations to cherish and enjoy.

Grizzly bear range in the contiguous U.S. has been reduced by 98 percent. Restoring grizzly bears to the Cascades will help to maintain the animal's distribution on the West Coast (the only Grizzly Bear Recovery Zone outside of the Rocky Mountains). We also know that people and grizzly bears coexist in other areas where the bears are much more abundant, and local economies are supported by tourism, backcountry recreation and ranching to name a few.

Grizzly bears won't recover on their own because the North Cascades is isolated from larger, more well-connected grizzly bear populations in the U.S. and Canada. In the decades since the grizzly was protected by the Endangered Species Act, grizzlies have not recovered in the North Cascades. Thus, the "No Action" alternative in the DEIS will not suffice to achieve grizzly bear recovery in the Cascades nor will it satisfy the objectives of the EIS process, the responsibilities of federal agencies under the ESA or the national strategy for recovering grizzly bears in the identified Grizzly Bear Recovery Zones.

During your scoping period, the 2017 DEIS comment period, and in recent public polling, broad support has been documented for grizzly bear restoration. Please do the right thing and bring back this native species through the strategy laid out in Alternative C. Alternative C strikes an acceptable balance between the biological and the social sciences. Grizzly bear restoration through Alternative C will restore an important piece of our ecosystem, regional culture and natural heritage.

Thank you,

██████████

Correspondence: To whom it may concern,

I am writing to support the restoration of grizzly bears to the North Cascades Ecosystem, their historic range for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C but with needed changes to the proposed 10(j) rule. The proposal would bring up to 25 non-conflict grizzly bears - likely from Montana - into remote areas of the North Cascades over the next decade and manage them as an experimental population.

The proposed 10(j) rule as currently written fails to give grizzlies the best chance to succeed and is too permissible in allowing reintroduced bears to be killed.

Lethal removal of a grizzly bear should only be considered where there is a demonstrable threat to human safety, and, for non-immediate threats to human safety, only after non-lethal management options, including concerted use of conflict prevention methods, have been exhausted.

No grizzly bears should be hazed or relocated as a result of conflict with livestock unless demonstrable, repeated efforts have been made by the livestock producer to prevent such conflicts, using commonly-available techniques.

No grizzly bears should be killed on public lands as a result of livestock depredation.

Landowners/private citizens should not be given a permit, or otherwise authorized, to kill a grizzly bear.

No grizzly bear should be preemptively relocated if the bear is not a threat to human safety, particularly if the bear has not become habituated or food-conditioned, or when nonnatural foods/attractants have not been properly secured and made inaccessible to bears. Doing so acts as a disincentive for communities to employ conflict prevention measures, and increases the risk to the bear of injury or death from capture and relocation.

These changes are crucial in providing adequate protection for grizzly bears.

Correspondence: IDraft Grizzly Bear Restoration Plan / Environmental Impact Statement, North Cascades Ecosystem

I support your plans to introduce Grizzly bears into wild areas including in the North Cascades in Washington state. I would like you to know that I hiked the entire Pacific Crest Trail in the summer of 2002. On that trek I carried a bear canister going through the bear areas approaching Yosemite National Park (from the south). I have also spend a total of over 16 months trekking to visit high Himalayan peaks.

Thank you,

Correspondence: I am commenting in support of the plan to reintroduce grizzly bears in the North Cascades. I believe that it is critical that we support the preservation of this species by establishing a population as proposed by the park service in the North Cascades. This is an area that has been demonstrated to offer habitat and food sources that will support a population of grizzlies. As a frequent backpacker, I am confident that I, and others using the backcountry, can take reasonable precautions to ensure our safety (should I ever be so lucky as to even see a grizzly bear). I am also someone who lives in a rural area where there theoretically could be encounters with a grizzly bear if they are reintroduced to this region. We already live in "bear country" and take reasonable precautions to avoid unduly attracting black bears so that they do not become problem bears -- precautions such as keeping poultry safe in a sturdy coop, refraining from putting up bird feeders, keeping garbage protected, etc. I do not expect we will need to take any additional precautions as a result of the introduction of the grizzly bears, but if there are additional steps we should take we view that as a small step that we would very willingly do in order to promote the health and well being of the grizzly bear population. I also specifically support the use of section 10(j) of the Endangered Species Act in order to provide local communities more flexibility to manage the grizzly bear population with additional wildlife management tools.

Correspondence: Thanks for asking for public input.

One of the most amazing experiences of my life was my visit in 2019 to Brooks Falls and the opportunities to see these magnificent animals in person. We were coached in how to behave to avoid unsafe encounters and there were no problems. Unfortunately, the trip to Brooks Falls is expensive and out of reach for many people.

We humans need to understand that everything is connected, as John Muir noticed. When you remove one species, the natural balance is out of whack and unimagined problems occur as a result. Please return the grizzlies. As we have seen in many areas with wolves returning, over time the natural balance of the area is restored.

Correspondence: I am not in favor of restoration of grizzly bears into NCES. I question the adequacy of the analysis of the information in the draft EIS & the proposed 10(j) rule. Since the last grizzly restoration attempt six years ago the main change in the area is that considerably more people live in this area specifically out further from the town's & cities. This makes human encounters with grizzly bears far more likely. National Park Service written policy states, "The safety & health of employees, contractors, volunteers, and the public are core Service values. Above all, keep in mind that the safeguarding of human life must not be compromised". Therefore my vote is option "A", no action on grizzly restoration in NCES at this time.

Correspondence: I have been exploring and recreating in the Washington State backcountry for over three decades: hiking, backpacking, climbing, wildlife tracking and more. I am an environmentalist and a longtime financial supporter of Conservation Northwest. Nevertheless, I am strongly opposed to both Action Plans B and C to reintroduce grizzly bears to the North Cascades Ecosystem (NCE).

The designation of introduced grizzlies as a Nonessential Experimental Population (NEP) acknowledges that they are not necessary to the survival of the species. So, then, the questions of their value to the ecosystem and to humans are paramount, i.e. "the restoration of biodiversity of the ecosystem to build ecological resilience and for the benefit and enjoyment of present and future generations of people" (second Purpose and Need bullet point).

The current EIS fails to present a convincing cost/benefit analysis that favors human intervention in the reintroduction of grizzlies. Specifically, I believe the EIS:

1. Grossly underestimates the potential for human/bear conflicts
2. Either discounts or ignores the adverse impact on backcountry users resulting from the presence of grizzly bears
3. Fails to fully consider possible changes in NCE visitor behavior, including increased user pressure on 'safe' areas and the proliferation of firearms in the backcountry
4. Fails to address compensation in cases of human injury or death

Detailed comments regarding each of these items follow.

1. Potential for Adverse Human/Bear Conflicts

There have been several grizzly bear attacks on people in recent years in both the United States and Canada, including multiple camper fatalities. The analysis of NCE visitation presented in the EIS and the potential for conflicts is woefully inadequate. Following are salient portions of the EIS (in quotes) and my comments:

"The park complex attracts more than 900,000 visitors per year, the majority of whom visit Ross Lake National Recreation Area (920,526 in 2020, 855,926 in 2021, and 998,019 in 2022)."

"For relative comparison purposes, Yellowstone National Park receives approximately 4 million visitors annually, while the North Cascades National Park Service Complex receives less than 1 million visitors annually, the majority of whom remain within the State Highway 20 corridor. However, only approximately 50,000 visitors used backcountry areas within the park complex. Given this level of visitation and the lower population density of grizzly bears, potential injuries and fatalities within the NCE are expected to be far lower than those presented for Yellowstone National Park during both the primary and adaptive management phases, all resulting in a decreased potential for grizzly bear and visitor interactions."

"In the event of a conflict between a member of the public and a grizzly bear resulting in human injury or fatality, adverse impacts on public safety would be substantial, and the impacts to the individual and their friends and family would be catastrophic. However, given the population size (ranging from 25 to 200) that would be present on the landscape, the availability of grizzly bear habitat, and the proactive measures and human-grizzly bear conflict response actions discussed above, the probability of such impacts occurring is considered minimal."

If 998,000 people visited the Ross Lake NRA in 2022, how can it be that fewer than 1 million visited the North Cascades National Park Service Complex? Due to the lack of park entrance gates, and limited visitor compliance with self-service registration, the actual number of visitors is likely much higher.

The comparison with Yellowstone fails to account for potentially significant differences in patterns of frontcountry vs. backcountry use. Yellowstone likely has a much higher proportion of frontcountry usage due to its national and worldwide popularity among visitors inexperienced in backcountry travel, while the NCE likely has a much higher proportion of highly-engaged backcountry users hailing from nearby coastal metro areas. As a longtime member of The Mountaineers and a regular backcountry visitor, I can attest to the popularity of many backcountry areas in the NCE. Despite the assertions in the EIS, it can be hard to find an 'untrammelled' place.

"According to the NPS, backcountry visitation in the park complex has fluctuated depending on the year; however, from 2021 to 2022, the park complex saw a 29% increase in backcountry campers" (p.111). The EIS also refers to "...pressures related to the region's rapidly growing human population". It doesn't address how these changes might affect future visitation patterns or adverse human/bear interactions.

The Pacific Crest Trail (PCT) and other popular destinations in the proposed Recovery Area 1 such as Maple Pass, Blue Lake, Harts Pass, Wolf Creek, and those around Stehikin, Marblemount, etc. often see very large numbers of visitors during the time when bears would be active and rearing their young.

The growth of communities in the urban/wildland interface near towns such as Mazama, Winthrop, Twisp, Chelan and Leavenworth will also increase the likelihood of adverse human/bear interactions. Human/bear conflicts are bad for humans and for bears. "As human population density increases, the frequency of encounters between humans and grizzly bears also increases, resulting in more human-caused grizzly bear mortalities because of a perceived or real threat to human life or property." (p. 5)

2. Adverse Impacts on Backcountry Users due to the Presence of Grizzly Bears

There is an underlying assumption in the EIS that the presence of grizzly bears in the NCE will "improve overall wilderness character quality over the long term" (p. 110). However, the potential degradation of human backcountry users' experience due to the presence of grizzlies is either discounted or ignored.

On p. 119, two studies from Glacier and Yellowstone N.P. are cited, ostensibly providing evidence that visitors want to see grizzly bears. What is not addressed is how many of these visitors would want to see grizzlies in their backcountry campsite or on a wilderness trail vs. from a safe vantage point. The EIS concedes that, "Impacts could be adverse for those visitors who do not wish to encounter grizzly bears, such as hunters processing a deer or elk carcass." (p. 119) This is a gross oversimplification that ignores the wider potential threat of bears attacking hikers or campers without such obvious attractants, which has occurred on multiple occasions in the U.S. and Canada in recent years.

I've had the privilege of backpacking in remote areas of Jasper and Yoho National Parks in British Columbia, Canada. While I relished the wilderness experience, I was unsettled by the thought of possibly encountering a grizzly bear. I had bear bells on my backpack and bear spray at the ready, but still felt woefully unprepared if I were to encounter a grizzly. I'm glad they exist and will continue to support their survival, but will probably avoid areas with significant grizzly populations in the future. To each their own space.

3. Possible Adverse Changes in NCE Visitor Opportunities & Behavior

This topic was very lightly touched upon in the EIC. There is no discussion of the potential for increased pressure and impacts on areas deemed 'bear safe', and very little on limited access to areas where grizzlies are present. The EIS presumes that there are extensive areas of undisturbed habitat where grizzly/human interactions will be very limited. My own experience of the NCE tells me that this is an unrealistic expectation.

Wild places that are already under pressure due to human visitation could be further degraded due their designation as 'bear safe' areas.

There is no discussion of how backcountry visitors might adapt to the presence of grizzlies, beyond waste management and learning aversion techniques. The reality in places where grizzlies are prevalent (e.g., SE Alaska), is that people must significantly curtail their backcountry travel and/or learn to use and carry firearms to protect themselves in case of attack. These possibilities are conveniently ignored in the EIS, but could become the norm in 60-100 years if a significant population of grizzlies is restored.

4. Cost vs. Benefit in Case of Human Injury or Death

While the EIS discusses potential compensation to livestock owners, it fails to straightforwardly address compensation in cases of human injury or death, and it completely avoids discussion of how much human loss would be worth restoring grizzly bears to the NCE. One human life in 25 years? Two maimed humans in 15 years? How much property loss?

CONCLUSION

The current EIS does not support either action Alternative B or C to restore grizzly bears in the NCE. Until the significant potential impacts I have raised are addressed, I support Alternative A - no action.

Correspondence: Grizzlies in the North Cascades: Can the environment support them and what is the true danger to the surrounding population?

The government has a duty and responsibility to ensure the safety of its citizens.

Any experiment that includes the release large apex predators in close proximity to large populations of people could be seen as being direct conflict of a government's basic duty.

The need to restore the grizzly population and the ability to succeed in the restoration of these large predators to the lower 48 states is not well articulated in this proposal. It is noted that there were some grizzlies in Washington in 1975, or almost 50 years ago, but this is not the same environment of 1975.

Many areas have been clear cut, streams dammed, and have salmon runs that have been faltering for many years. Elk herds are protected, but are they enough, with current deer populations, to truly support these apex predators? And do these predators have a right to return?

I support animal rights, but when the rights and safety of existing human populations are impacted, I believe there is a need to balance human safety with the actual need of a population of grizzlies that exists without issues in Alaska and Canada. There is little in this proposal that provides a solid need to expand this population into the United States. Nor are any benefits to this proposal well articulated.

The human safety analysis presented in this report is for a small population of bears with no large human settlements nearby in Selkirk. This is not analogous with the proposal of releasing Grizzlies into an area down to Snoqualmie Pass, a major recreation area.

A more balanced comparison may need to look at the Grizzly population in Glacier National Park or the greater Yellowstone area. A look at population of humans vs grizzly incidents over at least the past ten years would be needed to identify true risk to nearby cities and towns as well as visitors, in the North Cascades proposal.

The natural food supply of a population of large predators is also not well articulated in the report, and it is unclear if the bears would come to rely on nearby human habitations as sources of food. Further analysis is needed on food supplies with an exclusion of salmon(ids), as these are endangered as well.

The danger of these predators not having a food source and coming to rely on humans is not explored or addressed. This urgently needs to be investigated now and into the future before grizzlies are released in the area.

Most troubling, the southern border of the proposed area is Snoqualmie Pass, which is a summer and winter recreation area for tens of thousands of inhabitants of nearby cities, such as Seattle, Bellevue, Tacoma and a number of smaller cities and

municipalities.

The public should have some say as to how the public lands are used. Currently, the public can enjoy hiking, skiing, water recreation and camping with minimal fear of a large predator attack. With the introduction of grizzlies (Latin name: *ursus arctos horribilus*), the likelihood of human bear encounters increase. Grizzlies are aggressive and can be known to attack people with no known provocation as humans are prey for this species.

Protection is difficult as multiple recent reports of grizzly bear fatalities note that an empty can of bear spray was found near the remains, indicating bear spray is not an effective deterrent. It may be surmised that the only reliable protection from a grizzly is a firearm.

Hiking and camping with a gun could become an unfortunate reality should a reintroduction of grizzly bears occur in the North Cascades. This increases risk to other humans and animals in the vicinity.

If the habitat can truly support this species, we would expect a migration from nearby areas in Canada where bear populations are larger than in the US. There should be no need to introduce the animals, but migration and expansion, unimpeded, and perhaps with supports, would seem a more natural and organic reintroduction of this species if the area truly could support it. Again, there is no provided evidence that the area can provide adequate natural food supplies for these large apex predators.

The very high population growth of the Puget Sound area and the very high usage of public lands for recreation throughout Western Washington should give federal and state officials pause.

Reintroducing a very large predator into the surrounding wilderness is an idea that requires careful further analysis and extensive preparation to provide an environment that can support a large species without conflict with the existing human population.

Finally, with the unknown results of climate change, it is possible that the North Cascades will not be a suitable environment for grizzly bears in the years ahead.

Correspondence: Please DO NOT bring grizzlies into the North Cascades.
As an avid hiker, I would quit going into the out doors. Our salmon population is already struggling and the bears will not help the situation. Activists are urging people to quit eating salmon because our orcas are starving. I see thousands of cars in the Cascades at the trail heads on any given day. Most WA state hikers and climbers already know to avoid the mountains on the weekends due to the massive crowds.
It will just be a matter of time before one of these grizzlies kills someone and then also have to be killed. These bears are thriving in Alaska, Canada, Montana, Idaho, just to name a few places. There is no need to bring them here to help their population. This sounds like a disaster waiting to happen especially if they have to compete for resources amongst themselves and the wild cats. Please consider the people that do live in the small towns all through out the cascades. The bears will most certainly enter public areas and not just break into trash cans, they are capable of climbing into peoples homes.

Correspondence: Wdfw should not be introducing grizzly bears to our region. The department and state has clearly failed at introducing wolves and their ability to manage them, why would we want another dangerous predator here in our region. As if we don't already have a few around. Washington state is failing miserably at managing predators as clearly demonstrated. We live in a predator pit and all our ungulates have paid the price and are disappearing at an alarming rate. It's mind blowing to think Washington would even consider Introducing a predator like the grizzly knowing damn well we won't be able to manage them and the problems they will be causing with people and live stock not to mention public safety. These bears are not going to stay in the mountain ranges because the ungulate numbers are already depleted by wolves, cougar and black bear that are that are not being managed. These bears will end up in the lower elevations and valley where there are food sources and civilization.

For these reasons and many others I am against the reintroduction of the Grizzly bear.

Correspondence: To whom it may concern,

I am writing to support the restoration of grizzly bears to the North Cascades Ecosystem, their historic range for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C but with needed changes to the proposed 10(j) rule. The proposal would bring up to 25 non-conflict grizzly bears - likely from Montana - into remote areas of the North Cascades over the next decade and manage them as an experimental population.

The proposed 10(j) rule as currently written fails to give grizzlies the best chance to succeed and is too permissible in allowing reintroduced bears to be killed.

Lethal removal of a grizzly bear should only be considered where there is a demonstrable threat to human safety, and, for non-immediate threats to human safety, only after non-lethal management options, including concerted use of conflict prevention methods, have been exhausted.

No grizzly bears should be hazed or relocated as a result of conflict with livestock unless demonstrable, repeated efforts have been made by the livestock producer to prevent such conflicts, using commonly-available techniques.

No grizzly bears should be killed on public lands as a result of livestock depredation.

Landowners/private citizens should not be given a permit, or otherwise authorized, to kill a grizzly bear.

No grizzly bear should be preemptively relocated if the bear is not a threat to human safety, particularly if the bear has not become habituated or food-conditioned, or when nonnatural foods/attractants have not been properly secured and made inaccessible to bears. Doing so acts as a disincentive for communities to employ conflict prevention measures, and increases the risk to the bear of injury or death from capture and relocation.

These changes are crucial in providing adequate protection for grizzly bears.

Respectfully,

Correspondence: Dear USFWS and NPS:

Thank you for your extensive work planning the reintroduction of grizzly bears to the North Cascades. I support the reintroduction with an experimental population designation under section 10(j) of the ESA. My opinions are based on multiple perspectives, including as a wildlife biologist who once trapped and radio-collared grizzly bears (in the Selkirk Ecosystem, for Idaho Fish & Game and the USFWS), a human-carnivore coexistence specialist (in the Greater Yellowstone and Northern Continental Divide ecosystems), a rangeland scientist, and a former ranch manager.

This is an essential step towards the legal mandate to restore the grizzly bear throughout its range where feasible. The fundamental requirement of the ESA for delisting a species is that it no longer be threatened or endangered in a significant portion of its range. The grizzly bear remains extinct throughout the vast majority of its range in the contiguous U.S., and as such is unlikely to be delisted soon. The 1993 recovery plan was a good piece of work for its time; after three decades, we have two recovery zones with significant population growth, two recovery zones with little population growth, and two or three zones with no population at all (including the NCE). In that same three decades, we have a lot more science about grizzly bears, and a much better understanding of where bears could live (thanks in large part to federal scientists from the USFWS, NPS, USGS, and USFS). We need a recovery plan that adequately addresses recovery at the scale of the listed entity, i.e., the species in its historic range in the contiguous U.S., wherever feasible.

The NCE is one of two recovery zones where it has already been determined that grizzly bears should be reintroduced. The other is the Bitterroot Ecosystem.

In the long term the number of bears is less important than the number of human-bear conflicts. For delisting criteria, I caution against any language that might be construed to imply a maximum number of bears (e.g., 200). Recent analysis estimated the carrying capacity of the NCE might be about 280 bears. These numbers are sensitive to numerous factors, including where the boundary is drawn, and there will be bears that can survive outside of that boundary. We have seen social conflict in the Northern Rockies about the numbers of grizzly bears and wolves, concerns that are largely misplaced, but which are based in part on historic misperceptions about how many bears (or wolves) there would be.

In my experience working with livestock producers in Greater Yellowstone and the Northern Continental Divide, grizzly bears do kill cattle and sheep but the numbers are less than what one would expect. More importantly, there are strategies for reducing herd vulnerability, and tools for minimizing conflicts. For example I worked with ranchers on an allotment near the southern end of the GYE, on the Shoshone National Forest, where the permittees had lost a significant number of cattle to grizzly bears for at least three years; during the three years of our project, neither permittee had any confirmed losses. (We did this with range management methods: a strategic grazing management plan, applied by range riders using low-stress herding.)

In the long term, grizzly bears will require a different approach than traditional wildlife management. They will probably always be a conservation-reliant species in the greater NCE and may require occasional augmentation. I caution against any assumption that success necessarily means delisting and state management according to the North American Model. That Model has worked very well for ungulates, but poorly for carnivores, and especially poorly for grizzly bears.

Now, in the NCE, and in the BE, we have the opportunity to finally reintroduce the grizzly bear to long-identified portions of its historic range. Let's get to work.

Sincerely,

██████████

Correspondence: Dear Director Williams and Director Sams,

Below are 390 of 8,805 total comments submitted by advocates and supporters of the National Wildlife Federation Action Fund in regards to the Draft Grizzly Bear Restoration Plan/Environmental Impact Statement, North Cascades.

Thank you for releasing an environmental impact statement and draft plan that outlines a path forward to recover and restore grizzly bears in the North Cascades Ecosystem (NCE).

Grizzly bears belong in the North Cascades. They roamed the region for thousands of years and their eventual decline was a loss to biodiversity and to the cultural traditions of First Nations and Indigenous communities throughout the Pacific Northwest and British Columbia. Restoring and managing grizzlies in the North Cascades is an important step in bringing the full ecosystem back together and it's a critical step to larger grizzly bear recovery efforts in the lower 48.

I'm grateful for your leadership on this issue and encourage you to continue the recovery process in coordination with Tribal governments, local partners, and other stakeholders. Doing so will ensure that grizzly bears maintain a path towards full recovery for the benefit of future generations.

Sincerely,

RE: 2022 North Cascades Ecosystem Grizzly Bear Restoration Plan/Environmental Impact Statement and proposed 10(j) rule

Dear Mssrs. Striker and Morrison:

Chelan County has reviewed the draft Environmental Impact Statement and proposed 10(j) rule associated with the joint National Park Service and U.S. Fish and Wildlife Service Grizzly Bear Restoration Plan. We have previously provided extensive comments opposing grizzly bear reintroduction into our local communities. We continue to oppose grizzly bear reintroduction given the likely negative impacts to our rural communities. The federal agencies leading this effort continue to fail to adequately analyze and address these concerns in the current draft EIS and proposed 10(j) rule.

1. The draft EIS fails to analyze and consider impacts to local communities

Chelan County and other local governments within the North Cascades Ecosystem (NCE) requested Cooperating Agency status to participate in the development of the draft EIS and proposed 10(j) rule. Unfortunately, the National Park Service and U.S. Fish and Wildlife Service chose not to engage local governments and their expertise in the development of the draft EIS and proposed 10(j) rule. Notably, the draft EIS does not adequately analyze or consider impacts to local communities within the NCE, including public safety, economic development, recreation opportunities and overall livelihood of rural communities. Counties, in particular, have special expertise and jurisdiction in land use planning, economic development, parks and recreation and road development and management that should be incorporated into the draft EIS and proposed 10(j) rule. We, again, request Cooperating Agency status and that completion of the draft EIS be delayed until the potential impacts to local communities are better analyzed and understood.

2. New and emerging information must be considered and incorporated into the draft EIS and proposed 10(j) rule

We learned from the October 2023 Interagency Grizzly Bear Task Force that extensive modeling is being completed by the U.S. Geological Survey to predict NCE grizzly bear habitat use, and the current modeling, described by USGS scientists as "highly predictive," shows high-value grizzly bear habitat well outside the proposed release areas identified in the draft EIS. We do not purport to be experts in wildlife biology, but the preliminary results of the modelling appear to point to obvious areas of potential conflicts between grizzly bears and local communities. Significant blocks of these high-value grizzly bear habitat areas are located outside the North Cascades National Park and designated wilderness areas and squarely within non-wilderness lands managed by the US Forest Service and private property. The current draft EIS and proposed 10(j) rule must be delayed to allow for the USGS modelling effort to be completed, incorporated into a new draft EIS and shared with the public.

= Large blocks of Predicted Grizzly Bear Habitat. Adapted from Sells and Costello (draft). Polygons created by Chelan County.

= Potential Grizzly Bear Release Areas (approximate). Adapted from draft EIS. Polygons created by Chelan County.

3. The role of the Okanogan Wenatchee National Forest in grizzly bear reintroduction must be fully analyzed and incorporated into the draft EIS.

Grizzly bear reintroduction appears to rely heavily on actions that will take place on the Okanogan Wenatchee National Forest (OWNF), yet OWNF is not participating in the development of the draft EIS or proposed 10(j) rule. The draft EIS can not be based on assumptions about future OWNF policies and actions and must identify, analyze and incorporate those issues now. We are particularly concerned that the draft EIS does not consider impacts to much-needed forest health treatments, road building and recreation, especially "high-use" roads and trails. It is unclear to us if there is sufficient "core area" within the NCE to support grizzly bear reintroduction given the recreational uses on the OWNF. Given the increase in size and scale of wildfires, the need for forest health treatments and road building to support those treatments is paramount for ecological and community needs and would likely be significantly constrained by grizzly bear protections.

4. Grizzly bear reintroduction and management must be re-considered in light of draft EIS deficiencies

The current proposed 10(j) and 4(d) rules need to be re-considered after the draft EIS deficiencies are addressed. It appears that the NCE does not provide sufficient habitat to support grizzly bear reintroduction population goals and that substantial preferred habitat is located on the OWNF and rural communities. Given the high level of activity in these non-wilderness areas, 10(j) and 4(d) provisions must be re-considered and expanded to anticipate and address significant conflicts between grizzly bears, local communities, forest practices and recreational activities. Conversely, the feasibility of grizzly bear reintroduction must be reconsidered given these likely conflicts.

We reiterate our opposition to grizzly bear reintroduction given the likely adverse impacts to our local communities and lack of local government engagement by the federal agencies. At

minimum, we hope that you will consider our comments and develop a draft EIS and proposed 10(j) rule that more accurately reflect the current science, management needs and local community impacts of grizzly bear reintroduction.

Sincerely,

██████████

Correspondence: I do not support the reintroduction of grizzlies into the North Cascades. I grew up in and still live in Ferndale, Washington, near the North Cascades, and spend time hiking in the North Cascades every year. I've been on several multi day backpacking trips.

The benefit to the environment would be negligible because we already have a lot of black bears. What would the actual, concrete benefit of grizzlies being introduced? The impact statement mentions the abstract and insubstantial 'cultural heritage'.

The drawbacks will be real. The impact statement fails to acknowledge the danger of grizzlies. It mentions 'injuries' but completely and disingenuously ignores fatalities. Over 10 people have been killed in the US and Canada in the last three years by grizzlies. (https://en.wikipedia.org/wiki/List_of_fatal_bear_attacks_in_North_America). Over 30 dead since 2000.

While the risk is very small for an individual trip, eventually someone will be attacked and killed by a grizzly in the North Cascades if they are reintroduced. What will be the justification for their death? That someone wanted to improve the 'cultural heritage' of nature?

The impact statement claims there won't be long term closures like yellowstone because prey concentrations haven't been observed. But of course that analysis can change, so it seems like there's a risk of closures as well. And even short term closures of a day will ruin a hike for people if they can't go on the hike they planned. And it will ruin the experience for hikers if they planned a big hike and took time off of work for a trip that gets completely canceled due to a grizzly.

Hiking will become more expensive, and thus more exclusionary to traditionally marginalized people as well, due to required and recommended safety equipment.

Again, for what?

Perhaps the people eager to experience grizzlies in the wild can travel to one of the areas in North America where they already roam without putting North Cascades hikers at risk.

Thanks,

██████████

Correspondence: To whom it may concern,

I am writing to support the restoration of grizzly bears to the North Cascades Ecosystem, their historic range for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C but with needed changes to the proposed 10(j) rule. The proposal would bring up to 25 non-conflict grizzly bears - likely from Montana - into remote areas of the North Cascades over the next decade and manage them as an experimental population.

The proposed 10(j) rule as currently written fails to give grizzlies the best chance to succeed and is too permissible in allowing reintroduced bears to be killed.

Lethal removal of a grizzly bear should only be considered where there is a demonstrable threat to human safety, and, for non-immediate threats to human safety, only after non-lethal management options, including concerted use of conflict prevention methods, have been exhausted.

No grizzly bears should be hazed or relocated as a result of conflict with livestock unless demonstrable, repeated efforts have been made by the livestock producer to prevent such conflicts, using commonly-available techniques.

No grizzly bears should be killed on public lands as a result of livestock depredation.

Landowners/private citizens should not be given a permit, or otherwise authorized, to kill a grizzly bear.

No grizzly bear should be preemptively relocated if the bear is not a threat to human safety, particularly if the bear has not become habituated or food-conditioned, or when nonnatural foods/attractants have not been properly secured and made inaccessible to bears. Doing so acts as a disincentive for communities to employ conflict prevention measures, and increases the risk to the bear of injury or death from capture and relocation.

These changes are crucial in providing adequate protection for grizzly bears.

Correspondence: I am against the reintegration of grizzly bears into the northern Cascades. I have three young children, and we hike, camp, and visit the north cascades as often as we are able. The threat of grizzly bears in the area would make it very difficult to feel like a good father and putting my children near such an animal. Especially considering the two people in Canada that were just killed by a grizzly, and they even used bear spray. The environmental impact would be negative as well. They are a predator, and the area already has a low elk population that has required unit 418 to be special permit. Grizzly bears will only lower the population of existing animals, and will undoubtedly at some point take human lives as well.

Correspondence: Comment letter re: NPS/USFWS Draft Grizzly Bear Recovery Plan/EIS for the North Cascades Ecosystem

November 13, 2023

Dear Superintendent Don Striker and Supervisor Brad Thompson,

The Washington Chapter of the Wildlife Society writes to support further research and conversation about the possible restoration of a healthy population of grizzly bears to the North Cascades. We appreciate the efforts being made to reintroduce grizzly bears to their historical range, but would like to emphasize the importance of stakeholder engagement. At this moment, the chapter is not opposed to or in support of the reintroduction; we simply are hoping that the NPS and USFWS will continue to do their due diligence by researching and discussing this idea with all stakeholders before moving forward.

It is evident that the reintroduction of grizzly bears is a complex and controversial issue, and understanding the various stakeholder perspectives is crucial for a successful reintroduction effort. A comprehensive stakeholder conflict assessment should be conducted which includes the perspectives of local communities, conservation organizations, hunters, ranchers, and indigenous communities. By developing a platform for constructive dialogue, stakeholders have a chance to reach shared understandings and identify specific points of contention such as human-bear conflicts, land use, and economic impacts. We recommend considering replicating the example set by the Washington Wolf Advisory Group, and organizing cross-state dialogue opportunities with ranching communities in Montana and other entities in Montana that have been key to co-existence success there such as the Centennial Valley Association and the Blackfoot Challenge. Establishing common ground and mutual learning serves as a foundation for shared values to emerge.

We believe that addressing stakeholder concerns and finding shared values will enhance the likelihood of a successful grizzly bear reintroduction program. By actively engaging with all parties involved and considering their concerns and perspectives, a more inclusive and durable plan can be implemented.

Thank you for considering our comments. We look forward to the continued progress of this important initiative and hope to

see a harmonious and successful reintroduction of grizzly bears into their historic habitat.

The Wildlife Society's Position Statement on The U.S. Endangered Species Act states that the Society's policy is to "Assure that decisions under the ESA are transparent, replicable, and based on robust analyses of the best scientific data available." (TWS 2017)

Sincerely,
The Washington Chapter of the Wildlife Society

Correspondence: I've written once before about having hiked and bikepacked extensively throughout US and Canadian territories through grizzly country, and how the sheer preposterous of the idea of reintroduction of grizzlies to the North Cascades is foolhardy at best and will result in deaths of both humans and bears. But I'd like to now comment against one of the "pros", specifically how their reintroduction will result:

"Contribute to the restoration and biodiversity of the ecosystem".

How in the world does having grizzlies in the North Cascades contribute a positive factor to the "ecosystem"? What, specifically, is out of balance due to their absence?

I would also ask, "In the North Cascades, how many humans have died in the last fifty year due to a grizzly bear encounter? It's pretty obvious the answer is zero.

When the question is switched to, "How many people in the US have died in the last TWO YEARS due to grizzly bear attacks?" The answer is "Between 2020 to 2022, there were eight fatal grizzly bear attacks in North America." By reintroducing grizzly bears to the North Cascades you would only be INCREASING that number. Furthermore, I would say that deaths, resulting from the reintroduction of the species, would be specifically the fault of this panel.

Regards,

Correspondence: I have been around grizzly (brown) bears more than anyone I know. I see a lot of people commenting out of ignorance and fear about something of which they have little knowledge. National Parks and wilderness should be managed to be in their "natural state". This includes the bears that used to roam these special places. I saw a Grizzly with my son and his friend at Monogram Lake in 1990. I saw one in Yellowstone August 10 and another on August 12 of this year. I have seen, and shared space with countless grizzlies in the Situk and Kenai watersheds in Alaska. Yes, just as you need hiking skills and knowledge to venture into the backcountry, in Grizzly country you need to know the rules and pay attention to what you are doing. These rules can be learned in five minutes by anyone. These are basically shy creatures who will avoid humans if you give them a chance. They can be managed, and if they cause trouble with ranchers or farmers, killed, and the ranchers compensated. But seeing a grizzly in the wild is an awe-inspiring and magical experience. People who say they will drastically reduce huntable deer populations would do better to slow down at twilight and watch the freaking road. Dozens upon dozens are killed by irresponsible motorists in the stretch of road near my Winthrop house. Give the bears a break, let go of uneducated fear, and return the North Cascades back to their natural state.

Correspondence: I want to express my support for re-introducing Grizzlies to the North Cascades in order to re-establish their historical range, assist with their conservation, and maintain a healthy and functioning ecosystem. I also love the natural beauty and wildness that exist in this part of our country, and support the idea of establishing Grizzlies here to further distinguish the North Cascades as one of the most wild and beautiful places in our great country. I acknowledged that I do not currently live in the Pacific Northwest (but I expect to later in my life) and those who currently live locally may have concerns, particularly related to safety. But, humans and bears can safely coexist in a healthy ecosystem together for both our benefit. Bring back the bears!

Correspondence: Bears as predators are important components in regulating a healthy ecosystem. This is a good plan that undoes some of the early damage from overzealous hunting and habitat loss earlier in the century and is long overdue. I support the proposal to repopulate certain isolated areas of the Pacific Northwest with a native bear population.

Concerns from farmers are not valid as the USDA already has a system in place to compensate them for predation livestock loss.

Correspondence: I do not support reintroducing the grizzly bear into the North Cascades, or anywhere in WA. Grizzly bear populations are prospering in all of the neighboring territories such as Canada, Idaho, Montana, and Wyoming. They will naturally migrate as habitat allows. There is no need to spend already limited resources to expedite something that will happen naturally if habitat can sustain it. In addition to this, the current wildlife commission has clearly demonstrated they are not capable of effectively managing the existing predator populations such as wolves, bears, and cougars. Until there is sustained improvement in this area there should not be any additional introductions that would strain this even more. As I tell my children, you earn respect and trust, and the only way you do that is by your actions and results. The wildlife commission has zero results in demonstrating effective predator management and is therefore in no position to even consider adding to that problem.

Correspondence: As an avid hiker in the Cascades and raised on an Eastern Washington cattle ranch in the foothills of the Cascades, I support the re- introduction of grizzly bears into the Cascade Range. This number if introduced, will have a very limited exposure to those pursuing recreational activities in the mountains but help support the ecosystem and diversity of the Northern Cascades. These are incredibly magnificent animals which we've lost in the Cascades and almost lost elsewhere. I've only encountered grizzlies twice in the wild viewing at a great distance in Montana, they are worth the effort in bringing them back to the North Cascades. As with other wild animals currently living in the mountains that pose limited risks to humans, education and placement are key. Education and monitoring efforts have greatly improved over the years to reduce the risks of human encounters with the bears. It's time we welcome them back to the Cascades. Thank you for this opportunity to provide my comment.

Correspondence: I am writing to support the restoration of grizzly bears to the North Cascades Ecosystem, their historic range for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C but with needed changes to the proposed 10(j) rule. The proposal would bring up to 25 non-conflict grizzly bears - likely from Montana - into remote areas of the North Cascades over the next decade and manage them as an experimental population.

The proposed 10(j) rule as currently written fails to give grizzlies the best chance to succeed and is too permissible in allowing reintroduced bears to be killed.

Lethal removal of a grizzly bear should only be considered where there is a demonstrable threat to human safety, and only after non-lethal management options, including concerted use of conflict prevention methods, have been exhausted.

No grizzly bears should be hazed or relocated as a result of conflict with livestock unless demonstrable, repeated efforts have been made by the livestock producer to prevent such conflicts, using commonly-available techniques.

No grizzly bears should be killed on public lands as a result of livestock depredation.

Landowners/private citizens should not be given a permit, or otherwise authorized, to kill a grizzly bear.

No grizzly bear should be preemptively relocated if the bear is not a threat to human safety, particularly if the bear has not become habituated or food-conditioned, or when non-natural foods/attractants have not been properly secured and made inaccessible to bears.

These changes are crucial in providing adequate protection for grizzly bears.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C and with appropriate changes to Section 10(j). Thank you.

Correspondence: The north cascades have been without grizzlies for about a century or more. Nature has balanced this ecosystem in the absence of this predator. The prey species in this area have no experience with Grizzlies. Grizzlies have not migrated into this area despite being connected to areas that hold sufficient Grizzly populations. We should closely examine why. It has apparently been studied and is suggested to be adequate for Grizzly population but again there have not been Grizzly migration into the area. We see repeatedly that nature balances what humans can not. Nature has not balanced Grizzlies into this area.

If humans reintroduce Grizzlies into this area the new bears will strain this ecosystem and the prey species there. Grizzlies will strain the predator species there. There will be grizzly interactions with humans. Why must humans be so arrogant to try to rebalance what nature has balanced. Grizzlies will introduce new death, destruction because of human hubris. Nature will balance our arrogance with loss of life. When that loss becomes a human loss this reintroduction will be at fault. Nature will not be at fault. Those that choose to push reintroduction will be at fault.

Correspondence: Comment on: Draft Grizzly Bear Restoration Plan/Environmental Impact Statement--North Cascades Ecosystem 2023

I endorse Alternative C in the EIS for reintroducing grizzly bears to the North Cascades. The plan is sound, incremental, and the 10(j) designation will allow sufficient management flexibility to address issues that arise with wandering bears and possible conflicts

I lived in Montana for 4 years in the 70s and then for 42 years in Alaska, where I worked as a wildlife biologist all over the state on a variety of birds and mammals. My interactions with brown (coastal) and grizzly bears (interior) gave me admiration and respect for what I would call the sentinel species of wilderness. Without grizzly bears in their native habitat, wilderness is not wilderness.

I moved to the east slope of the Cascades (Winthrop) in 2020 and one of my regrets was that I left Alaska for a place where the wilderness was incomplete; it was missing the eminent species historically present in this ecosystem. Grizzlies had been extirpated in the 1990s and the North Cascades were seemingly isolated from other viable grizzly populations. Their absence is a giant hole in the wilderness landscape and fauna. The grizzly is a cultural icon for those who wander the backcountry in search of "wildness."

Briefly I will address the issue of conflicts with grizzly bears. Yes, they are scary, yes, they can inflict damage, and yes, they occasionally go rogue. But so do black bears, and so do cougars and wolves. People in Washington seem to accept these other species (wolves are re-establishing themselves and it is unclear to me how the locals feel about that) without a great deal of fear and antipathy. My observation is that people can adapt to wildlife, whether it is deer in your garden, coyotes in your chicken house, or bears in your bird feeders. The Alaska Department of Fish and Game has radio-collared black and grizzly bears in the Anchorage city limits and shown a startling number of bears that mostly go unseen and unnoticed within the city and suburb limits, until a bear gets into garbage (usually a black bear) and must be deterred or moved. Bears are for the most part wary and secretive, they do not seek out people or their residences or their domestic animals. In the 40 years I spent in Fairbanks, I don't recall any fatalities from grizzly bears in Anchorage or Fairbanks; there were several maulings, bears sometimes got into garbage that wasn't contained, and a few bears were shot by people who feared attack. This is amazing for two urban areas comprising 400,000-500,000 people. The numbers of such incidents pale in comparison with the number of people hurt or killed in car accidents, drug overdoses, or violent crime. The threat of grizzly bears is psychological and not supported by the frequency of negative encounters.

The North Cascades Ecosystem as defined in the EIS is larger than the Yellowstone Ecosystem and the Continental Divide Ecosystem, both of which support viable populations of grizzly bears. Habitats among these areas are similar; they are interior regions without substantial salmon or other fish runs, where bears will subsist on vegetation, berries, insects, carrion, occasional young ungulates in spring, and ground squirrels. The same is true for interior grizzly bears in Alaska and Canada. There is more than enough quality habitat to support 200 grizzly bears, and that aspirational population level would not be reached for 60-100 years (based on population growth estimates provided in the EIS). It is highly unlikely that conflicts will arise from the initial population of 25 bears, or the 5-7 bears introduced each year. In fact, we will be hard pressed to observe a bear in the wild for many years after re-introduction.

Establishment of a population of grizzly bears in the North Cascades will increase the resiliency of grizzly bears in North America and thus allow recovery and removal from the Endangered Species List. They will help bolster bears on the north side of the Canadian border (where they could disperse) and will add another population in the western region they once inhabited. This new population will potentially increase genetic diversity and serve as a source of immigration to other areas or source of bears for future transplants. All will help increase the viability of grizzly bears in the Northwest and Canadian border area. Re-introducing bears in small numbers over a small number of years (3-7 years) will allow the seed population to adapt to its new ecosystem and slowly grow with a minimum of human encounters. Bears that don't survive the translocation can be replaced as needed to ensure a seed population of 25 potential breeding bears is achieved. This approach has been successful in other areas, such as the Cabinet Yaak Ecosystem.

The 10(j) designation is critical to the success of the restoration effort in an area where people are not accustomed to grizzlies. It will allow managers and others to move or dispatch bears that have become problems. The ability to manage problem bears should decrease the fear and resistance to the establishment of grizzlies in the North Cascades.

Should this re-introduction not proceed, grizzlies are unlikely to re-inhabit the North Cascades on their own. What is the purpose of the Recovery Plan and the Endangered Species Act if we don't make a serious effort to re-establish this species where it once roamed? Alternative C is a good faith effort to fulfill the intent of the Endangered Species Act and the Recovery Plan.

To summarize:

1. Grizzly bears have a long history in the North Cascades before hunted to extirpation, therefore they were well-adapted to the ecosystem and a key part of the local ecology.
2. The North Cascades ecosystem is large (~10,000 sq. miles) and diverse, larger than the Greater Yellowstone or North Continental Divide ecosystems, therefore it has more than enough habitat for more than 200 bears and would allow sufficient uninhabited areas without human interference. Thus, the plan area would have a high likelihood for successful re-introduction.
3. Grizzly bears are a sentinel species highly valued by indigenous cultures and people who appreciate "true" wilderness.
4. Grizzly bears are a minor threat to humans and domestic animals; people have learned to live peacefully with grizzly bears throughout Alaska, western Canada, and parts of Montana; with a little education, people can do the same in the North Cascades.
5. The plan for re-introduction is incremental and will require 60 to 100 years to reach its population goal; the slow introduction and population growth will allow people to adapt to grizzlies and manage any conflicts that arise.
6. The 10(j) rule, for an experimental or non-essential population, will allow more management options for dealing with problem bears or human bear conflicts; management flexibility is essential to gain public approval and reduce fears of bears.
7. Alternative C has the highest probability to successfully recover grizzly bears in the North Cascades Ecosystem to a self-sustaining population in keeping with the intent of the Endangered Species Act.

Correspondence: Hello,

I find it interesting first that this initiative which has apparently been proposed a number of times since the late 1990's is being resurrected after being stopped most recently in 2017.

I object to this plan. It as near as I can tell is promoted by people who do NOT live or make their livelihood in the specific or nearby areas.

I find the use of historical population of Grizzly bears as the reason for bringing these bears to the area to be specious at best. Perhaps the presence of other wildlife could be studied with a similar time frame and establish the "seeding" of wolves, coyotes and other animals in the King, Snohomish and Pierce County areas.

In a more, current example I note a recent article in Bloomberg news by David Dudley ddudley23@bloomberg.net pointing out the many issues with both Black and Grizzly bears in Missoula MT a small/medium city not terribly near to Yellowstone National Park but apparently dealing with ongoing problems with bears coming into residential areas because of the ready food source (garbage) when other normal food sources are scarce.

This problem has apparently fallen to the city to solve with "bear proof" trash containers for residential and commercial areas. And other special suggestions on how to handle trash.

I know from a Yellowstone Park Ranger that Grizzly bears are omnivores, whose preferred food is some sort of cone or other vegetation. However, in this same talk it was explained that we could not go on our trail walk and talk by Yellowstone Lake because the wolves had taken a bison down and the grizzlies had picked up the scent and were in the process of 'sharing' the carcass with the wolves. A natural process in Yellowstone and cause for caution by tourists to a wild area,

The human population of the North Cascades has increased a great deal since they were naturally occurring in some quality here.. The bears are able to range over a large area and if they had an interest in the North Cascades, they could have (and may have) migrated to the area. I doubt there is complete information about this. I have no interest in trying to, after the fact, solve problems with grizzlies being added and then moving in search of food to populated areas as well as agricultural and ranching areas now existing in the North Cascades and surrounding areas. I wonder how many populated areas are in a range similar to the Yellowstone Park range from the mountains to Yellowstone Lake mentioned above.. Who will support the trash, livestock or orchard food source protection if they move from where they are 'placed'? Please note the article about communal trash collection and continuing issues developing bear proof trash containers. I doubt the environmental statement has any cost figures about projections on that cost. NOTE: there is a recommendation for Missoula, MT to use a system in force by Canmore, Alberta made by Chris Servheen a retired Fish and Wildlife Service biologist who supported restoring the bears to the lower 48.

So I'm sure the visitors to Okanogan, Winthrop, Chelan, Manson, Brewster and smaller communities further up in the North Cascades will be uninterested in trying to implement special trash collection for small populations spread over large areas. NOT to mention educating visitors to the area who continue to engage in activities that cause fatalities in the normal on water and hiking activities.

This is a bad idea. I'm sure it appeals to those who will not live with the consequences. I assure you it holds NO appeal to one of those who will have to live with the consequences. I may be reached by phone at [REDACTED] Thank you for your consideration.

Correspondence: I live in Wenatchee, WA. I fully support reintroduction of grizzlies to the NCE. I have lived and worked as an outdoor backcountry professional in grizzly and brown bear country in Montana and Alaska for most of my adult life. I know from personal experience that humans and grizzlies can co-exist and share the same space. I do not, however, support the 10j designation. I support grizzlies being reintroduced with the full protection of the endangered species act. The proposed number and placement of reintroduced grizzlies is in such a low number over many years in a large landscape that the adaptive management approach in the preferred alternative using the 10j designation is entirely unnecessary. 10j provides a more politically palatable approach to reintroduction but is unnecessary for operational success of reintroduction and establishment of a viable reproducing population. Thank you for your hard work.

Correspondence: I am writing this comment as an opposition to reintroducing grizzly bears to the North Cascades. My reasoning is explained in the following:

I have grown up exploring the North Cascades, I am a hiker, mountaineer, skier, trail runner, fisherman and lover of nature and I strongly believe in conservation, but reintroducing a predatory species that have been unseen for some time can have unpredictable negative effects. There will be more competition for resources with the established native species that still exist in the areas, and it is difficult to predict if grizzlies or black bears will be pushed closer to areas populated by humans to look for resources. I think our time and various resources could be best put to use to conserve our current species in the area. They should also be put use in order to keep access to our beautiful parks maintained so we can all enjoy and experience our lands as responsible stewards. There are a lot of trails, bridges and roads that are in desperate need of our attention in the North Cascades, and could greatly benefit from these resources that would be put towards grizzly reintroduction. In order to maintain this area as it continues to be become more popular these resources will be essential.

Another point of importance is safety. I have spent many years in Alaska and have seen first hand how aggressive the grizzly bear species can be. Reintroducing a predatory species in our north cascades will likely lead to dangerous encounters with hikers and those exploring our parks. Keep in mind the recent attack in Banff national park. While a lot of outdoor enthusiasts may know how to encounter a bear in the wild, there are many visitors and less experienced people that may not be able to correctly read the body language of a bear and/or know how to act in a potentially dangerous situation. All of us who have spent time in the North Cascades can probably understand how quickly the wind could render bear spray completely useless when the situation may call for such means.

I understand wanting to restore a species, but we should place our energy and resources on our current local restorations rather than uprooting these animals from their current home and reintroducing a species that has been absent for many years. Thank you for taking the time to hear our opinions on the matter and allowing us to give input.

Correspondence: Environmental Justice

The scope of the DEIS evaluation of environmental justice is deficient. The valleys of the Nooksack and Upper Skagit rivers, and associated tributaries, all within the NCE, has significant human habitation and construction, and extensive human recreational visitation. However analysis of these areas in the DEIS appears superficial and deficient; for example, human population within the County of Whatcom is not even considered.

As Long as Sex is More Popular than Death there will be increasing human population, and these folks will need place to live, work, and play. Human presence in and adjacent to the entire area of NCE habitat (both east and west side of the North Cascades) will only increase in the future, driving a corresponding increase in conflict with any introduced grizzly population. Many of these residents historically relied on resource extraction (lumber, mining) or resource exploitation (hydroelectric infrastructure construction and operation, livestock, renewable timber harvest practice). However, these economic activities have significantly decreased over time while the population has increased by orders of magnitude, leading to economically challenges for the resident human populations. This has created social challenges of poverty with some residents living a marginal existence. Many of these communities are attempting to meet economic challenges by increasing economic vitality through creating/improving opportunity for recreational opportunities. However, the introduction of grizzly to the NCE would adversely impact these efforts due to closure of access (the automatic first response by government entities to conflict), restraints imposed to human activities to 'protect grizzly health and reproduction', and reduction of tourist visitation due to fear.

Principles of environmental justice applied to this proposed action reveal an unequal protection from environmental and

health hazards due to the proposed action. Direct conflict with grizzly is without question an environmental / health risk issue. The social challenges of poverty are often linked with increases in other health challenges. The proposed action imposes both of these situations on the populations noted above creating a disproportionate burden on an economically challenged population.

Correspondence: I think the reintroduction of Grizzly bears into the North Cascades is dangerous and untimely. The bears can veer miles from where they will be introduced, and because their range, those bears will be alarmingly close to humans. Just this summer, there have been three reports of Grizzlies attacking and in some cases, killing hikers in the Pacific Northwest. There is no indication that the bears will not also be in danger by threatened and frightened humans. It is not hard to envision residents taking their own safety and dangers (whether real or imagined) into their own hands and destroying bears despite any laws or protections in place. Fear will always overpower laws that appear to threaten humans.

This is a bad idea, and it is one that will result in death on all sides of the equation.

Please DO NOT proceed with the plan to reintroduce the grizzlies to the Pacific Northwest.

Correspondence: To whom it may concern,

I am writing to support the restoration of grizzly bears to the North Cascades Ecosystem, their historic range for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C but with needed changes to the proposed 10(j) rule. The proposal would bring up to 25 non-conflict grizzly bears - likely from Montana - into remote areas of the North Cascades over the next decade and manage them as an experimental population.

The proposed 10(j) rule as currently written fails to give grizzlies the best chance to succeed and is too permissible in allowing reintroduced bears to be killed.

Lethal removal of a grizzly bear should only be considered where there is a demonstrable threat to human safety, and, for non-immediate threats to human safety, only after non-lethal management options, including concerted use of conflict prevention methods, have been exhausted.

No grizzly bears should be hazed or relocated as a result of conflict with livestock unless demonstrable, repeated efforts have been made by the livestock producer to prevent such conflicts, using commonly-available techniques.

No grizzly bears should be killed on public lands as a result of livestock depredation.

Landowners/private citizens should not be given a permit, or otherwise authorized, to kill a grizzly bear.

No grizzly bear should be preemptively relocated if the bear is not a threat to human safety, particularly if the bear has not become habituated or food-conditioned, or when nonnatural foods/attractants have not been properly secured and made inaccessible to bears. Doing so acts as a disincentive for communities to employ conflict prevention measures, and increases the risk to the bear of injury or death from capture and relocation.

These changes are crucial in providing adequate protection for grizzly bears.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C and with appropriate changes to Section 10(j). Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Correspondence: In proposing the reintroduction of Grizzly into the NCE through application of ESA Section 10(j), the government specifically recognizes this is a non-essential, experimental population, as specifically declared by the 10(j) language.

However, the proposed habitat includes areas of significant human intrusion (orders of magnitude increases in human population, visitation, and construction since historic presence of any grizzly population has been recorded). Human recreation, habitation, and construction have irreversibly altered the nature of the proposed habitat in a manner non-supportive of the proposed species and greater impact will occur into the future resulting in conflict between the grizzly and humans, ultimately there will occur fatal consequences for both species. With these considerations, it is clear the proposed habitat has been unsuitably and irreversibly altered or destroyed by human presence and actions and is therefore not conducive to a successful (and safe) reintroduction of a grizzly population. With an ESA listing, 10(j) proposal does not offer adequate tools to manage the grizzly and prevent conflict with humans. Also, the 10(j) proposed action does not offer adequate protections to humans who may experience conflict with a grizzly. Under these restrictions, the only path available to ensure no loss of grizzly is to not introduce them into an area of likely conflict. This is a non-essential experiment with fatal consequences for grizzly and human.

Correspondence: This proposal seems to be relying on the assurances of supposed experts' assurances that there are zero safety concerns in introducing this apex predator to this area. I, and many residents of the proposed area all disagree. Rather than introducing seven bears annually, a better proposal would be to allow grizzly bears to naturally find their way into the North Cascades from both Canada and Idaho (via eastern Washington, where they have naturally migrated into). In summary, no to this reintroduction proposal.

Correspondence: Hello -

I'm writing to support grizzly bear recovery plans for the North Cascades, one of a few remaining places in this world that's big and wild enough for grizzly bears. And big and wild enough for grizzly bears and people to co-exist.

I support Alternative C, and appreciate the 10j rule proposal. Please reclassify the Okanogan Range/Loomis Forest as Zone 1. Grizzly were documented at Snowshoe Mountain, Chopaka, and Long Draw well through the 1960s, where ample grasses, roots, and white-bark pine occur. The area is well connected with the North Cascades and should managed for population recovery.

I also ask that you manage lethal take, rather than delegate lethal take to others, when all other deterrence and relocation options have been exhausted.

I also support providing financial aid or otherwise outfitting lower income communities with bear proof garbage cans and dumpsters, hotwire fencing and other measures to prevent conflicts. If that's a cost, it should be assessed in the EIS.

Thanks for the public hearings recently. I believe it would have been more productive if you'd offered some information, introduced the topic, explained 10j, etc. before opening up the floor for comments.

Sincerely,

Correspondence: Hello, I live less than a mile from our local salmon hatchery and have personally already encountered black and brown bears where I live. Grizzlies have been a protected species in the region for over thirty years and exist in bordering states. The grizzlies are not here because the ecosystem does not have enough draw to support their migration.

In comparison to our border states, the state of WA has a population of over 7 million people - triple that of what most states with active grizzly populations have, there is no doubt in my mind that there will be a higher human impact here than occurs in states already experiencing grizzly attacks, like MT, AK and WY. When I first read this was being proposed, sincerely and truly, it felt like my federal government was actively trying to put my life and the lives of everyone who resides or vacations here in harms way.

Upon learning that the state of WA has already passed legislation prohibiting the transplant of grizzlies to the state, it seems like malicious government overreach.

I now find myself wondering why 1970s legislation protecting a species that has basically been removed from the endangered species list is taking a higher priority to federal tax dollars than any human living does. The federal government is in the wrong in this scenario and all that will come of this incredibly expensive plan is death and destruction. The people of WA have already voted on the issue and that ought to be the end of it. Moving forward will lead to dead humans which will lead to dead bears too.

Sunken cost fallacy will dictate that you've 'come too far to stop now';. Will that be what you tell the parents of the first killed in a grizzly attack?

Correspondence: I am writing to STRONGLY support the restoration of grizzly bears to the North Cascades Ecosystem--brong them back!! A healthy ecosystem requires them.

I support Alternative C but with needed changes to the proposed 10(j) rule. The proposal would bring up to 25 non-conflict grizzly bears - likely from Montana - into remote areas of the North Cascades over the next decade and manage them as an experimental population.

The proposed 10(j) rule as currently written fails to give grizzlies the best chance to succeed and is too permissible in allowing reintroduced bears to be killed. THE below changes must be made--

--Lethal removal of a grizzly bear should only be considered where there is a demonstrable threat to human safety, and, for non-immediate threats to human safety, only after non-lethal management options, including concerted use of conflict prevention methods, have been exhausted.

--No grizzly bears should be hazed or relocated as a result of conflict with livestock unless demonstrable, repeated efforts have been made by the livestock producer to prevent such conflicts, using commonly-available techniques.

--No grizzly bears should be killed on public lands as a result of livestock depredation.

--Landowners/private citizens should not be given a permit, or otherwise authorized, to kill a grizzly bear.

--No grizzly bear should be preemptively relocated if the bear is not a threat to human safety, particularly if the bear has not become habituated or food-conditioned, or when nonnatural foods/attractants have not been properly secured and made inaccessible to bears. Doing so acts as a disincentive for communities to employ conflict prevention measures, and increases the risk to the bear of injury or death from capture and relocation.

These changes are crucial in providing adequate protection for grizzly bears.

I'm an avid hiker, and have deeply appreciated my hikes in grizzly habitat. I was fortunate enuf to see 2 grizzlies when hiking in AK. Top predators rule!!

thank you

Correspondence: I strongly urge the National Park Service to choose Alternate A: No Action.
"Because they once thrived" is not an acceptable reason to reintroduce an apex predator into our communities putting ourselves and loved ones at risk. With fetal Grizzly Bear attacks on the rise (11 since 2020), reintroducing these bears is costly both financially and emotionally. Even if the risk of a fetal attack is low; it is still there. The only way to keep 0 deaths in WA by Grizzly Bears is to take no action.
The financial cost of relocating bears, the risk to those bears safety, and the negative effects on our ecosystems (both the original bear location and relocation), is far greater than any possible positive outcome. The notion to reintroduce this species is irresponsible and unnecessary.
If Grizzly Bears are reintroduced, it will only add stress to our outdoor recreational activities and livestock businesses. But worst of all, it will only be a matter of time until one of our loved ones are killed by these dangerous creatures.

Correspondence: Hello, my name is Austin Westwong. I was born and raised here in the Stillaguamish Valley, and am currently residing at the foot hills of the North Cascades.
I wanted to give my opinion on this matter with really well thought out detail, but like a lot of people I am a husband, father of two young kids, and a full time working/full time contributor to our society, and just could not get the time to really prepare something with full attention.

All of that being said here is my comment.

I fully support Alternative A: No action.

I am a outdoorsman, and spend a lot of time enjoying our beautiful ecosystem with my family year round. If these bears are released in this area it will directly affect me and my family.

I was at the Darrington public meeting, where the NPS rep Striker made a statement that "this is an emotional subject and people have emotional comments." I agree with this 100%, and there were a lot of emotional for as well as opposed comments that night. I also heard some logical, and science based comments, but these comments were only from folks opposed to the idea.

Emotionally I would love to see the wild places of our Cascade Range remain wild, with all animals thriving (including the Grizzly.) But to manage an ecosystem, and wildlife in all, one cannot let emotion persuade their decision making. Without any emotional involvement this reintroduction makes no sense to me.

"Restore where they once lived, Contribute to the ecosystem, Enhance long term survival of Grizzly's, and get them off the federal list of endangerment."

-These are the "Needs" for reintroduction. Without emotional involvement I cannot help but think; lots of things have changed since grizzly bears and other creatures of the past roamed here. Trying to bring something back because it was the natural way of life into a completely unnaturally changed setting just doesn't add up.

-What benefits do these large brown bears bring to the ecosystem that there thriving, surviving, and majestic little cousin the black bear doesn't already? Black bears are found at the bottom of the valleys and at the top of the cascades. Would bringing 200 large bears benefit the ecosystem more than the 1,500 plus smaller bears already here? Once again this doesn't add up.

Long term survival of Grizzly's as a whole seems to be looking up. Neighboring states in the lower 48 are seeing more and more. This species is not in decline outside of the North Cascades. Especially North of the Border. I have read that these animals are doing so well in Yellowstone area's that they have already been taken off endangered entitlement before.

The local tribe members said it themselves, its pains me to say it because these bears are a part of our native way of life and natural wild world. But we do not have the land, and food for these bears to survive alongside man.

I provide my family of four with only wild game meat sourced from these hills. Just as all mankind has done. I can tell you from personal physical involvement, we don't need another predator in this area. Times have changed, and man has changed the natural setting.

These are my personal thoughts without emotion. I am no biologist, or wildlife manager. I am a blue collar citizen who shares his life and respect with the natural world. I work a full time job, and cannot dedicate my time to what is happening in our ecosystem. You and all the folks in the WDFW can. Make the right logical choice and strive to do better. Please.

Thank you for taking a nobody's comment into consideration.

With respect.

Correspondence: I would like to express my objections to the entire process being used to reopen the program introducing Grizzly Bears to the North Cascades. My objections are:

The comment period is much too short to outline the errors in the Plan in depth. These objections have been outlined before but evidently have been ignored. New data for instance show a Grizzly Bear range to be much greater than previously thought. This information shows many towns and communities to be at risk

Grizzly Bears are naturally found in Canada, just north of the border, and have no boundaries that have prevented their natural movement into the North Cascades. Any action should take into consideration that natural process should always prevail.

Grizzly Bears are magnificent creatures but are also an apex predator that has no fear of humans.

Anyone that has ever lived with Grizzlies has a justifiable fear of what they are capable of doing to anyone that inadvertently is in the wrong place at the wrong time.

The only reasonable conclusion in this case is to EXTEND the comment period

The only reasonable option is

NO ACTION

Correspondence: The few grizzlies in the North Cascades are VERY good at avoiding people and creating problems with people. I'm not aware of another population of such people-avoiding grizzlies. I worry that bringing in new grizzlies from elsewhere will create problems for the new bears that they are not adapted for. I am in favor of protecting the current bear population and allowing it to increase. I do not think that new bears should be introduced to the area. IF new bears are introduced, then Alternative C should be used to manage them and the people around them.

Correspondence: How is this even a question? Grizzly bears belong in the North Cascades because they were there long before humans began invading their territories. We must begin to undo the colonization that forced these bears out of their homes.

You must be the guest if you live in or visit bear territory. Removing any apex predator disturbs the natural balance in ways we can't even begin to understand.

I have been with bears in the wild - grizzlies in Alaska, brown/black bears in the North Cascades and on Mt. Rainier, and polar bears off the Labrador coast. I visited their domain. I obeyed common sense bear etiquette and had zero issues.

Please help restore the natural order by reintroducing animals to their original habitats!

Sincerely, [REDACTED]

Correspondence: I am strongly in support of the proposed regulations. This proposal has been discussed for over 20 years; it is time to bring it to...bear! (Pun intended.) Restoring this apex predator to the ecosystem will be good for the North Cascades, good for tourism, and good for Washington State's ecology. As an avid backpacker and NCNP user, I urge the NPS to bring this proposal forward.

Correspondence: If the NPS & USFW hopes to receive informed, thoughtful, and substantive comments from the general public, an extension to the comment period is necessary. Six weeks is not enough time to read the EIS and associated studies and research papers and compose cogent comments for submission. Submitting substantive input requires time.

Citizens responding to this DRAFT EIS are responding to a plan that has been over a decade in the making and requires significant time.

At the present time, I cannot substantively comment on the Draft EIS; therefore, I would support "No Action" until an extension for comment is granted.

Thank you for the opportunity to comment. Hopefully, more time will be granted to study and respond to the Draft EIS.

Correspondence: The DEIS does not address complementary activities from the proposed action - reintroduction of other species absent from the NCE due to human depredation. These activities, not included in DEIS analysis, present cultural, ecosystem, and risk management considerations.

The proposed action to introduce the apex predator grizzly is only one part of the process of reintroduction of species that have been eliminated from the NCE habitat due in part to past human hunting practices. Current agrarian human populations are culturally deprived to not have the experience of an orchard being ravaged by a meandering Mastodon or a wheat field being consumed by a Columbian Mammoth; similarly, backcountry travelers miss being serenaded to sleep by the night-time howl of a dire wolf. Reintroduction of these species, and others such as the Sabre-tooth cat (Smilodon), are within near-term human technical capability due to advances in DNA recovery, genetic engineering, and through surrogacy by biological compatible current species. Their reintroduction would drive an enhanced ecosystem balance not seen in recent memory. The grizzly, a competing apex predator, would likely be kept in check by some of these other predators; and the mastodon, a herbivore foraging on undergrowth and small trees in the NCE would create decreased fuel loading and subsequent reduction in wildfire risk. The creation of a laboratory specific to this restoration effort would bring economic benefit to challenged local economies adjacent to the habitat, and a public viewing location would drive increased ecotourism (Quaternary Park). It is obvious that any grizzly reintroduction into the NCE would be the first step in restoration of these and other megafauna to the NCE, addressing past elimination from the ecosystem due in part to human hunting.

Correspondence: Please, please do not follow through with Alternatives B or C. I can't even begin to fathom the damage this could do were 200 grizzlies to be introduced into the NCE. This beautiful area provides so much joy, wonder and awe to countless people. I have a hard time believing that there is only "potential" for negative human-grizzly bear interactions. There will undoubtedly be deaths, both bear and human, if this goes through. You state it's estimated that 2% of the grizzly bear population in the NCE would be lost to human-caused mortality each year. How many humans lives will be lost? More and more people recreate on the backcountry, and despite numbers of bear-caused injury in the last 42 years being low, we have all seen the explosive growth of hiking in the parks. So injuries and deaths will also increase.

In this 303 page document, it is stated that restoration of grizzly bears to the NCE could increase visitation and recreational use of the park and national forests as visitors seek to experience grizzly bears in their native habitat. This would absolutely NOT be the case. I know so many people who will absolutely not be taking the chances of running into grizzlies, and this will reduce the number of people who visit the NCE. I also have an extremely hard time believing that introduction of grizzlies would not involve any disturbance of fish habitat, OR change populations of other animals listed when it's specifically stated that a reason to introduce the bears is for prey control.

In addition, further human lives will be put at risk because despite allowing lethal take in limited circumstances, there are many areas where it is illegal in parks to discharge a firearm. So you face litigation or death/ injury. I do not like guns, and have never wanted to own one yet it seems that would be the only defense I would have if I want to continue to hike and backpack in these areas.

On a personal note, as a single female, I already take an increased risk hiking alone. I have to be mindful of cougars/ cats, black bears, and human men, all while trying to be at peace in nature. Now to add another predator?

I strongly urge whoever is considering these options to NOT pursue alternative B or C. I do not believe that the (potential) benefits listed outweighs the danger to human and bear life, the financial cost, or the ecological changes that will occur.

Re: Public Comment on 50 CFR Part 1, Docket No. FWS-R1-ES-2023-0074, Establishment of a Nonessential Experimental Population of Grizzly Bear in the North Cascades Ecosystem, Washington State, and Draft North Cascades Grizzly Bear

Restoration Plan / Environmental Impact Statement

Dear U.S. Fish and Wildlife Service/National Park Service:

The American Forest Resource Council (AFRC) submits the following comments regarding the U.S. Fish and Wildlife Service (FWS) proposal to establish a nonessential experimental population (NEP) of the grizzly bear within the U.S. portion of the North Cascade Ecosystem (NCE) in the State of Washington under section 10(j) of the Endangered Species Act (ESA). Additionally, these comments are submitted on the National Park Service (NPS) Draft North Cascades Grizzly Bear Restoration Plan/Environmental Impact Statement ("Draft Grizzly Restoration Plan").

AFRC represents over 50 forest product businesses and forest landowners throughout Washington, Oregon, Idaho, Montana, California, and Nevada. . AFRC's mission is to advocate for sustained yield timber harvests on public timberlands throughout the West to enhance forest health and resistance to fire, insects, and disease. We do this by promoting active management to attain productive public forests, protect adjoining private forests, and assure community stability. We work to improve federal and state laws, regulations, policies, and decisions regarding access to and management of public forest lands and the productivity of all managed forest lands. Many of our members have their operations in communities adjacent to the Mount Baker Snoqualmie (MBS), Gifford Pinchot (GPNF), Okanogan-Wenatchee (OkWen), and Colville (CNF) National Forests. The management of these lands ultimately dictates not only the viability of their businesses but also the economic health of the communities themselves.

Our members also rely on the many forestland owners in Washington state who actively and sustainably manage their lands. This includes the trust lands managed by the Department of Natural Resources, which benefit defined beneficiaries, including schools, fire/EMS services, libraries, and county services.

The forest products sector in Washington State continues to provide around 40,000 direct and 100,000 indirect jobs. Many of these jobs are found in rural communities near these National Forests and surrounding areas. In addition to the wages paid, the taxes and other monetary transactions generated by these businesses and family-wage jobs, contribute to the infrastructure and well-being of the local communities.

The lack of supply of raw materials to fill manufacturing demands for wood products continues to be an issue in Washington. There has been a desire by several communities, including Chelan County, to recruit new wood products manufacturing infrastructure to their communities. These projects and the existing infrastructure can only succeed with a stable and reliable timber supply. The economic activity created through these treatments contributes to the greater community's well-being. Further reductions in manageable acres and associated reductions in volume harvested will put the entire sector at risk.

Additionally, AFRC and our members have invested significant time and resources into the effort to increase the pace and scale of forest health treatments on these National Forests. The State of Washington has also invested millions of taxpayer dollars into assisting the US Forest Service in addressing its forest health crisis. Additional regulations, such as any related to the potential grizzly reintroduction in the North Cascades Ecosystem, could slow this critical forest health work, putting not only human lives at risk but also much of the work to enhance habitat for other endangered species, such as the Northern Spotted Owl (NSO). We have already seen grizzly bear-related regulations slowing the needed forest management work to address the risk of catastrophic wildfire in Region 1 of the US Forest Service.

AFRC's primary concerns are related to any impacts the reintroduction of grizzlies would have on the ability of non-federal landowners, especially the Department Natural Resources trust lands program, to conduct otherwise legally allowed forest management on their lands. We are also very concerned this effort could negatively impact land management activities on US Forest Service-managed lands.

Mortality from insect and disease infestations along with catastrophic wildfires has negatively impacted the habitat on federal lands of other listed species that require last successional characteristics. Any re-introduction plan should consider the trade-offs between the need for active forest management to prevent the further loss of habitat for species such as the NSO with the need for grizzly bear habitat.

Appendix B of the Draft EIS includes references to existing land use plans for US Forest Service managed lands. The following is the standard in the OkWen and MBS current LRMPs:

No net loss of existing core area within any Bear Management Unit (BMU), with core area defined as area >0.3 miles from any open motorized access route or high-use nonmotorized access route.

The EIS goes on to conclude that "Based on agency review of the local land use plans, the restoration of grizzly bears to federal lands within the NCE grizzly bear recovery zone is unlikely to result in substantial conflicts with objectives identified in local land use plans."

As mentioned above we have seen the US Forest Service in Montana experience difficulties with LRMP implementation due to grizzly bears. This has included impacts from illegal road use outside the control of the agency. As part of its vegetation management environmental analysis, the Forest Service has analyzed any potential impacts to grizzlies from roads and provided mitigation efforts such as seasonal road closures. However, we have seen implementation challenges to work due to the illegal use of roads by the public during these closures. We would like to see assurances that vegetation management projects, especially for forest health and wildfire risk reduction are not adversely impacted due to illegal use of Forest Service lands by the public.

While AFRC is not declaring a position on the reintroduction of grizzlies to the NCE, we do support the selection of Alternative C within the EIS. Designating the population as a NEP of the grizzly bear under section 10(j) of the ESA would appear that if re-introduction proceeds this would provide the greatest assurances possible to non-federal landowners as well as the implementation of forest health work on US Forest Service lands. We believe that Alternative C provides the ability to continue to conduct otherwise legally allowed activities on these lands.

We encourage the USFWS and NPS to make the following clarifications prior to adoption of an alternative:

- Road use permits granted by the U.S. Forest Service to nonfederal entities where the road in question is not located on National Forests should not need ESA Section 7(a)(2) consultation. At present the exemption appears to apply only to National Forest Lands.
- Consideration for road maintenance agreements and easements granted to non-federal entities should also be considered for exclusion from ESA Section 7(a)(2) consultation.
- Any nonfederal lands within the proposed boundary of Management Zone 1 and Management Zone 2 should be explicitly identified as Management Zone 3 by definition. Relying on the Figure 1 map may lead to errors and interpretation differences.
- Forest managers, loggers, and others conducting otherwise lawful forest management activities should be included in the list of those authorized to conduct non-lethal deterrence activities.
- Permissible incidental take on nonfederal lands should include any habitat modification resulting from otherwise lawful forest management activities consistent with the Forest Practices Act and Rules and/or pursuant to an approved Habitat Conservation Plan, Enhancement of Survival Permit, or similar federal authorization.
- The nonlethal incidental take reporting requirements due to habitat modification resulting from otherwise lawful activities are impractical and should be exempted from reporting

Thank you for the opportunity to comment on this proposal. Should you have any questions regarding the above comments or would like additional information, please contact me at 360-352-3910 or mcomisky@amforest.org.

Sincerely,

Washington State Manager

Correspondence: To whom it may concern,

I am writing to support the restoration of grizzly bears to the North Cascades Ecosystem, their historic range for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

Bring back the bears!

I support Alternative C but with needed changes to the proposed 10(j) rule. The proposal would bring up to 25 non-conflict grizzly bears - likely from Montana - into remote areas of the North Cascades over the next decade and manage them as an experimental population.

The proposed 10(j) rule as currently written fails to give grizzlies the best chance to succeed and is too permissible in allowing reintroduced bears to be killed.

Lethal removal of a grizzly bear should only be considered where there is a demonstrable threat to human safety, and, for non-immediate threats to human safety, only after non-lethal management options, including concerted use of conflict prevention methods, have been exhausted.No grizzly bears should be hazed or relocated as a result of conflict with livestock unless demonstrable, repeated efforts have been made by the livestock producer to prevent such conflicts, using commonly-available techniques.No grizzly bears should be killed on public lands as a result of livestock depredation.Landowners/private citizens should not be given a permit, or otherwise authorized, to kill a grizzly bear.No grizzly bear should be preemptively relocated if the bear is not a threat to human safety, particularly if the bear has not become habituated or food-conditioned, or when nonnatural foods/attractants have not been properly secured and made inaccessible to bears. Doing so acts as a disincentive for communities to employ conflict prevention measures, and increases the risk to the bear of injury or death from capture and relocation.

These changes are crucial in providing adequate protection for grizzly bears.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to The Cascades through the strategy laid out in Alternative C and with appropriate changes to Section 10(j). Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Thank you

Correspondence: RE: Grizzly Bear Restoration into the Cascades

I am very much against this project. I respect wildlife as it currently exists but I also feel bringing back grizzly bears will make it more unsafe for hikers, skiers, naturalists, etc. and prey animals who are there, some of them struggling to survive. There are already black bears in large numbers that already cause problems for humans either by coming into residential areas or are problems to hikers and campers. We don't need to add grizzly bears to the mix. Grizzlies already have their living spaces in Alaska, Montana, Wyoming and other places where they are well established and thriving. It isn't worth risking lives of hikers who want to enjoy our mountains without having to fear being attacked, maimed, or killed by a grizzly. Please do not bring grizzly bears into Washington state.

Sincerely,

██████████

Correspondence: I am writing to strongly support the restoration of grizzly bears to the North Cascades Ecosystem, which is their historic range. Here grizzly bears would thrive, in an environment of clean water and abundant native fish and other wildlife populations.

I support Alternative C, but with important changes to the proposed 10(j) rule. The proposed action would bring up to 25 non-conflict grizzly bears (possibly from Montana) into remote areas of the North Cascades Ecosystem over the next decade and manage them as an experimental population.

The proposed 10(j) rule, as currently written, fails to give grizzlies the greatest chance to succeed and survive and additionally poses a significant likelihood that the reintroduced bears could be killed for no adequate rationale. Lethal removal of a grizzly bear should only be considered where there has been a clearly demonstrated threat to human safety, and, for non-immediate threats to human safety, and then only after non-lethal management options, including concerted use of conflict prevention methods have been completely exhausted.

No grizzly bears should be relocated because of conflict with livestock unless demonstrable, repeated efforts have been made by livestock producers to prevent such conflicts, using commonly available techniques. Particularly, no grizzly bears should be killed on public lands as a result of livestock depredation or alleged depredation.

Landowners or other private citizens should not be permitted, or otherwise authorized, to kill a grizzly bear. No grizzly bear should be preemptively relocated unless that particular bear is deemed a threat to human safety, particularly if the bear has not become habituated or food-conditioned, or when nonnatural foods/attractants have not been properly secured and made inaccessible to bears. Unjustified removals act as a disincentive for communities to employ potentially effective conflict prevention measures, and increase the risk to the bear of injury or death from capture and relocation procedures. These changes are crucial in providing reasonable and adequate protection for grizzly bears.

Public opinion polls have demonstrated broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades Region. Please bring back this native species to our state through the strategy laid out in Alternative C, but with the appropriate changes to Section 10(j) as discussed above. Doing so will restore an important piece of our ecosystem, regional culture, and our natural heritage.

Correspondence: The grizzly bear restoration plan is a terrifying idea. As a hiker, I have appreciated the great outdoors here in Washington without having to worry about grizzly bear encounters. The black bears I have encountered when hiking tend to go about their business, but that might not be the same case crossing paths with a grizzly.

Correspondence: Grizzlies were here long before we were. Bring them back. When I was a boy, my Dad and I watched them wandering on the ridges high above us while camping at Monogram Lake, near Lookout Mountain in the North Cascades. It changed my entire perspective on the world and my place in it, seeing these massive creatures with their own lives, their own families, and sharing our mountain places with them.

Thank you,

Correspondence: I am against the introduction of Grizzly Bears in the North Cascades. There is documented evidence the the Grizzly bear is already in the North Cascades and if the habitat is sufficient for them to exist they will do so on their own and increase population without wasting time and money relocating them. The North Cascades have a sufficient predator base with mountain lion and black bears.

Correspondence: As a resident near, and frequent user of, North Cascades National Park and Mount Baker Snoqualmie National Forest, I support Alternative A: No Action. These wilderness areas differ from current grizzly bear habitats as they are within an hour of a major population center. Masses of recreationists flood these areas during peak season, and will result in human-bear encounters. Proper food storage and wilderness ethics practices are not enforceable with the sheer number of humans currently in the back country, and the negative side effects of this will only be exacerbated with the presence of grizzly bears. I would like to keep these mountains as safe as possible for both humans and animals for years to come, and with an ever growing population this means not introducing a new predator that we are inadequately prepared to live with.

Correspondence: I do not think it's a good idea to reintroduce grizzly bears to the North Cascades National Park. I strongly recommend going with Alternative A: no action. I am very concerned about the safety of hikers, especially backcountry hikers. There have been a concerning amount of grizzly bear attacks in other areas where grizzly bears are present, like in National parks in Canada. It especially effects people who are hiking in the back country doing overnight trips or even day trips in less populated trails and areas. I am one of those people and I would be very concerned about the added threat of grizzly bears. It is not worth the threat to hikers lives. Even though the number of backcountry hikers or hikers in less populated areas is small, their lives and safety are still very important. I would no longer feel safe hiking trails by myself or doing overnight trips on less popular trails. It is very concerning. I hope you consider that there are a fair amount of people who enjoy being out in nature on less populated trails or in the backcountry and this would drastically affect their safety and could cost them their lives. It is not worth that risk.

Correspondence: I oppose the Grizzly Bear Restoration Plan in the North Cascades Ecosystem for several reasons. Firstly, the introduction of grizzly bears could pose a significant threat to local communities and their livestock. Additionally, concerns about potential conflicts between humans and grizzlies raise valid worries about public safety. The economic impact on industries like agriculture and tourism cannot be overlooked, as the presence of these apex predators may deter visitors

and disrupt existing ecosystems. Overall, I believe alternative conservation strategies should be explored to protect both the environment and the well-being of local communities.

Correspondence: Superintendent Donald Striker
North Cascades National Park Complex
810 State Route 20
Sedro-Woolley, WA 98284

November 11th, 2023

Dear Superintendent Striker,

Thank you for the opportunity to comment on the U.S. Fish and Wildlife Service and National Park Service's joint Draft Grizzly Bear Restoration Plan / Environmental Impact Statement (EIS) for the North Cascades Ecosystem (NCE). Methow Valley Citizens Council (MVCC) would like to express our strong support for Alternative C of the draft EIS -- active grizzly bear reintroduction alongside a 10(j) rule.

Grizzly bears were an integral part of our ecosystem here for over 20,000 years until settlers hunted, trapped and poisoned them to local extinction. We now have the once-in-a-lifetime opportunity to bring them back, and many community members in the Methow Valley and wider Okanogan County support this initiative. The North Cascades is ideal grizzly bear habitat: with nearly 10,000 square miles of mostly public lands, the recovery area encompasses enough space for successful reintroduction. We also know there is enough food for bears here: nearly 80% of the diets of interior grizzly bears consist of berries, roots, tubers and insects, and of the 124 different species of plants that grizzlies have been shown to eat, the North Cascades is home to 100.

Through connections with other organizations and agencies doing wildlife coexistence work we have seen firsthand how rural communities in neighboring states very similar to ours ecologically, socio-economically and culturally are already living, recreating and thriving alongside grizzly bears. We know that preventative coexistence measures like electric fencing, carcass composting programs, range riding and bear-proof garbage containers have been proven to work with grizzlies. MVCC and other organizations here are eager to help facilitate the implementation of these necessary conflict prevention strategies, but to do so, we will need additional resources and funding. While the Methow Valley currently has a 'Bear Aware' program, much more work needs to be done to get our communities ready for grizzly bears, and MVCC does not feel the current draft EIS adequately plans for those needs. The potential for conflict with humans is arguably the biggest threat to grizzly recovery in the NCE, and we live in a region whose population of both full-time residents and visitors is growing. We strongly believe living alongside grizzly bears is possible, but it will require increased education campaigns and even legal mechanisms (like food storage orders) to adequately prepare for the presence of grizzlies and to keep both humans and bears safe. Please explicitly include these in your plan.

MVCC also supports implementation of the 10(j) rule, with one caveat: while we appreciate the management flexibility it provides for local agencies, we do not feel it is appropriate to give lethal take authorization to private landowners. In situations of extreme conflict when other forms of deterrence or relocation are exhausted, we strongly advocate that local management agencies be in charge of handling bears rather than private landowners.

MVCC is also disappointed that agency staff did not take advantage of this last round of public meetings to share accurate information about the complex 10(j) rule with our communities. In the face of fear-based misinformation campaigns run by opposition in Okanogan County, many community members were simply never given a real opportunity to learn. Going forward, we hope that agency staff will reconsider the format of their meetings to also include the presentation of accurate, up-to-date relevant information in a group setting. This is a specific ask that we have heard repeatedly from many people

within our community.

Through our outreach work over the last few years, we have also heard many in the Methow and Okanogan valleys voice concerns specifically for the wellbeing of the individual translocated bears. Beyond being mere members of a 'population', these individuals have intrinsic value in and of themselves, and we hope that each of them will be treated with the utmost care, respect and reverence through the disorienting process of translocation. This is critically important as we shift toward a culture that values the rights of nature.

Here in WA and around the globe we are facing a biodiversity crisis of immense proportion, we're losing species left and right, a trend that is only expected to increase as we continue to see the growing impacts of climate change. We are encouraged by recent studies that have shown that under nearly all of the various potential climate models ahead, the NCE will only become better, more viable grizzly bear habitat. Grizzlies are an endangered keystone species that belong in the North Cascades - - they have a right to be here - - and we as a community have an incredible opportunity to bring them back, making our ecosystem more resilient for future generations by doing so.

Thank you for your hard work on this decades-long project. We are excited at the prospect of having grizzly bears back on the landscape again.

Sincerely,

Public Lands and Wildlife Program Coordinator
Methow Valley Citizens Council

Correspondence: Dear Sir/Madam

I am writing to support the restoration of grizzly bears to the North Cascades Ecosystem, their historic range for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C but with needed changes to the proposed 10(j) rule. The proposal would bring up to 25 non-conflict grizzly bears - likely from Montana - into remote areas of the North Cascades over the next decade and manage them as an experimental population.

The proposed 10(j) rule as currently written fails to give grizzlies the best chance to succeed and is too permissible in allowing reintroduced bears to be killed.

Lethal removal of a grizzly bear should only be considered where there is a demonstrable threat to human safety, and, for non-immediate threats to human safety, only after non-lethal management options, including concerted use of conflict prevention methods, have been exhausted.

No grizzly bears should be hazed or relocated as a result of conflict with livestock unless demonstrable, repeated efforts have been made by the livestock producer to prevent such conflicts, using commonly-available techniques.

No grizzly bears should be killed on public lands as a result of livestock depredation.

Landowners/private citizens should not be given a permit, or otherwise authorized, to kill a grizzly bear.

No grizzly bear should be preemptively relocated if the bear is not a threat to human safety, particularly if the bear has not become habituated or food-conditioned, or when non-natural foods/attractants have not been properly secured and made inaccessible to bears. Doing so acts as a disincentive for communities to employ conflict prevention measures, and increases the risk to the bear of injury or death from capture and relocation.

These changes are crucial in providing adequate protection for grizzly bears.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C and with appropriate changes to Section 10(j). Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Sincerely,

[REDACTED]

Correspondence: As an avid backcountry hiker and climber, annually I spend many days within the proposed NCE area. This year I again traversed within all three of the proposed Grizzly releasement zones. While inside these extraordinary spaces I welcome the afforded solitude but in so doing I have regularly (and disappointingly) observed a paucity of small mammals and of larger ungulates. Which is to say by my experience I do not believe that an adequate supply of these would-be and necessary food sources presently exist sufficiently to sustain the re-establishment of a sufficient grizzly bear population. This is my 'feet on the ground' opinion and coupled with other reasons I support Alternative A - the No restoration Action.

Many of our national parks, monuments and wilderness areas struggle with a dichotomy: preservation/ecosystems vs. personal

use & liberties. This problem is the crux of the controversy that exists with the proposal. The Draft EIS brushes over this problem with an attempt to persuade that the potential (likely?) personal downsides don't exist or can be easily mitigated. To wit - From the Draft EIS executive summary: 'Purpose and Need Contribute to the restoration of biodiversity of the ecosystem to build ecological resilience and for the benefit and enjoyment of present and future generations of people.'

George Orwell, author of Animal Farm, wrote that 'All animals are equal, but some animals are more equal than others'.

As witnessed by the extreme differences of opinions via the prior 2022 public scoping correspondence this question arises - Would the proposal's preferred alternative C unequivocally 'provide for the enjoyment of present and future generations of people' as per the above? Certainly not as it depends on which side of the dichotomy these 'present and future' people may benefit from - or not. With the current public comment period in process another round of 'opinions' will soon be layered in. On the surface this will be a bit overwhelming to properly tally and assess. On the other hand perhaps this task need not be daunting. Why? My answer - I submit that 'some people are more equal than others.

Although many of the proposed NCE areas are of wilderness quality suitable for biodiversity they are equally places for people to use and enjoy. We can all vicariously relish and enjoy from a distance: as in knowing that certain 'far away areas' of biodiversity do exist and provide stability. However for those persons who actively use these NCE areas; for those who intend to do so; and for those potentially economically impacted by the proposed restoration plan - their comments should be 'more equal' when it comes to the ranking assessment of their submittals.

Conversely other comments should be relegated. Flippant comments like "We need to restore our earth's balance to save our planet" are just that: glib and it would be wrong to give them any value or status. Extracting from those earlier 2022 comments there are hundreds upon hundreds of group copy/submitted comments like that of " A healthy population of grizzly bears belongs in the NCE ..." or "Thank you for moving forward with the process of restoring grizzly bears to the ..." Those types of comments were sent only to stuff the ballot box. Same for the other version which begins "[I] Oppose the capture of grizzlies from the Northern Continental Divide Ecosystem". Most all of these comments are identified as coming from persons far distant from Washington State, This begs the question of how valuable their comment really is. And I'm certain that many or most of these persons have not or never will visit the NCE area. I hope that the agency's authors and promoters of this draft EIS/action are professional enough to structurally discount these types of comments by assessing them as a single (1) comment together with questionably solicited support. I'd expect the same of my opinion if I were to simply click upon a web-link expressing strong opinion on some poignant proposal, for example an important issue to the Everglades community a place I'm never seen and won't be visiting.

As for the food chain, I submit that 'some animals are more equal than others. Grizzly Bears may well be omnivores, but meat definitely is high on their preferred menu. Would be starving Grizzly Bears will not be dissuaded from finding food. Likely they might prey upon easy to kill domestic stock since Grizzlies will learn and then be able to travel widely if need be. Then again, as we've learned this past September, any meat will do as did befell the horrific fate of two campers in Banff National Park. When placed in harm's way, theory and good intentions go out the proverbial window and anyone so commenting on their held belief of a safe coexistence with Grizzlies, (perhaps for purpose of biodiversity and/or their personal enjoyment) would certainly have 'their foxhole conversion' in such a desperate confrontation. No doubt just as happened to the famed but foolish Timothy Treadwell in Alaska, as per his own audio record of anguish when attacked and eaten.

Of course, we all take chances in life but why temp fate. But sadly, whose temping who? The NPS and NFWS agency authors, proponents and decision makers must at this moment in time recognize their own culpability in their likely queuing of the fate and lives of a few human beings other than themselves. Such will happen when Grizzly Bears and humans come into unwelcome battle. Not conflict - battle, don't whitewash it. A life and death battle. And not if - but when - inevitably. At some point in time the public will no longer remember or recognize these few agency persons names. But these few persons will undoubtedly learn and know when such a tragedy happens and then that burden of guilt, that of the taking of a life will and must befall their conscience because they themselves yielded that hand that ultimately resulted in the deed. Whereas Alternative A alleviates any such guilt by expressly allows for Grizzlies to come into the NCE of their own volition, thereby (eventually) achieving the same stated goal as per the proposed action.

"If the only tool you have is a hammer, you tend to see every problem as a nail." Given the background data and the job titles of those NPS and NFWS persons involved with the proposed action common sense informs that a strong bias of a predetermined result already existed from their beginning involvement. There is no surprise here: one's training and education preempts what might be other thoughts and outcomes. Then too, jobs and aspirational achievement are otherwise at risk. Perhaps in the process of this Draft EIS review the preferred alternative C might be jettisoned and the available Alternative A - No Action option be miraculously selected. Some commentators will be vindicated, others dashed. But the upshot will be that the general public can be deeply grateful that the method/purpose of the Draft EIS is both valid and viable. That the review process can actually spawn a valid reassessment, perhaps even an abrupt change. Let us not forget that the conjuring of several alternatives is to be a real opportunity for the consideration of a change. Not a rubber stamp on what far too often is simply a predetermined outcome. On the other hand, if no changes occur following the submitted comments the public will never know if, if not, or to what degree the biases of those few NPS and NFWS individuals dominated start to finish.

To me, how sad it is that so much effort and funding has and is being proposed to accomplish an action that has dubious goals. Especially when by honestly naming and identifying the action as 'Nonessential' we know that always limited resources might have been applied elsewhere. When in my backcountry travels I am constantly reminded of two important aspects of our public areas: What a great asset has been developed over a long period of time: that of the building and maintaining of trails and wilderness accommodations. What a great amount of maintenance of these assets is required: resurrection of lost trails as well as annual restoration work. An amazing amount of hard physical labor is necessary to provide the resources for people to access and enjoy the wilderness. People, don't let the perfect be the enemy of the good. Don't wish for a perfect (but nonessential) biodiverse wilderness. Let's just pay to keep and maintain the good wilderness access we already have.

Correspondence: I would not feel safe hiking with my kids knowing grizzlies are out there in the north cascades. That experienced hiking couple in Banff emptied a whole can of bear spray and they were still mauled to death. Grizzlies are thriving in yellowstone, and protected there. The species won't be lost since they have sanctuaries there, Canada and Alaska. I think proponents for bringing grizzlies back need to prove that the benefits outweigh the risk. Right now there are zero deaths from mauled grizzlies, those who vote to bring them back will have that blood on their hands for those rare cases humans do get attacked. For the same reason we dont bring back poison ivy after we've removed them from a public park-- let's leave the existing grizzlies alone and out of Washington. Thank you.

Correspondence: Regarding reintroduction of grizzly bears in the Northern Cascades of Washington:

While being an east coast resident the last many years, I've lived over 30 years in the West. I've seen one grizzly bear on the shores of Glacier Lake in Montana while I was in a boat. Not even close. I've also seen many black and brown bears during my time in the West. However, when it comes to Grizzlies, they're an undeniable death machine with humans.

To advise "playing dead" when confronted with a bear this size is a 50/50 gamble most humans don't want to take. The fact there would be restrictions on shooting the animal if attacked leaves one no where to go. Yes, this region is currently wild, but there is human activity. Native Americans hunted these bears in the past, and would likely hunt them

again. So, if a non-native had to protect themselves from attack by killing a bear, I believe this should be considered essential to reintroduction.

Further, the smaller the number of Grizzly bears introduced, the better both for the safety of the bears and the humans.

Correspondence: I am against bring grizzlies back.

People who don't know what they are doing are out in the wilderness more than ever now. I think it will cause two things to occur: 1. More attacks will happen, causing harm to people and then much like just happened with the couple that was killed in Banff, then the grizzly will be killed. 2. I think more people (than I have already seen on the trails), will start bringing guys with them as protection, which does not actually make me feel safe to be around while out in nature.

Correspondence: I am writing in support of grizzly reintroduction in the North Cascades. As someone who has spent years working in the bush near grizzlies in Alaska, I think it is overblown the potential danger they bring. We should continue to work to bring greater balance to ecosystems we have undone, and having them be part of the landscape is an obvious first step.

Correspondence: The people that want to bring back grizzlies to the Cascades should have to live in the vicinity of the bear drops. Innocent citizens should not be endangered by a few people who have no idea what the results will be because animals are unpredictable and do not follow rules. Please consider the people that will be impacted before you turn loose apex predators into even sparsely populated areas. These are either food growing areas, or recreational areas where people are at their most vulnerable.

NO BEARS PLANTED IN WASHINGTON STATE, ANYWHERE.

Correspondence: Please reconsider the risk of loss of human life due to this reintroduction. There are millions of acres of grizzly territory in the United States and Canada. Regardless of the amount of education provided on bear safety, it is inevitable that there will be a grizzly bear on human attack in the park. I do not see a strong enough case on biodiversity to balance this tremendous risk out when there are existing black bears. This is coming just weeks after the Banff attack on two backpackers.

Correspondence: To whom it may concern,

I am writing to support the restoration of grizzly bears to the North Cascades Ecosystem, their historic range for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C but with needed changes to the proposed 10(j) rule. The proposal would bring up to 25 non-conflict grizzly bears - likely from Montana - into remote areas of the North Cascades over the next decade and manage them as an experimental population.

The proposed 10(j) rule as currently written fails to give grizzlies the best chance to succeed and is too permissible in allowing reintroduced bears to be killed.

Lethal removal of a grizzly bear should only be considered where there is a demonstrable threat to human safety, and, for non-immediate threats to human safety, only after non-lethal management options, including concerted use of conflict prevention methods, have been exhausted.

No grizzly bears should be hazed or relocated as a result of conflict with livestock unless demonstrable, repeated efforts have been made by the livestock producer to prevent such conflicts, using commonly-available techniques.

No grizzly bears should be killed on public lands as a result of livestock depredation.

Landowners/private citizens should not be given a permit, or otherwise authorized, to kill a grizzly bear.

No grizzly bear should be preemptively relocated if the bear is not a threat to human safety, particularly if the bear has not become habituated or food-conditioned, or when nonnatural foods/attractants have not been properly secured and made inaccessible to bears. Doing so acts as a disincentive for communities to employ conflict prevention measures, and increases the risk to the bear of injury or death from capture and relocation.

These changes are crucial in providing adequate protection for grizzly bears.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C and with appropriate changes to Section 10(j). Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Dear Mr. Thompson and Ms. Shultz,

We request you accept this comment on the proposed rule and Draft Environmental Impact Statement (DEIS) for the reintroduction of the grizzly bear in the North Cascades and hope you incorporate its content into the final rule. We are graduate students at the University of Colorado Boulder and are currently in an environmental decision making course, and have drafted this comment as part of this course. We request an extension of the comment period until December 8th, 2023 and that you view this comment as a place-holder until we are able to submit a final draft after receiving feedback from our professor. We chose to comment on this proposal in particular because this topic is important to us. In a world where many ecosystems are being destabilized by the climate crisis and there is an unprecedented rate of biodiversity loss, it is our responsibility as humans and as American citizens to ensure that we do everything in our power to help promote biodiversity and ecosystem functioning whenever we can. As is noted in the proposal, reintroduction of grizzly bears into the Northern Cascades has the potential to do that.

Introduction

We support the reintroduction of the grizzly bear to the Northern Cascades using the preferred alternative outlined in the DEIS. We stand with the 80% of Washington voters who support reintroduction efforts. We support this effort as the grizzly bears will help disease management and overall aid in restoring the ecosystem. However, we request that the National Parks Service (NPS) and Fish and Wildlife Service (FWS) make efforts to prevent as much human-bear conflict as possible. We also believe the agencies should engage in public outreach to educate the public that will be near the grizzly bears, and that the agencies engage in adaptive management of the grizzly bears after reintroduction. We also encourage the agencies to further address the impacts of the Forest Service not engaging in the reintroduction of the grizzly bears.

Grizzly Bears Have the Potential to Cause Ecological Benefits in the Northern Cascades Predator-Prey Relationships Can Aid in Disease Management

Chronic wasting disease (CWD) has been slowly spreading throughout the United States. This disease infects mule deer, white-tailed deer, elk, and moose. CWD is a prion disease spread through saliva, feces, velvet, urine, and infected carcasses. The spread is difficult to control and population control is frequently used to control the amount of infected individuals. CWD causes wasting and behavioral changes. There is evidence that predators target individuals with CWD. For instance, in a study conducted in Colorado, mountain lions were more likely to prey on mule deer with CWD than without. While this study found the impact of this selective predation on populations with CWD, there has been evidence that there is an impact when the predators are wolves. In models based on data from Yellowstone, it is predicted that when high rates of CWD occur in adults, wolves are more likely to select for individual adults with CWD.

Grizzly bears would likely contribute to decreasing the prevalence of CWD. Grizzly bears "are versatile yet relatively ill-equipped for cursorial predation." Demonstrated by the studies on mountain lions and wolves, predators select for easier prey. CWD causes behavior changes such as listlessness that make individuals with CWD easier to catch. The selection for sick

individuals would possibly decrease prevalence of CWD in animal populations. It is possible that grizzly bears could impact other types of disease prevalence in different species.

Other Benefits of Apex Predators in Ecosystems Include Balancing the Food Web

The reintroduction of an apex predator also benefits the ecosystem past disease mitigation in prey. Reintroducing an apex predator like the grizzly bear fills an ecological niche. Grizzly bears will help balance the ecosystem's food web. Without control of ungulates, woody plant species can suffer from overbrowsing. Predators control the population of ungulates, allowing recovery of the woody plant species. This predator-prey relationship repeats throughout the food web, helping sustainably manage the area. A study of grizzly bears in Yellowstone found that grizzly bears helped maintain natural equilibriums in the food web.

The EIS Should Consider Several Different Methods to Prevent Human-Bear Conflicts

We recognize that human-bear conflicts are a massive area of concern for NPS and FWS (the Services) as well as the people in and around the North Cascades Ecosystem (NCE) area. While grizzly bears can improve the area's ecosystem, their reintroduction should be done in a way that ensures human health and well-being as much as possible. Section 4(d) of the Endangered Species Act, which applies to 10(j) nonessential experimental population (NEP), states that "the Secretary shall issue such regulations as he deems necessary and advisable to provide for the conservation of such species." We believe that it is necessary and advisable for the Services to do everything in their power to minimize the risk the NEP poses to the people in the NCE Recovery Zone. We believe that by making sure the reintroduced grizzly bears do not get improperly acclimated to humans, the Services will reduce the amount of dangerous bear behavior that could potentially lead to the legal takings of grizzly bears by the Services and of private individuals. Furthermore, we believe that it is necessary and advisable that the Services do everything in their power to make people in and around the NCE Recovery Zone feel safe around the reintroduced grizzly bears to prevent any illegal takings before they happen. If any of the NEP is purposely killed, either legally or illegally, this will significantly slow down the population's conservation due to grizzly bear's slow reproduction time. The Services limited resources that have gone into the reintroduction efforts will be wasted. We believe the Service should be as proactive as possible in order to reduce the amount of purposeful takings of the NEP. Much of the opposition to this reintroduction is and has been from people who are worried about the safety of themselves, their loved ones, and potentially their livelihoods. These risks can be overblown and based on ignorance of how to reduce the risk of living alongside grizzly bears, but they are certainly not baseless. The Services should take these concerns into account and do everything in their power to alleviate the risk of the NEP while also reducing the overblown perception of risk. The Services should especially focus these efforts for landowners, recreationalists, and motorists.

Equipping landowners with resources and knowledge to minimize conflicts will support the successful reintroduction of grizzly bears.

Much opposition to the grizzly bear's reintroduction into the NCE comes from landowners who are concerned for not only their lives and safety, but also for their livelihoods, which are tied to their land. In particular, ranchers and other farmers are concerned that their livestock and livestock feed will be stolen by the reintroduced bears. This is a valid concern, one that the Services should take steps to alleviate. The Services should use the most up-to-date science to equip landowners with the resources and knowledge to minimize these risks.

Research has shown that one of the most effective ways to deter bears from non-natural attractants is through the use of electric fences. These fences offer an electric shock to anything that touches it. This shock is not enough to seriously harm a human or bear that touches it, but it is enough to deter bears from further attempts to get past it. Using fences to protect bear attractants like livestock, livestock feed, fruit trees, and garbage not only protects these attractants, it also prevents the bears from seeing humans and non-natural attractants as viable sources for food, reducing human-bear conflicts preemptively, potentially even for those without electric fences and throughout bear generations, as bears teach their young appropriate behaviors.

Electric fences need to be set up properly in order to be effective. They have to be at the right height and have the right voltage, tension, and grounding. Concerned ranchers inexperienced in using electric fencing would benefit from receiving technical assistance with both how and where to set up electric fencing to best secure their bear attractants. This would also be an opportunity to inform them about proper techniques to further reduce human-bear conflicts like the removal of bear attractants, namely deadstock as well as the proper monitoring of calving operations.

The Services should consider providing this technical assistance and education at the least. This is an opportunity to not only make sure that electric fences are set up in a way that effectively deters bears from attractants and proper attractant-removal

practices are being used, it also allows the Services to build trust with ranchers and other landowners and ensure that not only are their assets safe, but that they feel like their assets are safe, and that they are not being abandoned to face the threat of grizzly bears alone.

This can save the Services time and money in the long term in two key ways. First, it reduces the amount of complaints they have to respond to that result from human-bear conflicts. The most common source of call to the British Columbia Conservation Officer Service between 2014-2017 were from conflict resulting from unsecured access by grizzly bears to livestock, livestock feed, fruit trees and berries.¹¹ By proactively ensuring that these attractants are secure, the Services reduces the amount of time spent responding to conflicts after the fact, and potentially saving livestock, property, and human health/lives.

Building trust and ensuring that people feel secure living in/around the NCE Recovery Zone alongside the reintroduced bear population reduces lethal-takings from private landowners. When people feel threatened, they take matters into their own hands to secure their land and property, despite the final legality of those takings as determined by the Services and courts. By educating ranchers/landowners in best practices to reduce human-bear conflicts, the Services would help further promote the conservation of the population by reducing lethal-takings. In turn, this would help reduce the amount to restock the Services would have to provide to ensure that the population remains stable.

While providing technical assistance and education is a good start to reducing human-bear conflict for landowners, providing the electrical fencing itself is an even better way of doing this. Providing technical assistance and education alone still leaves it up to the individual property owners to ensure that this assistance and education is put to use, potentially leaving major gaps in implementation. This is potentially enough to make the educational assistance pointless in actually reducing human-bear conflicts. Landowners against the reintroduction of grizzly bears will potentially see these efforts as the government telling them what to do after introducing a new threat to their livelihoods. By providing bear deterrents such as electric fencing, the Services can work with landowners to ensure that this assistance is put to use and fences are established properly. It gives landowners a reason to trust the Services and alleviate the feeling of one-sidedness many people feel when faced against government action.

The Services should also consider providing other forms of bear deterrents such as bear-spray and livestock guard dogs. While electric fences have been shown to be the most effective bear deterrents, they are not always applicable for certain landowners. Bear spray is effective for personal protection (see more under "Recreationalists"), and livestock guard dogs would be effective for those whose land is too large or otherwise difficult to fully fence-in. It is useful for herders who frequently move their livestock across large distances.

It is the Services who are re-introducing the threat of bear-attacks to these landowners, so it should be the Service's responsibility to make sure that these threats are mitigated as much as possible. By providing not only technical assistance and education to landowners, but also material assistance in the form of various bear deterrents specific to the individual landowners, the Services can ensure that the process of re-introduction does as well as possible for the bears and the landowners involved. At the very least, the Services can promote the financial assistance provided by organizations such as Defenders of Wildlife, which will provide up to \$500 of fencing used to secure bear attractants. The Interagency Grizzly Bear Committee (IGBC) should pool the resources of the different agencies within it to come up with a full gambit of financial and material assistance they can provide to landowners to completely cover the cost of bear security for those living in and around the NCE Recovery Zone.

The Services can best ensure that this assistance gets used by regularly (annually) hosting informational sessions where landowners can be informed of the assistance the Services are offering and sign up to receive them. The Services should reach out to landowners who do not attend these informational sessions directly, potentially in-person and leaving flyers if necessary with relevant information for signing up for these services. The Services should start with property that is closest to the area where grizzly bears are likely to be based on where they are reintroduced and expand outward from there. The Service's outreach efforts should occur where evidence indicates the bears are located. If the bears move to unexpected locations, the Services' outreach efforts should shift appropriately. What is most important is ensuring the safety of people, bears, and securing the attractants that bring them into conflict, and the Services should do everything within their power to do so as a means to promote the conservation of the population. Evidence shows that community and evidence-based efforts like these can reduce the number of human-bear conflicts and increase the feeling of security for those involved.

Recreationalists will need support to keep themselves safe in the Recovery Zone.

Similarly, recreationalists should also be equipped with everything they need to keep themselves safe from bear attacks while in and around the NCE Recovery Zone. Even though the chances of recreationalists encountering a bear will be low, especially in the early years when there will be very few grizzly bears in the NCE Recovery Zone, the Services should do everything in their power to minimize the chances of human-bear conflicts to ensure the safety of recreators and the continued conservation of bears.

Bear Spray

The science suggests that one of the most effective ways to minimize personal risk around grizzly bears is the proper use of bear spray. Bear spray is an aerosol product comprised of 1-2% capsaicin and related capsaicinoids that is sprayed as a cloud from a pressurized canister at speeds greater than 100 km/h. 92% of people carrying bear spray were uninjured by bears in close-range encounters. The Services should ensure that all recreationalists hiking, camping, and hunting in areas with reintroduced bear populations should have access to and proper knowledge of the use of bear spray.

Bear spray should be distributed, free-of-charge, to hikers and campers utilizing Parks within the NCE Recovery Zone as much as possible. For example, in North Cascades National Park, at some point in the process of making reservations and/or paying fees for camping/backpacking, campers and hikers should be asked if they are currently in possession of bear spray. If they do not, they should be encouraged to take some. Bear spray should be left at registration kiosks. Or, when Park workers check on camper/backpackers to ensure that they have permits and have paid the fees, they also check that the recreators have bear spray and distribute them if they do not. However it would best fit into the Parks Service current operations, they should ensure that as many recreators have bear spray as possible, especially for long-term/overnight recreators. They should potentially all have two as is recommended by the IGBC.

The point of distribution should also be the point of education on the proper use of bear spray. Recreators should understand the difference between bear spray and pepper spray and that pepper spray should not be used in place of bear spray. They should understand that bear spray should not be carried in a backpack but should instead be carried on a hip or chest holster for easy access. It should also not be sprayed on the ground or on tents as that can actually attract bears. And they should understand how to properly deploy their bear spray if necessary, perhaps using an inert bear spray canister as practice (The Services could provide demonstrations and practice as a part of their educational efforts, making it fun and memorable). Even if recreators already have bear spray, they should be reminded of its proper use. They should also be encouraged to double check that their bear spray is not expired and be given another canister if it is. An important part of education is context. Recreators should be made aware of the NEP status of the grizzly bear and the Services conservation efforts, and the importance of the bears having negative associations with humans to prevent future attacks.

Recreators should also be made aware that bear spray successfully stops negative human-bear encounters at a greater rate than firearms. Guns help people, especially hunters, feel safe, in this case a false sense of security. Reminding people that their safety is more important than their pride and machismo can save lives, both of the humans and of the bears. As well as the current practice of informing hunters of the illegality of purposefully taking a bear and testing hunters to make sure they can correctly identify a black bear as opposed to a grizzly bear, the Services should also make identity-based appeals that will actually resonate with hunters and other firearm carriers. Appeals from other hunters, especially those who have survived bear attacks have the potential to be very effective. Idaho-based hunting guide Bob Legasa, who survived a grizzly bear attack, warns that "a gunshot is like a dinner bell for grizzly bears". Hunters, and people who interact with hunters a lot, will understand what will appeal to other hunters to convince them that their gun is not the most effective to stay safe in areas with grizzly bears.

Avoidance

While equipping recreators with bear spray and ensuring they are able and willing to use it is important in helping them stay safe during human-bear conflicts, helping recreators avoid bears altogether is the surest way to maintain safety. We appreciate the efforts the NPS and USFS are taking to promote the use of proper food storage and reduce unsecured attractants. However, the Services can further through education and potentially seasonal closures during hyperphagia.

As noted in the proposed action, the IGBC already has efforts in place to inform the public of the dangers of bears via signage, but there are other steps the Services can take to promote bear avoidance through education. Campers, backpackers, hunters and other long-term recreators could watch a video, or attend a class of a worker of one of the Services, to receive

their permits and/or pay their fees. In cases where educational efforts like these are used, the Services should work with outdoor educational experts to create a curriculum and teaching method that is evidence-based to make sure the classes or videos are maximally effective.

In the proposed action, the only closures that are mentioned are short closures for hours or days as needed. We understand that the Services want to limit the impact the grizzly bear reintroduction has on tourism and the people who depend on it. However, we believe the Services should leave the option open for annual closures during the grizzly bears' hyperphagia phase. Hyperphagia is the drive in bears that increases their feeding activity both before and after hibernation. Seasonal and annual deficits of natural foods are the best predictors of nuisance activity in bears. The Services' policies on closures should reflect this. If nuisances and closures during hyperphagia being too common, it might be less disruptive to tourists and the tourism industry to have regular annual closures rather than ad hoc ones. This would allow for people to plan their trips to the NCE while taking hyperphagia and bear activity into account.

Motorists pose a risk to grizzly bears and steps should be taken to avoid vehicle collisions.

As stated in the proposed rule, "Because road access was identified by the IGBC as one of the most imminent threats to grizzly bears, the recovery plan recommended that road management be given the highest priority for grizzly bear recovery." We whole-heartedly agree. Human-bear conflicts in the form of vehicle collisions are much harder to mitigate through education and awareness than the other forms of human-bear conflict that has been mentioned so far. The physical infrastructure of the road has to change in order to reduce the amount of premature fatalities at the hand of vehicle collisions. Fortunately, not only are there road changes that can be made to help prevent these collisions, there are federal resources outside of the Services already constrained resources available to help alleviate this problem.

Wildlife crossing structures have been shown to be an effective means of preventing vehicle collisions with grizzly bears. These structures usually take the form of underpasses or overpasses that allow wildlife to cross roads without putting themselves or vehicles at risk of collision. We recognize that these structures can be costly and disruptive to the local ecosystem to build into pre-existing roads. We believe the Services should work with the U.S. Department of Transportation (DOT) as well as the Washington Department of

Transportation to expand the use of these structures as much as possible across the state and specifically in and around the NCE Recovery Zone as a way to further the Services broader conservation goals, including the conservation of the NEP. For this rule in particular, we believe that the Services should incorporate wildlife crossings into their "no-net-loss of core" approach to road construction. As the draft rule proposal states, "[The no-net-loss] approach indicates that if a road is constructed or opened to motorized travel, another road must be closed to motorized use in order to maintain core habitat." We believe that in addition to closing a road when a new one is opened, that new road should be constructed or retrofitted with wildlife crossing structures utilizing the best available science and observations. The current best science, as described by Ford et al. for wildlife crossings as it relates to grizzly bear conservation that takes cost into account, involves a combination of wide open-span bridges for mothers with cubs and box culverts as a cost-effective way to support singletons (that is, nonbreeding adults). This is effective because it optimizes the behavioral ecology and demographic connectivity of grizzly bears. The box culverts allow singletons to avoid families, which helps reduce intraspecies killings. The open-span bridges allow for families to easily use wildlife crossing, which is a lesson mothers can pass on to cubs, reducing the "learning curve" of bears figuring out how to use wildlife crossing structures.

There are many co-benefits to wildlife crossing structures beyond grizzly bear conservation, including conservation of other species that are often the victim of wildlife-vehicle collisions, as well as economic costs to motorists and human lives, and as mentioned earlier the Services should consider expanding the use of wildlife crossings throughout their operations, especially in the NCE. They should incorporate wildlife crossings into their current "no-net-loss" approach to roads within the NCE Recovery Zone.

Congress and the U.S. DOT agree that wildlife crossing structures are a viable way to reduce wildlife-vehicle collisions, which is why they have established the Wildlife Crossings Pilot Program (WCPP) as part of the Infrastructure Investment and Jobs Act of 2021. This program allows the DOT, through the Federal Highway Administration, to award \$350 million total in Federal-aid for Federal Fiscal Years 2022 through 2026. Eligible entities to receive this award include: State Departments of Transportation, units of local government, regional transportation authorities, Indian tribes, federal land management agencies, and a group of any other eligible entities. We recommend that the Services apply to receive this funding for wildlife crossing. We also recommend they use the consultation and collaboration processes that are a part of this recovery plan to coordinate with other federal and local entities to try and get as much of this award into the NCE Recovery Zone as possible.

Less than 3 years is not a long time to plan and develop wildlife crossings, and even though the Services should try to be a part of the WCPP, there are other steps the Services can take to promote the use of wildlife crossings in the NCE Recovery Zone. Namely, the Services and other members of the IGBC should encourage the U.S. DOT to join the IGBC. If "road access was identified by the IGBC as one of the most imminent threats to grizzly bears" and, according to their charter, the purpose of the IGBC is "To coordinate grizzly bear policy, planning, management, research, and communication activities of state, provincial, tribal, and federal agencies to ensure the best utilization of available resources" it makes sense that the federal agency most responsible for road access and construction should be officially a part of the committees conservation efforts. As a member of the IGBC, the DOT would be able to keep the other agencies up to date on future DOT efforts to promote wildlife crossings, as well as providing advice on other ways roads on agency lands can be used to promote the conservation of grizzly bears.

Effective Public Outreach Requires Relationships to be Built

Public outreach is incredibly important when implementing a potentially controversial regulation. Human relationships with grizzly bears have been fraught at times, causing the need for grizzly bears to be reintroduced into the Northern Cascades. Already, the public has participated in the earlier Draft EIS in 2014. The 2014 public comments were considered in the formation of the current Draft EIS. Public scoping also included the interested public early in this process. We would recommend further public involvement to streamline the acceptance of grizzly bears.

As FWS and NPS begin to reintroduce grizzly bears, the agencies can host town halls. Town halls provide the public the opportunity to make comments to officials and express their concerns. The agencies can then respond in real time to the comments and concerns of the public. Town halls help build trust with the agency if the officials respond in a meaningful manner. Open houses should be avoided as these do not provide the agencies and public opportunity to meaningfully interact. Open houses are beneficial to inform the public, but not an opportunity for an exchange of ideas and information.

To increase safety of recreationists, education to differentiate between bear types should occur. To achieve this, a permit should be issued to camp and to backpack in the backcountry. Before a permit is issued, the permit holder must complete a test on their ability to differentiate between bear types. This would be similar to the Washington Department of Fish and Wildlife (WDFW) permit required for hunters. If completing a test still fails to increase the safety of recreationists, the permit should include a course and then a test. The effectiveness should be evaluated.

To prevent conflicts, public outreach will be important in towns near grizzly bear populations. This will be especially important in Zone 3. Town halls should be offered to exchange ideas about effective bear safe regulations. Also, signage should be included on trash receptacles. Open houses would be beneficial for educational outreach.

In the Draft EIS, the agencies place some of the responsibilities on nonprofit organizations. The agencies expect the organizations will likely continue outreach about safety concerns, provide information about grizzly bears, and policies and regulations in the recovery process. This reliance on nonprofit organizations is problematic. The Draft EIS does not indicate that this reliance is official. Placing this responsibility on nonprofit organizations without communication will likely leave gaps in public outreach. Nonprofit organizations will need to devote resources to public outreach on grizzly bears where otherwise the resources may have gone towards other projects. The agencies should contact nonprofit organizations to develop relationships. As these relationships develop, both agencies and organizations should discuss what public outreach needs to occur. This should be evaluated frequently and the agencies and organizations should discuss which group would be best for delivering the information.

Adaptive Management Improves the Success of Management Goals

Adaptive management allows agencies to learn while they implement various projects and adapt to changing circumstances. Adaptation should be science-based and use the up-to-date science and methods. It also requires monitoring, assessment, and recalibration. To determine if the management objective is being achieved, there needs to be accurate baseline data as well as SMART criteria. SMART stands for specific, measurable, attainable, relevant, and time-sensitive. This criteria should inform the management goals and the intermittent goals. Adaptive management also removes the need for a repeat of the NEPA process unless circumstances change in an extreme manner.

The metrics put forth in the EIS are good metrics. However, other potential metrics include the human population's feelings

of safety near bear habitat, the geographic spread of the reintroduced population, and interactions between different populations of grizzly bears. The Draft EIS should address how the agencies plan to gather quality baseline data for the metrics chosen. The EIS should also describe how the metrics included relate to monitoring the success of the bears. The management goals are outlined well in Draft EIS. However, the steps for adaptive management are largely limited to releasing additional grizzly bears to compensate for mortality, genetic limitations, population distribution, and sex ratio. This lack of flexibility is inconsistent with adaptive management as it will not address the root issues causing the need for more bears.

Already, one potential impact that will require adaptive management is salmon poison disease. While the EIS states that populations where berries are the main food source would be the most likely source populations, it does not rule out populations dependent on salmon. An encysted fluke causes this disease and occurs in salmon in lower latitudes. If the source population has not been exposed to this fluke, the bears could become sick and lower the success of the population. In this example, simply releasing more bears would not address the issue. However, carefully choosing bears to release and developing preventative measures would.

Human actions also have potential to affect recovery, requiring adaptive management to occur.

Ranching

Under the current EIS, ranchers will be compensated for depredation of livestock. The EIS also prevents releases near the grazing allotments. However, should bears find ranches to be easy food sources or attractive for other reasons, adaptive management would be an appropriate response. An adaptive response could include new deterrents or new release areas further away from the ranches. It could also include increases to compensation to disincentivize the take of grizzly bears without the intervention of federal or state government.

Logging

Logging has been on the decline in recent years. However, with the uptick in wildfires, timber harvest may be used as a mitigation measure. The EIS predicts minimal conflict between logging and bears. The populations would likely avoid timber operations as they avoid humans according to the EIS. However, should the prediction not be accurate as logging activities may also present opportunities for easy food, the methods to avoid conflict will need to change. Perhaps permits for timber harvest should no longer be issued near grizzly bear habitat. Roads need to be built for logging, although an agreement between agencies prevents the decrease of any habitat for grizzly bears thus requiring another road to close. The new road still creates an opportunity for vehicle collisions. Should these activities prevent a successful population from growing, it may be necessary to decrease logging in the area.

Recreation

Recreation may increase or decrease depending on the public's feelings about the grizzly bears. Some may want to see grizzly bears in their natural habitat and others may want to avoid the grizzly bears. Conflicts occur more frequently when there are items such as food and trash that attract bears closer to humans. The conflicts could impact bear recovery due to the removal of problem bears. These bears would need to be relocated or euthanized to prevent deadly conflicts with humans. Adaptive management would be beneficial here to prevent conflict with humans for future bears. Some of the possible solutions could be more education for recreationists, different release sites for bears, or closures throughout the year.

Impacts of Action Without the U.S. Forest Service Should be Addressed in the EIS

As put forth in the Draft EIS, the reintroduction of grizzly bears to the Northern Cascades originally included the U.S. Forest Service (USFS), but USFS has decided to prioritize other objectives. Currently, USFS has not started working towards approval to allow grizzly bear reintroduction of USFS lands. As the process has not started, the reintroduction would be limited to NPS lands. The Draft EIS, past stating the reintroduction would be limited to NPS lands, does not discuss the consequences of eliminating USFS lands. The Draft EIS assumes access to USFS lands. By limiting the reintroduction to NPS land, the bears will be closer to each other. It also would limit the habitat the bears would have access to. It could also change the protection experienced by the bears if they were to leave NPS lands. Areas of USFS land are not equipped for grizzly bear reintroduction as well. For instance, as noted in the Draft EIS on page 25, "[t]he Okanogan-Wenatchee NF does not have food storage restrictions." The lack of regulations could lead to human-bear conflict if the USFS does not take action to prepare for grizzly bear reintroduction.

We request that the agencies take a hard look at the consequences of elimination of USFS participation in the current plan for reintroduction. The analysis should include impacts on human-bear conflict, geographic spread of the bears, and the impacts of the protection the bears would experience. The analysis should also include impacts to adaptive management strategies to human conflicts on USFS land. Depending on the outcome of the analysis, it is possible that the section 10(j) designation

should be reconsidered.

Conclusion

We respectfully request that the agency consider the following items before issuing the final rule and EIS.

Methods for preventing human-bear conflicts

Landowners

Provide information and knowledge to landowners.

Provide electric fencing or dogs to prevent bears from entering the land.

Recreationalists

Provide education on bear safety.

Provide bear spray and teach avoidance.

Motorists

Create wildlife crossings to allow safe crossing for grizzly bears.

Public outreach

Meaningful engagement

Town halls

Educational outreach

Relationships with nonprofits to help agencies with continuing outreach.

Adaptive management

Adopt SMART criteria to evaluate the effectiveness of current methods and adapt to changing circumstances.

Consider human activities that may impact recovery and decide if limiting these activities would be beneficial.

Ranching

Logging

Recreation

Partnership with USFS

Provide detailed analysis of the possible impacts on grizzly bear reintroduction.

We thank you for spending the time to read our comment and consider the options we have laid out here. We hope you incorporate at least some of our suggestions into the final rule. Most of all, we hope for the successful reintroduction of grizzly bears into the NCE, and a more sustainable, ecologically-friendly world for all.

Correspondence: Please consider my thoughts and comments as a family with roots in the Methow Valley and a deep passion and care for the North Cascades Ecosystem. My wife and I hope to one day call the valley our home, and with family in the area believe it is one of the most important places to us and our four children on earth.

We enjoy the outdoors in many ways, hiking, fishing, hunting, skiing, cycling and anything that allows us to enjoy the natural

and unique beauty of the North Cascades.

I was saddened to read an EIS which has logical fallacies and even borders on data manipulation in order to conclude what many (who may not even be impacted directly by this decision) want to happen. The EIS attempts to compare other areas and systems that do not relate closely enough to the ecosystem and human population of the North Cascades to make any thoughtful conclusions. Grizzlies are amazing creatures, but should not be considered above and beyond the current fauna, flora and human population.

Please make the decision to "do nothing" and allow for the natural migration of grizzlies from the large and healthy population of them just north of this precious ecosystem. (That have not naturally made the decision to call the NCE their home). If for no other reason then to allow time to further study the need and viability for us to purposely manipulate this process.

Correspondence: I am a resident of Rockport, WA writing to relevant parties in favor of Grizzly Bear Restoration in the North Cascades Ecosystem under Alternative C. Grizzlies are a critical part of this ecosystem and deserve active management in their return to the region. However, I am concerned that the management of human communities in bear country could be the source of ongoing human-human and human-bear conflict if not planned for appropriately.

Living previously in the Greater Yellowstone Ecosystem, I've seen first hand ways that bears can thrive and also struggle on the margins of large tracts of public land. Where I lived in Wyoming, many locals were supportive or at least resigned to the reality of a growing population of brown bears on the landscape. This led to a participatory and generally compliant citizenry willing to take additional measures and precautions to mitigate ursine conflict. Based on my experience during some of the public listening sessions for this EIS and from conversations with neighbors, I am deeply concerned about public buy-in for any measures to reduce human-bear conflict should bears return to our area.

Please consider the following questions in the final decision about grizzlies in the North Cascades:

What funding and personnel exist to support bear safe infrastructure (ex: bear proof residential trash bins)? What funding and personnel exist to support education on bear mitigation measures for local industries (ex: livestock protection best practice)? What funding and personnel exist to support public outreach on how to recreate safely in bear country (ex: signage at

trailheads)?

Who will be the messenger of any bear interaction messaging for local communities? How will this person generate rapport and trust with locals?

What role will local tribal communities and first nations have in the management of bear populations? Will there be avenues for co-management if interest is expressed by local tribal nations?

Correspondence: Regarding the Grizzly Bear Restoration Plan:

It is with great frustration and sadness that I have to write this again. This 'plan' is as ludicrous now as it was just a few short years ago. (I guess with Biden as Pres. and Covid going on, it was a good time to try and push your agenda through again...is it 'Agenda 21' or 'Biodiversity' now??? I can't keep them straight.)

Your EIS is still one-sided and delusional, with the same great phrases such as 'tools' and 'educate' and 'enforcement'. Your 'public hearings' are still a farce.

I have no desire to be 'educated' on how to co-exist with grizzly bears...No gardens, no compost, no greenhouse, no bees, no birdfeeders, no animals. Oh, and no walks... (lest I have to prove that I was not the 'aggressor' when I shot a grizzly to save my life.) My property will not be 'core grizzly habitat', while I am alive.

It is still obvious that you couldn't care less about the thousands of people who live in the towns and villages between Sedro-Woolley and Winthrop, Darrington...the towns and residences and schools and businesses that you conveniently leave off of your 'maps'. SHAME ON YOU! (Good luck to the kids waiting for a school bus, with a snack lunch!)

You say that the bears you're proposing to bring to the area will have plenty of nuts and berries to eat (even in times of drought and wildfires)...and that they will be 'educated' not to eat meat, fish, or follow the rivers down for more salmon...

PLEASE STOP INSULTING PEOPLES' INTELLIGENCE!

'NON-ESSENTIAL AND EXPERIMENTAL' SHOULD SAY IT ALL...BUT SINCE COMMON SENSE IS NOT YOUR PRIORITY...

I VOTE 'DO NOTHING' OPTION, AGAIN.

Correspondence: I prefer Alternative A: No Action.

If the bears return across the border on their own, so be it. At this time, I do not see that adding up to 200 bears to a North American population of approximately 60,000 bears will make a critical difference. The EIS talks about a low number in the

lower 48 states but not overall.

In addition, Washington state has 7.785 million people. That has grown from 2.8 million in 1960. Washington has 3.4 million more people than Alaska, Idaho, Montana, and Wyoming combined. Washington has a population that recreates in the Cascade Mountains north of Snoqualmie Pass daily and very heavily in the summer. The chances of human/bear interactions seems much higher than in vastly lesser populated areas. Tourists can go to Galcier and Yellowstone Parks and be in grizzly bear territory if they desire. Recreationists in Washington state will not be able to stay home and avoid them.

I realize that the number of bears in Washington will be relatively low. Hopefully, if we have 200 bears in the future few humans or bears will die if and when they meet. At this time I do not see the need to inject a very large and powerful apex predator into a very highly populated area.

Correspondence: I DO NOT support reintroducing grizzly bears to the North Cascades.

Other species have been living and people have been recreating in the area for years without grizzlies. "Because they used to live here" is not sufficient reason to re-introduce an apex predator. Inexperienced or unprepared people are not the only ones who can be hurt by Grizzlies. People will certainly die as a result if this effort prevails.

Correspondence: To whom it may concern,

I am writing to support the restoration of grizzly bears to the North Cascades Ecosystem, their historic range for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C but with needed changes to the proposed 10(j) rule. The proposal would bring up to 25 non-conflict grizzly bears - likely from Montana - into remote areas of the North Cascades over the next decade and manage them as an experimental population.

The proposed 10(j) rule as currently written fails to give grizzlies the best chance to succeed and is too permissible in allowing reintroduced bears to be killed.

Lethal removal of a grizzly bear should only be considered where there is a demonstrable threat to human safety, and, for non-immediate threats to human safety, only after non-lethal management options, including concerted use of conflict prevention methods, have been exhausted.

No grizzly bears should be hazed or relocated as a result of conflict with livestock unless demonstrable, repeated efforts have been made by the livestock producer to prevent such conflicts, using commonly-available techniques.

No grizzly bears should be killed on public lands as a result of livestock depredation.

Landowners/private citizens should not be given a permit, or otherwise authorized, to kill a grizzly bear.

No grizzly bear should be preemptively relocated if the bear is not a threat to human safety, particularly if the bear has not become habituated or food-conditioned, or when non-natural foods/attractants have not been properly secured and made inaccessible to bears. Doing so acts as a disincentive for communities to employ conflict prevention measures, and increases the risk to the bear of injury or death from capture and relocation.

These changes are crucial in providing adequate protection for grizzly bears.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in

the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C and with appropriate changes to Section 10(j). Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Correspondence: Thank you for this opportunity to comment on restoration of the Grizzly Bears to the North Cascades. Contrary to the what Representative Newhouse keeps saying, I am a resident of central WA and firmly believe that grizzly bears should be restored to the North Cascades. I support Alternative C and the proposal to bring up to 25 grizzly bears into the North Cascades. I would also like to see changes made to the proposed 10(j) rule because I am concerned the proposed 10(j) rule as written is too permissible in allowing reintroduced bears to be killed.

Lethal removal of a grizzly bear is allowable when there is a real demonstrable threat to a person's safety. I am concerned that grizzly bears may be killed due to livestock conflict on public lands, I do not think that should be allowed. No landowners or private citizens should be given a permit to kill a grizzly bear.

The counties surrounding the grizzly bear reintroduction should begin the use of something equivalent to a Bear Smart program to help minimize the chance of grizzly bears become habituated to garbage.

Correspondence: Thank you for this opportunity to comment on the: Draft Grizzly Bear Restoration Plan / Environmental Impact Statement for the North Cascades Ecosystem

As a member of Back Country Horsemen of Washington, I am very concerned with the ability to continue to recreate in the North Cascades should a small population of heavily protected grizzly bears be mechanically moved into the region that we recreate in. The DEIS does not sufficiently analyze the impact to recreation or present any options for how trails can be maintained open in the presence of protections implemented to reduce human-grizzly interactions.

1. The Pacific Crest National Scenic Trail runs through the core habitat and has permitted distance hikers of around 10,000. When considering the other trail users in and along the North Cascades Ecosystem (NCE) since this is one of the most populated areas around any bear

ecosystem, the use likely exceeds a quarter million visits. However, the DEIS indicates that the use is insignificant. It is very significant and will likely result in many human-bear interactions.

2. The Pacific Northwest National Scenic Trail also runs through the NCE as well as other bear ecosystems to the east, including the Cabinet-Yaak (CYE). The CYE has a more established population of bears but still has resulted in challenges to the very existence of the trail due to the limited number of bears in the CYE (20-40). Opposition to the National Scenic Trail in the recovering bear population area as well as the connecting landscapes between ecosystems has also been expressed by USFWS staff, the same agency putting forth the NCE proposal through which the same trail will pass.

3. Without a more detailed analysis of how to retain the carrying capacity of the trails, trailheads, and campgrounds without resulting in long-term or permanent closures, there is no way to effectively review this DEIS.

4. Furthermore, the NPS and USFWS have pointed out that the Canadian counterparts and First Nations are preparing to release grizzly bears in the northern part of the NCE. IF that was the only release point, it would move the core recovery/release area north and away from the more densely human-populated areas of Washington State. It also would be in line with Washington State law as well since no bears would be translocated directly into Washington, and there also would be predictability on how many bears are being moved into the entire NCE which overlaps both countries. The BC government has noted that its Recovery Plan is being developed jointly with the USFWS even though this US EIS only addresses the Washington effort.

5. As a trail horse rider in the NCE, I ask that the No Action Alternative be selected. The areas we ride in include the Mt Baker Snoqualmie National Forest, the Okanogan Wenatchee National Forest including the Pasayten Wilderness, and the North Cascades National Park. We have many horse camps along the boundary of the NCE. We cannot support either Action Alternative without more substantive analysis on impacts on recreation as well as knowing more on the joint planning with Canadian counterparts.

Correspondence: After study there are several weaknesses in the preferred Alternative C that should be rectified and that make Alternative B a method more likely to promptly result in repopulation of the grizzly bear to the NCE. Alternative C compromises recovery by allowing takes in a lax, less restrictive manner. An unintentional "take" during black bear hunting season, even if repeated during several seasons by an individual hunter might be forced to go unsanctioned. Recovery efforts of the Gray Wolf in NE Washington have been plagued by depredation complaints, the majority of which come from a very small number of gray wolf recovery opponents. Is there a reason to repeat this mistake in a recovery plan? Alternative C also gives weight to the economic interests of mining and forest harvesting that are destructive to the essential habitat of this threatened species. There is no good science or evidence that promoting the interests of extractive industries promotes recovery of a threatened species. The lower requirements for consultation in Alternative C also do not do the better job of helping the threatened grizzly bear recover in the NCE or its natural range in Washington State. By creating the expansive management zones of Zone 2 and 3 that encompass all of WA state outside the Selkirk Ecosystem the preferred Alternative C, without science or evidence to support it and by a fait accompli removes the grizzly bear's threatened species designation from vast areas of potential habitat in Washington state. This would include such areas as all NPS and NFS lands south of Interstate 90 including Mount Rainier NP, the Goat Rocks Wilderness, the W.O. Douglas Wilderness, Mount Adams Wilderness, and lands on the Olympic Peninsula including the vast wilderness lands of Olympic NF and Olympic NF For these reasons and given statements in the draft EIS referencing socioeconomics and prioritizing these concerns at the same level as grizzly bear recovery the preferred Alternative C should not be adopted and Alternative B should be accepted and adopted.
Respectfully,
[REDACTED]
Olympia, WA

Correspondence: To whom it may concern,

I am writing to support the restoration of grizzly bears to the North Cascades Ecosystem, their historic range for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C but with needed changes to the proposed 10(j) rule. The proposal would bring up to 25 non-conflict grizzly bears - likely from Montana - into remote areas of the North Cascades over the next decade and manage them as an experimental population.

The proposed 10(j) rule as currently written fails to give grizzlies the best chance to succeed and is too permissible in allowing reintroduced bears to be killed.

Lethal removal of a grizzly bear should only be considered where there is a demonstrable threat to human safety, and, for non-immediate threats to human safety, only after non-lethal management options, including concerted use of conflict prevention methods, have been exhausted.

No grizzly bears should be hazed or relocated as a result of conflict with livestock unless demonstrable, repeated efforts have been made by the livestock producer to prevent such conflicts, using commonly-available techniques.

No grizzly bears should be killed on public lands as a result of livestock depredation.

Landowners/private citizens should not be given a permit, or otherwise authorized, to kill a grizzly bear.

No grizzly bear should be preemptively relocated if the bear is not a threat to human safety, particularly if the bear has not become habituated or food-conditioned, or when nonnatural foods/attractants have not been properly secured and made inaccessible to bears. Doing so acts as a disincentive for communities to employ conflict prevention measures, and increases the risk to the bear of injury or death from capture and relocation.

These changes are crucial in providing adequate protection for grizzly bears.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C and with appropriate changes to Section 10(j). Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Correspondence: Although Grizzly bears are beautiful creatures, I do not feel they should be brought to the Pacific North West. So my vote is for alternative A (do nothing, do not bring grizzly's here). Our national forest is a host to many different types of recreation in all 4 seasons. If Grizzly bears were brought back, they could cause a real threat to the people who recreate in our national forest. The Grizzly is a real danger to people's safety. I am then afraid if this happens that it would give the government reason to shut down the national forest to the people. The people whose tax dollars pay for its maintenance. If closures were to happen this would create a ripple effect that would harm the local communities. There are many small mountain communities that rely to the people who recreate in the mountains. They're tourist towns and if the tourist who come there to recreate no longer come due to the Forrest being shut down, due to Grizzly bears, than you will harm the people's lively hood.

Correspondence: Hello! Thank you for your time. I want to say that I strongly disagree with grizzly bears being considered for the North Cascades ecosystem. I hope that you will listen to the everyday people that this decision will impact. I'm a mom with two young children and I am so excited that they are finally getting old enough to explore the beauty, splendor, and serenity of the one of a kind North Cascades wilderness. I grew up exploring this beautiful area on hikes with my family and they are some of my most treasured memories. I know that being in nature has inherent risks, but I will not feel comfortable at all bringing my kids to the North Cascades anymore if this happens. It is heartbreaking to think about my kids not sharing these same memories I have. In addition, even though this area is wild, it is nearby so many large populations of people that are ever expanding. It would be unfair for the bears to be placed in this area because it would set up conflict and confrontation with humans that are entirely unavoidable. Additionally, several heavily used highways access the very heart of the NCE including, SR 20, US 2 and I90. The hundreds of overflow-vehicles lining SR 20 on weekends around trailheads is a testament to the intense recreational interest and use of these wild lands, which is steadily increasing. I have experienced lines of hikers and their dogs using the popular trails along the crest of the Cascades. Estimates of use in this area are definitely underestimated, because not everyone signs the trail logs.

The EIS seems to rely heavily on Yellowstone Park statistics regarding bear/person interactions citing the park's large visitor use. However, the data doesn't reveal that the great majority of those visitors are primarily driving along the roads and hiking heavily used boardwalks to popular hot springs. In the North Cascades, there are many more people accessing backcountry trails in the deep wilderness where encounters will be much more likely. You can't compare experience at Yellowstone Park to the NCE, Yellowstone has been in the business of people & bear Management for over a hundred years. Also, unlike Yellowstone, the NCE has no big herds of ungulates to prey upon.

There is no logical reason why bringing grizzly bears to this area is a necessary or positive thing for anyone (or animal) directly involved in the situation. The main reason that I have heard in support of it is simply because it used to be an area where they lived. But, the area has changed so dramatically and it is not a positive thing for the bears to have to be confronted by angry or scared people who could act in drastic ways and harm or kill the bears. And, it is not a positive thing for the farmers, ranchers, and recreationalists who would be facing the threat of encountering grizzly bears when going about their daily lives. I very strongly support the 'no action' alternative and I hope this is just one story of many that helps encourage this decision. Thank you for your time and consideration.

Correspondence: I am writing to express my reservations regarding the proposed reintroduction of grizzly bears to the state of Washington, particularly concerning the potential impact on local elk and deer populations. While I appreciate the importance of wildlife conservation, I am concerned that the presence of grizzly bears may have detrimental effects on these key prey species.

Elk and deer are crucial components of Washington's ecosystems, and their populations are already subject to various challenges, including habitat loss and other environmental pressures. The introduction of grizzly bears, as apex predators, has the potential to further disrupt the delicate balance within these ecosystems.

One of the primary concerns is the predation pressure that grizzly bears could exert on elk and deer populations. Grizzly bears are known to be opportunistic hunters, and their reintroduction may lead to a decline in these ungulate species. This could have cascading effects on the entire ecosystem, affecting not only the populations of elk and deer but also the predators and scavengers that depend on them.

The potential decrease in elk and deer populations could have significant repercussions for hunters, who play a vital role in wildlife management and contribute substantially to conservation efforts through licensing fees. A decline in these popular game species could adversely impact local economies and recreational activities, leading to unintended consequences for

both residents and the state as a whole.

Before moving forward with the reintroduction of grizzly bears, a comprehensive and scientifically rigorous assessment of the potential impact on elk and deer populations is essential. This should include thorough modeling of predator-prey dynamics and consideration of alternative conservation strategies that minimize disruption to existing ecosystems.

I urge you to carefully weigh the potential consequences on local wildlife populations, taking into account the concerns of hunters, conservationists, and other stakeholders. It is crucial to strike a balance that ensures the conservation of endangered species without unduly compromising the well-being and sustainability of existing ecosystems.

Correspondence: The DEIS, as written, seems adequate for the NEPA process associated with the reintroduction of grizzly bears to the North Cascades Ecosystem (NCE). The alternatives and their comparative evaluation seem reasonable and suitable to restoration the grizzly bear population in the contiguous 48 states under the Endangered Species Act.

General Comments

Restoring grizzly bears to the NCE is a critical step to making the ecosystem whole again. It completes the wilderness. It restores the integrity of the ecosystem, notably rebuilding interspecies relationships and behaviors. As the reintroduction of wolves to the Yellowstone ecosystem illustrated, the chain of behavioral changes (elk/beaver/riparian birds) may be more impactful than the simple competition for resources.

Alternatives B and C are both proactive recovery plans to establish a small population. The presence of grizzlies on the landscape will: reverse the trend towards extinction and improve biodiversity and transform the backcountry experience. Grizzlies are not without downsides: risk to human safety, risk of livestock and agricultural losses, cost and opportunity cost, changes in human behavior, and deterrence to risk-averse visitors.

For me, the rewards greatly exceed the downsides.

"Substantive" Comment

One aspect of grizzly reintroduction to the NCE that is not developed in the DEIS is the interaction with recovery efforts in Canada. There are a dizzying set of possible outcomes that have some chance to seriously impact management of the US reintroduction that are only hinted at in the DEIS.

On pages 24 and 48-49, the DEIS notes that the British Columbia government and First Nations intend to recover grizzly bears in the Canadian portion of the NCE, likely by translocation. The presence of translocated bears across the border raises the possibility of several immigration scenarios that impact Alternatives A, B and C in complicated ways.

The permutations of outcomes are too many to review, but some examples illustrate the possible impact on US management plans. For the purposes of illustration, let's assume that translocated Canadian bears have radio-tracking collars and their DNA has been sampled. Hence, they can be tracked and individually identified. Their progeny may be unknown, untrackable and only identifiable through DNA sampling. And assume that US and Canadian wildlife management are in complete communication and harmony, say, through IGBC ecosystem executive committees.

The DEIS (p. 24) says that a Canadian bear immigrating into the US would be covered under the 4(d) rule but not 10(j), if triggered. If a collared bear crossed into the US, one would imagine that BC authorities would notify US authorities. Is that bear managed differently from a translocated US bear, who, ironically, might have been translocated from BC? If an uncollared bear immigrated to the US, it would represent "natural recovery" and fits how into Alternative C? Determining an individual bear's origin would require a DNA sample.

A single bear doesn't make a population, but a female with a range straddling the border could, in a couple of years. How do you treat the first immigrant?

An extreme example of the possibilities would be: if the US EIS process is suspended again and Alternative A is selected by default, translocated bears in Canada could immigrate and seed a "natural recovery" that would necessitate ingredients from Alternatives B and C: public education; improved sanitation; and research and monitoring to determine grizzly bear presence, distribution, habitat, and home ranges. Alternative A is no longer viable.

It isn't obvious to me how probable any scenarios like these are. The interaction with Canadian activities seems important and complicated, and might beneficially have been addressed in the DEIS.

However, it may be just too arcane to address them in a public document like an EIS. The IGBC is the cited mechanism of coordination with Canadian authorities. Hopefully, at this point in history, this is a well-oiled and effective mechanism. I trust that the public employees will know the right thing and do it if the time comes.

Correspondence: I am strongly opposed to bringing Grizzlies to the North Cascades. I am perturbed that the title of the plan is "restoration"; if the habitat for Grizzlies was present in this area, there would be Grizzlies there. Where the habitat exists there are Grizzlies. They are not endangered where there is proper habitat. Please do not force the people who live and recreate in the North cascades to have to deal with Grizzlies. Respectfully, find something better to worry about than putting bears in areas where there are people.

Correspondence: This is not a good idea. As someone who rides horses, four wheels, hikes, camps and fishes on park lands, this is going to result in some very bad situations.

You can say you're only going to release grizzlies in areas where humans don't live, but as you can see by the wolf and cougar, elk, deer, coyotes and more populations, that only lasts until the population gets so large that the ecosystem can no longer sustain them. Then they start to move where humans live, recreate or have livestock and we are back in competition with them again.

I hate to say it, but there are a lot of people who are in the parks and on the trails that have no sense, as seen by the people trying to pet the buffalo. These are the people who most likely are wanting the Grizzlies reintroduced because they lived there a couple hundred years ago. But they don't have to live with them in their back yard or put up with them when they are no longer scared of humans. They are the ones who will leave food out either through ignorance or because they don't think a bear will hurt them and either cause the animal to be killed or other people to get hurt.

I know that I don't want to come across one while out riding or doing any of things I like to do.

What is going to happen when they have a population explosion because hunting isn't allowed? What is going to happen when livestock gets hurt or eaten? When pets or people get hurt? Are we going to have the same situation like what is going on with the wolves?

We have to remember that Grizzlies are an apex predator, meaning that they have no natural enemies except other grizzlies and/or humans. I know that the, and I hate to use the term, "greenies"; won't want them to have any sort of population control until they get to be way to big of a problem.

Correspondence: I fully support the reintroduction of grizzlies to the Cascades. Please do not let close-minded, uneducated, lazy, and irresponsible individuals to deter this plan from happening. So many people have already submitted uninformed, ignorant comments that are fueled by propaganda and the unwillingness to acknowledge facts. Grizzlies returning to the North Cascades will hardly impact humans whatsoever, and the humans that it does stand to affect, can mitigate the issues they are concerned about through personal responsible measures. Grizzlies would still be in these areas if it were not for the same type of individuals who are being vocal about the bears not returning. Please help these wonderful creatures return to their former home.

Correspondence: I strongly support the Endanger Species Act section 10(J). I also support section C of the alternatives to choose from. I was involved in the initial Grizzly Bear Pan and I know that the habitat is sound. I was the Assistant Superintendent at the time.

This plan will both effectively restore grizzly bears in North Cascades National Park and give people the tools they need to thrive in and around grizzly bear country. Grizzlies belong in the North Cascades, as they enhance the park's ecological integrity and contribute to its wildness.

Grizzly bears play a vital role in maintaining ecosystem balance, cycling nutrients, dispersing seeds, and changing the behavior of species around them. Restoring them would benefit the park and the people who use it.

A restored population of grizzlies will boost the park's appeal and attract nature enthusiasts, scientists, and tourists from around the world. This would provide economic benefits to local communities and support the park's mission to protect park resources in perpetuity.

Alternative C, with the 10(j) rule, provides managers flexibility to address community concerns while protecting the grizzly population. It ensures coexistence between humans and bears.

There were two opinion polls earlier while at the Park. Both showed ver favorable support for Grizzly Bears in the ecosystem. As I recall, approximately 75 % of respondent were in fave of restoration with a vocal group of about 18% in favor with the rest undecided.

Please consider the positive ecological and economic benefits and support Alternative C. Restoring grizzly bears will secure the park's natural heritage and conserve an iconic species for current and future generations.

Thank you for your dedication to our national parks.

Correspondence: I've taken a personal interest in the science that goes into bringing large carnivores back to portions of their historical ranges. I'm also an avid trail runner and hunter who spends as much time as I can afford in the North Cascades. I'm a poster child for someone likely to encounter a grizzly at some point, and so I've given this a lot of thought and consideration over the years. Ultimately, I feel that grizzlies belong on this landscape. It was a sin against nature to have extirpated them in the first place.

I do hope officials will allow for recreational hunting to assist in managing numbers once the state hits predetermined population targets. There is a supply and demand side to this heritage we're privileged to still enjoy, and participation feeds into a system that funds conservation work. Mandate packing out the meat and forfeiting gall bladders to state officials to maximize use of the resource without waste or exploitation.

Thank you for the opportunity to comment on this issue.

Correspondence: I support proposed alternative B because I believe we should do what we can to restore the grizzly bear to its former range as much as possible, both for the cultural and ecological significance of having a thriving grizzly population in the NCE.

I support alternative B over alternative C because if we are going to go through the trouble of transporting bears from Canada, Montana, or Wyoming to Washington, we should do what we can to protect them, even if it comes at the expense of livestock and/or economic activities; otherwise, what's the point? Livestock should not be grazing in public lands, so I do not consider livestock predation to be a valid concern. As for other economic concerns, such as timber and mining, I prefer restoring and protecting grizzlies over protecting market concerns. There are trees and mines elsewhere throughout the country, so if a company does not want to deal with the burdens of the ESA, they can go somewhere else.

Overall, I think NPS (and FWS) did a good job addressing the concerns that I had about preserving wilderness character. I agree with NPS' reasoning concerning wilderness impact. Restoring grizzly bears adds to wilderness character more than what a few helicopter flights year detracts from it. Certainly, the helicopters couldn't be worse than the EA-18G Growlers that the Navy regularly fly over Olympic National Park (when will they be held in violation of the wilderness act?).

Thank you for the informative draft restoration plan/EIS and for considering my comment.

Correspondence: US Department of the Interior
US Fish and Wildlife Service
National Park Service

Dear Human Beings,

Regarding the Draft Grizzly Bear Restoration Plan/Environmental Impact Statement for the North Cascades Ecosystem, September 2023, I offer the following comments:

When I wore a younger man's clothes, I had the luxury of working one summer in Glacier National Park, specifically, Many Glacier. I actually considered it a paid vacation. During days off, most of the employees would typically go hiking, including myself. What memories are forever etched in my mind?

Those of encountering, experiencing, and quite simply, being in awe around GRIZ. The best memory, is encountering a sow with her two cubs, literally on the Continental Divide. Several encounters that summer as well as additional encounters on several week-long backpacks in subsequent years.

As Edward Abbey stated, "A wild place without dangers is an absurdity... we must not allow our national parks and national forests to be degraded to the status of mere public playgrounds. Open to all, yes of course. But enter at your own risk."

Restoring GRIZ is the right thing to do culturally, environmentally, ethically, as well as a legal obligation to restore this iconic, top apex predator native species. Due to the numerous threats to this species, population augmentation is the only way to recover GRIZ. The species has the second slowest reproductive rate of all North American mammals, making it all the more harder for it to rebound from threats to its survival. In addition, from a species standpoint, it's better to have more distribution in case of ecological disasters or disease breakouts.

GRIZ also is an important player in the ecosystem by providing an ecological role for what bears are famous for in the woods, which ends up distributing nutrients and seeds.

I support Alternative C but with needed changes to the proposed 10(j) rule. The proposal would bring up to 25 non-conflict grizzly bears - likely from Montana - into remote areas of the North Cascades over the next decade and manage them as an experimental population.

The proposed 10(j) rule as currently written fails to give grizzlies the best chance to succeed and is too permissible in allowing reintroduced bears to be killed.

Lethal removal of a grizzly bear should only be considered where there is a demonstrable threat to human safety, and, for non-immediate threats to human safety, only after non-lethal management options, including concerted use of conflict prevention methods, have been exhausted.

No grizzly bears should be hazed or relocated as a result of conflict with livestock unless demonstrable, repeated efforts have been made by the livestock producer to prevent such conflicts, using commonly-available techniques.

No grizzly bears should be killed on public lands as a result of livestock depredation.

Landowners/private citizens should not be given a permit, or otherwise authorized, to kill a grizzly bear.

No grizzly bear should be preemptively relocated if the bear is not a threat to human safety, particularly if the bear has not become habituated or food-conditioned, or when nonnatural foods/attractants have not been properly secured and made inaccessible to bears. Doing so acts as a disincentive for communities to employ conflict prevention measures, and increases the risk to the bear of injury or death from capture and relocation.

In summation, bears don't pollute, clear cut, burn or cause extinction of animal species. In fact, I believe our Wilderness areas need protection from OUR species, the most irresponsible, dangerous and destructive animal in the wilderness ain't GRIZ, it's us, and our burgeoning population.

Many thanks for the opportunity to help support these critters.

A Wilder,

Correspondence: This is a foolish concept with a history of well founded rebuttals. Here we are spending a huge amount of dollars ripping up perfectly serviceable culverts in Washington state to return the salmon population and simultaneously proposing introducing a species that is debatably even historically a tangible thing. Grizzlies will invariably return to the salmon grounds in valleys rather than remaining in high altitude low food ridge areas. Guess what? Human conflict. Who loses? Bears. Always.

I am a land owner in the potentially affected valley areas. The bear will lose. The bear will lose.

Relinquish these poorly procured research and public probing funds towards access road maintenance for recreational use. I have spent several thousand hours in the last 20 years maintaining FS Rd 2060 with nearly zero help from the feds.

Grow up people, and be realistic and absorptive of the needs and desires of your constituents.

Grizzlies are not compatible with the current NPS AND FS LANDS.

Correspondence: No Action Alternative A

Grizzlies are no longer endangered and have been requested to be removed from the Endangered Species List. It is unnecessary for the redundant actions of inserting grizzlies in a more populated area of the NCE.

Grizzlies do not stay in their recovery zone. They can wander up to 1500 miles. Grizzlies are apex predators. When they awaken from hibernation, they will do what they can to get what they need for fuel. That is their instinct.

I would like to leave a few words of wisdom from the Proverbs 27:12

"The prudent see danger and take refuge, but the simple keep going and pay the penalty."

The people in and near the recovery zone are prudent. We see the danger, We are raising the flag.
Please don't make us pay the penalty.

Correspondence: To whom it may concern,

I am writing to support the restoration of grizzly bears to the North Cascades Ecosystem, their historic range for thousands of years. Where grizzly bears thrive, so does clean water, and abundant native fish and wildlife populations.

I support Alternative C but with needed changes to the proposed 10(j) rule. The proposal would bring up to 25 non-conflict grizzly bears - likely from Montana - into remote areas of the North Cascades over the next decade and manage them as an experimental population.

The proposed 10(j) rule as currently written fails to give grizzlies the best chance to succeed and is too permissible in allowing reintroduced bears to be killed.

Lethal removal of a grizzly bear should only be considered where there is a demonstrable threat to human safety, and, for non-immediate threats to human safety, only after non-lethal management options, including concerted use of conflict prevention methods, have been exhausted.

No grizzly bears should be hazed or relocated as a result of conflict with livestock unless demonstrable, repeated efforts have

been made by the livestock producer to prevent such conflicts, using commonly-available techniques.

No grizzly bears should be killed on public lands as a result of livestock depredation.

Landowners/private citizens should not be given a permit, or otherwise authorized, to kill a grizzly bear.

No grizzly bear should be preemptively relocated if the bear is not a threat to human safety, particularly if the bear has not become habituated or food-conditioned, or when nonnatural foods/attractants have not been properly secured and made inaccessible to bears. Doing so acts as a disincentive for communities to employ conflict prevention measures, and increases the risk to the bear of injury or death from capture and relocation.

These changes are crucial in providing adequate protection for grizzly bears.

Public opinion polls have shown broad support for grizzly bear restoration in Washington, including among those who live in the North Cascades. Please bring back this native species to our state through the strategy laid out in Alternative C and with appropriate changes to Section 10(j). Doing so will restore an important piece of our ecosystem, regional culture, and natural heritage.

Correspondence: I oppose grizzly reintroduction in the North Cascades. We have had two different grizzly bears on trail cams in Manning park relatively recently. Grizzlies have been observed in Ferry County, and recently one washed up on a Washington beach. They are either near the North Cascades or a small population exists there. If the North Cascades is such great habitat, let them reestablish naturally or spend the money researching and helping the small population that probably exists there. I would much rather have the chance of observing a rare grizzly bear from a natural population, than a bear that has been brought in by man from another population.

Correspondence: Thank you for taking comments on grizzly bear recovery in the North Cascades.

Grizzly bears are culturally and spiritually important to Indigenous people in the region, and ecologically important for the dispersal of plants and seeds, and for soil aeration.

The North Cascades is a recognized bear recovery zone and an ideal habitat for a self-sustaining bear population.

Humans have caused the steep decline of grizzly bears. We have a responsibility to restore them and an opportunity for our generation to leave the land in better, more resilient shape than we found it. An ecosystem that can support bears is a healthy ecosystem.

North Cascades National Park is my "go-to" National Park. I typically visit the North Cascades 2-3 times a year. In addition, I visit Alaska/BC almost yearly to view and photograph coastal brown bears.

I support grizzly bear recovery in the North Cascades ecosystem.

Correspondence: We have owned a home in town for about 12 years now. I have no objection at all to the plan to introduce grizzlies to the north cascades, as presented in this plan. As many as needed, in time frame needed, all figured out by the scientists, land managers, and wildlife biologists in charge of the plan.!!

Some leading citizens , long time residents in town, have decided that they know best and many follow their lead, as to what's what with what should and should not go on in the woods. The town is still very angry about what happened with the spotted owl debacle, and now other endangered species getting all this "special treatment", supposedly at the expense of hard working people like in Darrington. Rightful anger, understood. People lost their livelihoods over that owl. So I hear. So any semi controversial idea with a huge manufactured fear factor can get people riled up, and the "no stupid government official is going to tell me what's best for my woods" position is a main factor here.

For me, th north cascades is a huge place, and 3 or 7 bears in places I will never get to is not going to keep me from hiking. Whether tourists will avoid the area for fear of the bears or come hoping to see them is an open question.

Top predator species are important and necessary.

My .02.

Correspondence: The only acceptable decision is option a - no action. at the Okanogan County Historical Society Museum the records show a "cow killing" grizzly bear was shot in 1923. This bear weighing 1350 lbs was said to be the only "true grizzly" killed in the state of Washington. The bears skull and hide were mounted and sent to the Smithsonian Institute. The grizzly has been killing hundreds of cattle and 35 sheep. A state paid predatory hunter was paid to track and kill this grizzly. The very next year the same under was hired to aid in a hunt for a cougar that killed a young boy in the Chiliwist in late 1924. I have visited the monument to this boy south of Okanogan. Very clear excerpts from Lewis and Clark journals comment at Thompsons River B.C. 1851 - 11 hides brought in. At Ft. Nisqually 4 - hides near Tacoma. At Fort Colville - a higher number hides Fort Nez Pierce near Walla Walla 1846 - 32 hides by Paul Schullery. I am sending to you the Vol 54 #1 Winter 2015 Publication. Many people who see large bears in our area claim they are grizzly but without hair sample or scat or the skull proving the particular ridge of bone on the skull - they lie! I am a 4th generation McHugh family member 74 years old. We don't have grizzlies because the habitat for them is not here/ The efforts of WDFW to force Apex predator bears on us is, on top of the hybrid wolf/dogs, discontinuing spring bear hunts and cancelling permits for hunting cougars with dogs has completely descimated our local deer population. I live 4 miles from Twisp and have seen wolves in my yard 5 times in the past 10 years. Growing up - we had no wolves. I have been a camp cook for 2 wilderness outfitters for 25 years in both the Pasayten and Sawtooth Wilderness areas. I spent countless helping clean our trails. Stop the Lies! Alternative A is the only acceptal plan - please.

Correspondence: Dear Superintendent,

I would like to go on record as only supporting Alternative A (the no action alternative) regarding Grizzly Bear recovery in the NCE. I agree with the FWS conclusion that grizzly bears are extirpated (functionally extinct) in the NCE. In fact, there is no evidence grizzlies are anything but extinct in the Cascades.

For me, a fifty-year user of this wonderful resource, there is no benefit and very significant downside to any effort to attempt to put grizzly bears back into an area where they no longer exist. This is not recovering a population, this is reintroducing a population. It is a terrible idea. I disagree there is ample habitat, and whatever habitat is available is utilized entirely by black bears, whose replacement by grizzly bears would be a brutal combination of violence and starvation.

Speaking of violence; men, women and children will die as a direct result of any reintroduction of grizzly bears into the NCE. Whoever supports the reintroduction of grizzly bears to the NCE will have blood on their hands. Just a couple of days ago, a married couple and their dog were killed by a grizzly bear in the Banff National Park. Dead, torn apart, spread across the ground. I can only imagine the terror of their final moments. There are at least seven million people living within easy driving distance to day hike, backpack and climb mountains in the NCE. Judging from the cars packing trailheads and extending a mile down roads from Ruth Creek to Austin Pass to Schreiber's Meadow to Hidden Lake to Cascade Pass to Rainy Pass to Blue Lake to the Suiattle River to the North Fork Sauk River and on and on, the NCE is filled with people. This is an unprecedented amount of people living near a recovery zone, as all other recovery zones are in areas with far smaller and in most cases miniscule human populations nearby. No amount of "management" will reduce or eliminate the "conflicts" between grizzly bears and people. And let's be real, it's a "conflict" if it happens to a stranger, but it's a tragedy if it happens to a loved one.

It is time to move on, leave grizzly bear recovery to natural recovery over time if it is to be, and get the NPS and USFS focused on maintaining the crumbling, potholed and brushy roads, trailheads, and trail networks that are or were a wonderful local, national and international resource.

Correspondence: Dear Superintendent:

I am opposed to the release and management of Grizzly Bear into the State of Washington and specifically the North Cascades National Park Complex. Presently, with the active brown bear population, the predator/predation ecosystem is at a suitable balance for the predation species. Introducing the grizzly would upset that system and cause it irreparable harm. In my opinion, the Black Bear is the only bear that can fit into present and future wildlife populations.

Additionally, for more reasons that I can detail in this letter, the Grizzly Bear is not compatible with established long term and area Wide travel patterns of Washington State. A good example is the thousands of Pacific Crest Trail hikers who end their trek in the North Cascades south of the Canadian Border, having gotten there by passing over 2,000 miles of non--grizzly populations. Additionally, introducing Grizzly to Washington State will discourage families with young children, older visitors, and handicap. PLEASE, do not introduce or manage Grizzly in Washington State.

Correspondence: Grizzly Restoration Project,

Please reconsider introducing grizzlies to the North Cascades. The area has unrestricted access to towns and major recreation areas in addition to extensive backcountry use, including the Pacific Crest Trail. Since 1980 there have been no human deaths by black bears in Washington, and 11 by grizzlies in Yellowstone and Glacier National Parks, with more than twice the number of black bears in Yellowstone and Glacier than brown bears.

You may be able to track the bears, but you can't track all of the people. Someone will be attacked or killed and it will be because of your decision if you allow grizzlies to be introduced into the North Cascades.

Correspondence: Re: Restore grizzly bears to the North Cascades?

Greetings,

Pursuant to an article in the September 29, 2023 Seattle Times, federal officials are floating plans to reintroduce

grizzly bears into the North Cascades of Washington State.

Enclosed is an article from October 2, 2023 Seattle Times page A2 NEWSLINE, stating, "A grizzly bear is believed to have fatally attacked two people at a national park in southwest Canada..."

In addition to being a deadly threat to deer, elk, black bear, livestock and humans; grizzlies are also known to feast on spawning salmon.

With all the efforts to "Save the salmon in order to save the Orcas", it makes no sense to introduce yet another salmon predator into the Upper Skagit and North Cascades wilderness areas.

The federal agencies also offered the option of taking no action, and instead relying on the bear's natural recovery.

I support this "no action" alternative.

Thank you,

Correspondence: Dear Sir or Madam,

Subject: Reintroduction of Grizzlies to the North Cascades

Thank you for providing the public to comment on your Environmental Impact Statement regarding the reintroduction of Grizzlies to the North Cascade region.

On one hand I support, with some trepidation, the introduction of Grizzlies. Then on the other hand I question whether Grizzlies and Humans can live harmoniously. Just recently two hikers were killed by a Grizzly in Southwestern Canada. My wife and I are avid hikers and enjoy hiking around Mt. Baker region. Knowing that one male grizzly can have a range from 150 to 500 square miles, there will be undoubtedly some encounters.

Other issues to consider are the ranchers and dairy farmers. If they incur losses, how will they be compensated? How will they impact the fledgeling salmon runs? VWI they drive out their smaller cousin, the black bear? Are there enough hooved animals in the back country to support 1,200 pound male grizzlies? All questions, and surely more, need to have sound answers, preferably by the numbers, and not by mere estimations.

Yes, I support grizzlies in the North Cascades, but only if there is sound evidence that both the grizzly, the environment, and humans can coexist. Perhaps with It century technologies the grizzly population in Washington State can be managed in a manner that makes it safe for the grizzlies, the human communities, and the environment.

I hope the above comments are found helpful.

Correspondence: Re: Draft Grizzly Bear Restoration Plan / Environmental impact Statement, North Cascades Ecosystem

Re: FWS--RI--ES-2023~OO74).

As someone who has hiked and backpacked in North Cascades National Park's backcountry since before the Park was established, I urge you to base your management decisions on avoiding the harmful consequences of human-bear encounters and not on symbolism, nostalgia, or emotional appeals to the grandeur and romanticism of bears in the wild. Bears and humans can and have co--existed without incident. I recently returned from several days at Hallo Bay in Katmai National Park and the encounters with coastal brown bears there were extraordinary and provided many wonderful memories. But the bears there are also extraordinary. They have plenty of food and do not perceive humans as either a threat or an opportunity. Bears in the interior of Alaska or in the Canadian or North American Rockies behave much differently.

There have been far too many violent encounters, including the September 30, 2023 incident in Banff National Park which left two hikers and one bear dead. Although bears generally do try to avoid humans, bears (like humans) make mistakes. Over the years, there have been more than enough maulings to warrant rigorous management measures to minimize the chances of adverse human--bear encounters.

Preserving the wilderness experience for backcountry visitors while also assuring public access is a tough job. I do not envy you nor do i intend to second guess you. It does seem to me, however, that more bears, and particularly more grizzlies, mean more restrictions on backcountry use, more dead or injured hikers, more dead bears, or all of the above. All of those consequences seem bad to me.

There is another proposal for returning Grizzly Bears to the North Cascades. I can only say why not? High Country News Magazine also endorses returning predatory species to a natural habitat. One only needs to a discussion of wolves in the Umatilla National Forest in North East Oregon. as of late - - - fires are burning dry forests and apparent slash in Canada and the United States. One reads of Martins being released in Washington at carbon capturing, forests an large ecosystems are to be preserved all of this must be done.

In eastern Washington well over so presed of undisturbed habitat is now some. Well have deer and elk along the Columbia River. Maybe even Mountain Lions. Yes, return all assorted bears and wolves to previous terrains.

Correspondence: To Whom it may concern,

The North Cascades National Park has been doing a fine job of managing such a very spectacular wilderness of mountains and valleys. We have both grown up in the Lake Chelan Valley and so appreciate all that it offers. We especially have backpacked on almost all of the trails encompassing the Park and Pasayten Wilderness, and so enjoying the feeling of unspoiled wilderness, ice capped mountains and all that wilderness offers. Now our children and grandchildren share the same appreciation of our beloved area.

Your proposal based on the economic benefits are not the same as in Glacier, Yellowstone, etc. There are no roads where tourists can sit in their cars and see the bears. You have to walk miles in the North Cascades and may never even see a black bear.

We request that you drop the attempt to reintroduce the Grizzlies into the area. Please just accept the previous results when tried earlier. It is our opinion that the Grizzlies if they want, will return to Washington State on their own accord.

North Cascades National Park Service Complex
810 State Route 20
Sedro Woolley, WA 98284

I'm writing in support of the proposed plan to restore grizzly bears to Washington State's North Cascades Ecosystem. Grizzly bears, historically, were a native population. It's only due to human interference that their population dwindled to negligible numbers. It stands to reason that humans, then, become the catalyst to righting these wrongs and restoring that with which we tampered. The idea that grizzly bears could one day be delisted under the Endangered Species Act within the contiguous United States is a laudable goal and takes precedence over people's fear-based reactions to the proposition. As stewards for our environment, it's imperative we

recognize and support the need for the biodiversity that grizzly bear reintroduction will bring.

As a property owner in the North Cascade region, I celebrate the diverse plant and animal populations with which I'm fortunate to co-exist. Part of what makes Washington such a treasured state is the enormity of biodiversity that surrounds us. Enjoying this land comes with inherent ethical and moral responsibilities. Historically, we've neglected these responsibilities in favor of economic opportunity. This mindset must change. We are part of this world, not above it. It's shameful to note that, by "1970, grizzly bears remained in only 2% of their former range within the contiguous United States" (Rine, et al) due to predator control, fur trade, and habitat loss. Surely, we've learned and grown in our perspectives; we have the knowledge and will to make amends for prior mistakes.

"The management of protected lands is primarily focused on the conservation of extant organisms" (Rine, et al). It's clear that the North Cascade region supports a grizzly population. While I understand people's fear, we can't let our actions be driven by emotional responses. We must act with the courage to do what we know is the correct course of action.

Establishing the North Cascades as a recovery zone is the right thing to do. I applaud the Washington National Park Service and US. Fish & Wildlife Service's careful evaluation of the environmental and historical elements of this proposal and look forward to the day when I can proudly say that my home state has taken the steps to right past wrongs and return grizzly bears to their native land.

Correspondence: Dear Superintendent,

I appreciate the opportunity to offer an opinion on restoration of grizzlies in the North Cascades. This topic is of interest to me, as a hiker and naturalist who grew up in Montana and now lives in Whatcom County. My family has a long history of loving nature, with my parents and grandparents having managed Sperry and Granite Chalets in Glacier Park.

My opinion is that grizzlies should not be re-introduced to the North Cascades. I am an environmentalist, and certainly understand why this would be considered, but in my opinion the drawbacks outweigh the risks.

Per my understanding, the grizzly population is doing relatively well in Montana, Alaska, and British Columbia. These regions have vast areas for the bears to inhabit, and relatively few hikers. (see graphic on page 2) By comparison, the North Cascades is a much smaller area that has many more hikers. Re-introducing bears to the North Cascades will result in more bear-human conflict. "Bear-human conflict" is a euphemism; these conflicts are terrifying experiences which often result in the death of a nature lover in the prime of their life, and also usually the death of a bear. As a pathologist, I once reviewed an autopsy of someone who was killed by a bear, and the injuries were shocking.

Almost every year someone is killed in Montana by a grizzly. Many people who hike in Montana carry guns, in addition to pepper spray, to defend themselves against the bears. / no longer take my family on overnight backpacking trips in Glacier or the Bob Marshall Wilderness because of the growing grizzly population. I no longer feel comfortable having my daughters camping in the Bob (Bob Marhsall Wilderness).

I do feel comfortable hiking in the North Cascades because black bears are less aggressive than grizzlies. If bears are re-introduced into the North Cascades, more people will be carrying guns.

If there still were a significant grizzly population in the North Cascades, then my position would be different, because we would be protecting an existing population. But they are essentially absent from the area, and have been for decades. Thus, no bears will be harmed by not reintroducing them to the area. The bears have plenty of safer habitat in Montana, Alaska, and British Columbia.

In an area with such a high density of hikers, it is my opinion that the grizzlies should not be reintroduced. If they are, then every interaction in which someone is killed will become a political firestorm, on top of the tragedy that someone was killed. The political backlash could work against protection of current existing habitat.

It is to Nature's advantage to have people loving and enjoying the wilderness, because then they will vote to protect the forests. If you want people to love the bears, then don't move them into a small area where there are many people and conflict will be unavoidable.

Subject: North Cascades Grizzly Bear Restoration Plan/E18 (i.e., Transplanting and establishing a population of Grizzly bears in the middle of Washington State)

Washington State has a law that stipulates, " Grizzly bears shall not be transplanted or introduced into the state. Only grizzly bears that are native to Washington state may be utilized by the department for management programs" I don't believe that the us. Constitution enumerated powers to transport or install grizzly bears into Washington state, therefore, state law prevails. This is a "states rights issue".

Because Washington D.C., is not a state, The Federal Government does have the right to add Grizzly bears to any "District of Columbia" park that you see fit. Please let us know how that goes, and we can discuss it further.

I am strongly against any plan to relocate grizzly bears into Washington State. This is not the first time that this plan has been brought before the public for comment. How many times must you bring this forward?

Correspondence: SUBJECT: Proposed reintroduction of grizzly bears into North Cascades National Park

Dear Superintendent Striker,

I am writing to voice my opposition to this proposal to reintroduce grizzly bears into the state of Washington. I spent most of my career on the Kenai Peninsula in Alaska before moving to Washington State upon retirement. I know of many friends and acquaintances that carried a high caliber revolver with them when they went hiking in Alaska in the event that they came upon a brown bear threatening them. I have to say that it is nice to be able to go for a hike here in Washington State without fear of coming across a grizzly bear.

It seemed that there was at least one incident every year in Alaska where someone got mauled by a brown bear, usually with fatal results. The population of Washington State is about ten times the population of Alaska, so if grizzly bears were introduced into the state of Washington one might reasonably expect bear encounters to become more frequent than in Alaska.

In the event that someone got fatally mauled by a grizzly bear here in the state of Washington and you

were the person that made the deliberate decision to reintroduce grizzly bears, then this would morally make you an accessory to murder or manslaughter. I am not a lawyer and am not versed in personal injury law. I suspect that this is more of a moral issue than a legal issue as I would expect that the federal government would hold a person in your position harmless against all costs associated with a personal injuw lawsuit.

I see no upside to reintroducing grizzly bears into the state of Washington and I can only hope that you do not make this mistake.

Correspondence: Dear Sir,

I have lived, hiked, and hunted in Washington for 40 years. Putting grizzlies back into Washington is a terrible idea.

I have also hunted and hiked in grizzly country in Montana. You are in constant fear- -waking or sleeping- -that you will be attacked no matter how cautious you are and even with all the recommended precautions. This is not a great way to enjoy the out of doors.

When most people go into the wilderness, it is to commune with nature and with God. Being in constant fear for your life hinders this considerably.

If they were put back most people who are in favor of this would never see them. I guess for them it is just "knowing that they are there" is what they want. That to me does not justify their introduction to our state. The deer and elk population in the North Cascades is already pretty meager. What few animals that are there would likely be devastated by grizzlies (and wolves) as they have been in Idaho and Montana.

If a person wants to see grizzlies, he or she could try to see them in Yellowstone. It is not likely you will see them there unless you are back country hiking. Also, if grizzlies were introduced to the North Cascades, the likelihood of viewing them would be extremely low for most people.

i have greatly enjoyed my time in the North Cascades and would be extremely disappointed if grizzlies were introduced there. Please do not take this foolish action which would be detrimental to the beautiful and peaceful ambience of the North Cascades.

Thank you for reading my letter and taking it into consideration.

Correspondence: RE: North Cascade National Park Grizzly Plan

Dear Sirs:

I am completely against restoring Grizzly bears to the North Cascade Park. I have hiked all over the Cascade mountains. I have seen just about every other animal. None worries me. None have ever bothered me. I wear a bear bell.

But Grizzly bears are unpredictable. One minute calm at a far distance, next charging. They are apex predators. Bear spray will not stop them. The only solution, carry a gun? You only have to read the news every summer about Grizzly bear attacks. This is the reason people of past generations shot all the Grizzly bears.

If introduced, the parties involved in the restoration will have a liability to anyone injured or killed by a Grizzly.

Please leave the North Cascade National Park in its current state: No Grizzly bears.

Correspondence: About 4 or 5 years ago, the USDOJ determined that Grizzly Bears (*Ursus arctos horribilis*) were neither threatened nor endangered in the USA. Has their population actually declined that much between then and now? Is it CRITICALLY necessary to restore them in the NCE? How many times must the decision-makers, as specified in the NEPA regulations, make decisions about GB's status and reintroduction plans?

The EIS Alternative B&C do not provide any convincing grounds to move forward with this reintroduction; it only mentions questionable spiritual or otherwise intangible benefits, such as "Seek to support Tribal, cultural, and spiritual values related to the grizzly bear," that are subjective and cannot be definitively demonstrated.

I join the individuals who are submitting their comments who are also not persuaded by the arguments that grizzly bears NEED to be reintroduced to the NCE simply because this area is suitable habitat and that they used to live in it. Mention is made in the EIS regarding "ecological resilience" and for the benefit and enjoyment of present and future generations of people. So EVERYBODY will be educated and therefore enjoy GB? Will this "ecological resilience" be gauged strictly by GB populations alone? Is there some demonstrable deficiency in the NCE or is there harm that is occurring to this ecosystem that can be traced to their absence? Is there valid proof that this ecosystem benefitted or was in better condition as a direct result of their presence prior to their population decline? Has there been any tangible harm or significant departure from historical variability in the NCE that can be unquestionably trace ONLY to the bear's population decline (- - - - than the bear's population decline itself?) Have other species declined concurrently with the GBs?

These newly released bears will uncontrollably stray from or not remain in place on federal lands (or any other public lands in the NCE) which will inevitably result in confrontation with people. The results of these confrontations will almost always be detrimental to these bears (when taking place in the USA). This is eerily similar to the reintroduction of wolves in Idaho in 1993 which has since resulted in more than one "take" primarily due to their interference with livestock activities (cattle, sheep, etc.). If Alternative B or C is implemented, are we morally and ethically OK with the inevitable "takes" of these artificially introduced grizzly bears (which are presumably reluctant participants) that were non- - - - - NCE from the time of their decline until this plan? Apparently so, according to Alternative B, "This - - - allows grizzly bears to be taken under specific circumstances as long as such take is reported promptly to the FWS. These circumstances include defense of life; federal, state, or Tribal scientific or research activities; or removal of grizzly bears involved in conflicts by authorized federal, state, or Tribal authorities." No GB have been killed in Washington because there have been - - - - - "trigger" a self-defense reaction. However, some of these reintroduced bears or their offspring - - - - - killed because of self defense or protection in and around the NCE as a DIRECT result of this proposed reintroduction of this aggressive species. Why introduce a species that has no value to hunters knowing that an unknown number - - - - - killed in self defense or protection? As stated in the "Background" section: "As human population density increases the frequency of encounters between humans and grizzly bears also increases, resulting in more human-caused grizzly bear mortalities because of a perceived or real threat to human life or property." Are we also OK - - - - - accepting - - - casualties or injuries from unexpected surprise encounters? Casualties that would NOT occur - - - - -.

Have cumulative - - - - been considered? Some parts within and many areas around the NCE are populated (with people) and well - - - - percentage of these GB are likely to stray from the NCE to these lands. Most, if not all, animal species - - - are

native to Washington flee when they detect people (outside of their mating seasons): grizzly bears don't. - - - - - this - - - - -
- - - - - grizzly bears and people in danger of one another? Is this "collateral damage" worth it? It's as if some of these bears
are going to be sent to their deaths as a result of Alternative B or C.

Grizzly bears are present in Alaska, Montana, and western Canada where they have always been, even though government
agencies consider them to be threatened or endangered. People in these area see or encounter them with regularity. - - - - -
- - - - they have always been (there) is why people indigenous to these areas have learned to (more or less) live with them.
Reintroducing a notoriously ornery apex predator to an area (NCE) whose culture has changed considerably - - - they were
last seen or detected centuries ago will be an unnecessarily brutal upheaval.

While injuries to and, God forbid, deaths of people who inadvertently startle or suddenly encounter a GB in the NCE, where
there use to be none, will take place, an equal or greater toll on these newly introduced GB will also take place. In other
words, releasing GB into the NCE is an UNNECESSARY plan for their deaths, for human tragedies, and for renewed
conflicts in an ecosystem (that includes people) which never lamented the absence of GB.

While I absolutely do NOT pretend to express or share the collective opinions of Tribal Members in and near the NCE, I
have worked with a number of "them" for the better part of the past 20 to 40 years. Most of the individuals whom I have met
during this span are avid outdoorsmen who take advantage of their "Treaty Rights." Approximately zero of these individuals
have expressed a desire to see GB "reintroduced" into Washington State. Some have claimed to witness the species here in
Washington, and these claims are eventually followed with "what I would do" if they had an encounter with one. What these
individuals "would do" would not benefit the GB.

Has any thought been given to other possible reasons why GB are no longer extant in this area? Other than they "have been
functionally extirpated?" Perhaps they do not inhabit the NCE for other reasons? (EIS p.6: "Therefore, it is unlikely that
grizzly bears from areas within British Columbia would naturally emigrate to the NCE.") When they are released at the
strategic locations, will those people who are present be armed just in case? Will these bears eventually migrate north across
the border to the better habitat? Perhaps extensive use by people in the NCE who partake in hiking, food gathering, hunting,
driving, skiing, fishing, ORV use, snowshoeing, snowmobiling, equestrian, swimming, camping, mountain climbing, boating,
rafting, etc. might just drive them away again over the years? Not to mention higher road densities and human habitation?
This Alaskan and BC GB "habitats" which effectively extends into Montana, are incomparably more vas and do not
experience the relatively heavy concentration of use that the smaller NCE does.

Notice - - - - there are currently no berries between the NCE and the BC GB habitat. So what factors are preventing BC GB
from migrating of their own cognition to the NCE? Will the GB reintroduced into the NCE just ignore these factors and carry
on with their proliferation because Alternatives B and C said that they are supposed to? Or are the proponents of Alternatives
A and B counting on recreation (and human habitation) in the NCE to nosedive after news of the GB reintroduction becomes
widespread?

I am bias because making my living working outside in eastern Washington forests year-round. My "bias" is well supported
by the points made above. I understand that the purpose of an RIS is to analyze a proposal and report its impact in the
environment the protect area and its surroundings (cumulative effects). It is suppose to be objective and science-based. To
me, the facts presented in the 100+ pages of this EIS support Alternative A. The majority of the US population does NOT get
out into American forests on a day to day basis. In eastern Washington, the presence of cougars, bobcats, rattlesnakes, moose
in the north, hornets from August until the snow flies, and even black bears during the spring and fall (and to a lesser extent,
the rate badgers and wolverines) already make these forests an unsettling environment. However, these species have always
been there and we therefore know what we are dealing with. When I stumbled upon a black bear, or when they detect me and
feel threatened, they may hiss, stand on their hind legs, and sometimes charge. BUT their charges are just a brief warning
which eventually ceases (this typically occurs during their "rutting" seasons) if they notice me altering my course away from
them. I have hear enough true stories and seen - - - - - to conclude that GB do NOT cease or back off. When wildlife
biologists who are in favor of this reintroduction desperately try to persuade the American public that the many unpleasant
accounts of aggressive GB encounters are not to be believed - - - - of us who make out living "in the land" know better (many
from personal experiences - - - - to be misled by these advocates of Alternatives B and C.

PLEASE, I beg you, select Alternative A (no action) for the sakes of both the people AND the GB!!

Here is my token sarcastic comment about Alternatives B and C: Malaria used to be native to the USA, so why not reintroduce it so that people can experience this unique disease domestically?

P.S. I know that the - - - for comment submission states that I am supposed to divulge all my PII. If I was to do so, and this comment was circulated, I would lose my job. I cannot afford to allow that to happen.

Correspondence: Dear Sir:

I strongly oppose active grizzly reintroduction in the North Cascades. If grizzlies are to reenter the North Cascades by nature migration and natural expansion of their territory, that is rational. Grizzlies have endangered species protection from hunting so they can naturally expand their range if the ecosystem conditions permit. I believe grizzlies are protected from hunting in southern adjacent British Columbia which arguably facilitates natural expansion of grizzly range.

Too many people who advocate ACTIVE reintroduction of grizzlies live in their comfortable urban and suburban homes far from the on the ground consequences of reintroduction. They do not live in the north-central Washington counties whose citizens will be endangered by the grizzlies. And only a fraction of those advocates will ever visit the grizzly areas via camping and backpacking and thus put themselves in the temporary danger that local residents and local backpackers and hikers would have as a constant danger.

We know all too well the danger of grizzlies to humans--- -look at the recent deaths and injuries in Idaho/Montana/Wyoming! Natural expansion of range of grizzlies is acceptable. Active reintroduction clearly endangers humans. I mean, California has a grizzly bear on its state flag. Would California activists accept a few grizzlies reintroduced there?

Correspondence: ---Please respond to the citizen threat!

Grizzly bears are NOT vital to the Washington N. Cascades.

The U S National Park Service and the U S Fish and Wildlife Service are individually collecting public comment on their proposed 3--option Plan, two parts of which would reintroduce Grizzly bears forceful" W into the Washington State North Cascades (NC).

This proposed reintroduction interference in the natural progression of the N. C. bear population is not only unnecessary, it threatens the black and brown bear populations which would be killed and displaced by the stronger and more territorial grizzly. There is already a scarcity of food supply for native brown and black bear in the N. C.

Don't believe the rhetoric presented by the Grizzly Bear and USFW proponents. There is little evidence

that historically Grizzlies roamed the N. C. Reliance on Hudson Bay records proves to be sketchy at best, and non-specific as to the actual trapping and kill locations. Being huge omnivores, Grizzly require a lot of food energy. Grizzlies do kill; livestock and humans. A lot of folks are getting tired of hearing those human deaths referred to as "tragic accidents," allowing them to continue until the next encounter.

The grizzly range is stated in hundreds of miles. It is simply wrong to assume that over the last 100 years the Canadian grizzly population has passed up the opportunity to settle in a suitable N. C. habitat. Were the "grass greener" on the U. S. side of the border, the grizzly would have migrated south into the N. Cascades. There has been no human predation in the N. C. for over a hundred years...no human threat! No hunting. An estimated 691 grizzly bear live in Alberta, 65 of them in Banff National Park. The existing black and brown bear perform the ecological need of "apex predators" (omnivores) through weak species management (killing weaker species), scat dissemination, and improving forest health. The smaller bear do that, essentially without the distinct threat to cattle, goats, sheep, and people (public safety) who enjoy the N.C. backcountry.

Farmers and ranchers, already assaulted by Wolves, dread the presence of Grizzlies in their grazing pasturelands. This Plan for forced reintroduction encourages farmers, hikers, home owners and campers to "haze and annoy" bear that they come into contact with. That very interaction is incredibly risky for humans. Grizzlies attack and kill humans with non-specific provocation. People often carry food, and people are attacked as food. it could be your granola bar...or your butt...that is a meal for the taking. And, your nylon tent and bear spray are not adequate deterrents. Unless you own a Anatolian-bred dog, your family pet is Grizzly food. The couple killed in Banff emptied their can of bear spray, and then were attacked by the annoyed angry bear. Grizzly are far more often going to stand their ground, or attack.

Do not think that you are protected by park boundaries or NPS personnel. Your death or injury can occur before Fish and Wildlife and park department personnel can apprehend a rogue Grizzly. A recent killer Grizzly journeyed through the mountainous states of Montana and Idaho, avoiding several attempts to trap it. That trapping failure resulted in the death in Yellowstone of school teacher Amie Anderson on July 22, 2023. That same Grizzly was responsible for an earlier attack in Idaho...two years earlier...when it broke through a kitchen window.

Being omnivores (flesh eaters), Grizzlies are far more likely to attack anything protein, including defenseless farm animals and humans. Humans are another form of "fast food" for grizzlies. Earlier this month a man and woman, both experienced backcountry travelers, emptied a can of bear spray, and then were mauled to death by a Grizzly in Banff National Park. Also this year, Montana officials euthanized a grizzly, likely stressed and hungry, who had broken into a home and fatally attacked a woman earlier in the summer. In 2018, a grizzly bear, which authorities described as starving, killed a woman and her baby in Yukon, Canada. In Yellowstone, 8 visitors have been killed, and hundreds have been attacked.

Since being protected by the Endangered Species Act in 1970, the U S population of Grizzlies has dramatically recovered. As Grizzly bear populations increase, and inadequate local food supply remains static or is reduced by global warming, human killings and injury events will only increase...as they have. Animals in general will not move away from a food source until it is gone. Once the food supply is exhausted, territorial bear (particularly mother bear and their cubs) will strike out for a new hunting ground. By then they are hungry, malnourished, defensive, and more aggressive, as their bodies tell them that they and their cubs need to store more body fat for the upcoming hyperphagia (hibernation) period. The act of breaking into a human home in the fall often represents a starving bear trying to provide food for their cubs, and being willing to take extreme measures to get at the food that they smell. This is a dangerous animal!

Alaska averages four fatal bear attacks per year. Why would the residents of Washington State promote or allow this kind of unprovoked animal violence toward humans, which is usually fatal to the Grizzly bear (death by game officials)?

In the Rocky Mountains, grizzly are increasingly moving into the valleys and prairies, wandering onto golf courses, breaking into homes, stalking chicken coops, and raiding cornfields. Montana and Wyoming are home to over 2100 grizzlies, with a population also in Idaho. Containing grizzlies will inevitably result in more powerful preventive measures. This NPS Plan for forced reintroduction will lead to taller and stronger fence lines, electric fences, and other measures that will lead to travel restrictions of other wildlife populations. Out of necessity, the NPS will develop its own "permitted areas" restricting recreationalists and preventing access into popular areas of the MC. Family dogs, often thought of as family protection, will be restricted in wilderness areas even further. It has been found that bear spray (5'-10') does not prevent close-up encounters, and is an unreliable defense against a powerful and aggressive Grizzly.

Preventive conflict approaches will include human use restrictions on bear attractants such as garbage, dumpsters, compost, bee hives, fruit and vegetable gardens, free-roaming chickens, and family pets. Some say that "a fed bear is a dead bear." Secure storage of bird seed, pet food, putting electric fences around school facilities and adding playground guards are only deterrents to breaking-and-entering bears. Bears have Missoula, Montana hemmed in and are making forays around the edges, says Russel Talmo, a specialist in bear conflict resolution with Defenders of Wildlife.

Grizzly proponents hope that as the grizzly population expands, the areas between the five island ecosystems established by the Endangered Species Act will allow grizzlies to move between them. The N. C. is but one of the five large ecosystem areas. Much of this territory is crisscrossed with private property, roads, and is crowded with people, towns, cities, cattle, sheep, beehives, fruit and vegetable gardens, and...recreation. These human uses are inconsistent with a large, foraging, aggressive grizzly population...a bear population opposed to turf sharing. After a human fatality, it is not uncommon for authorities to close those recreational areas to human use.

An adult Grizzly can weigh several hundred pounds, can stand more than 8 feet tall, can run up to 35 miles per hour for a prolonged time, and is no match for unarmed human beings. If you plan on being in a known Grizzly territory:

Carry and know how to use a suitable firearm

Carry and know how to use bear spray

Wear bear bells, and make noise

Travel in groups, even as hunters of other game

Have a strong dog breed (Anatolian-type) which is extremely loyal and highly protective

Plan to be out in daylight hours

Do not rely on a tent at night

Never keep food sources near your person

If fishing or hunting, immediately wash the smell of your kill from your hands and body

If you have been cooking or eating, wash the smell from your face and hands

Avoid sites and concentrations of ravens and other scavengers

The NPS and the USFWS are both now proposing EIS alternatives that include the forced capture and release of out-of-state

grizzlies--catch and release programs with "zoo-like" monitoring. Once begun, these programs will likely morph into feeding programs to sustain the starving transplants, and expensive and ongoing monitoring programs to keep the migrating Grizzlies away from domestic farm animals and local communities. So, why another expensive, unnecessary, and unwanted "zoo" monitoring experiment? Vow: vote (letter) could count!

Currently, the Canadian Grizzlies could walk across the unmanned border into the Washington North Cascades...but they have not. Why? Because the grass is greener where they are! Leave the Grizzlies where they are successful. Vote to eliminate the N. Cascades Ecosystem from the US Fish and Wildlife Recovery Zones, and vote for the no-action alternative in this EIS!

This grizzly program, if implemented, is guaranteed to result in MORE Federal and State government intrusion into your everyday lives. And you will pay the extraordinary costs of this ill-conceived and unnecessary program.

Vote to eliminate the N. Cascades Ecosystem from the US Fish and Wildlife Recovery Zones, and vote for the no-action alternative in this EIS!

Along with responding to this call for public comment, contact your W.S. representatives with your opinions.

[List of congressmen contact information.]

Your opinion is being requested by two Federal agencies. Write your letter opposing this unnatural and consequential interference

Please take the time to respond to, and object to, all but the "No Action" alternative being offered in this EIS.

Correspondence: Dear Superintendent,

I would urge you to resend the draft EIS and the proposed 10j rule. The introduction of grizzlies into the North Cascades would be devastating for our North Central communities. At the present time, the wolves are being sufficient predators to the game population and livestock in these areas.

The threat grizzlies would bring to hikers, campers, and people enjoying the beauty of the park would be alarming.

The potential loss and damage for livestock producers certainly needs to be considered.

When reading that the majority of comments concerning this matter were from outside our state of Washington seems unfair. These people would not experience the possible devastation that local people would face.

Again, please do not consider moving forward with the introduction of grizzlies in this area.

Correspondence: Dear Superintendent Striker:

The Yakima Valley Audubon Society (YVAS) Board of Directors met on October 10, 2023, and discussed the Draft Grizzly Bear Restoration Plan / Environmental Impact Statement, North Cascades Ecosystem (Draft Restoration Plan).

Our YVAS Board voted on October 10, 2023, to support either of the two Action Alternatives described in the Draft Restoration Plan, either Alternative B, or Alternative C. YVAS will support implementation of either of these two Action Alternatives to restore Grizzly Bears to the North Cascades Ecosystem, and we are content to leave the choice of which alternative to implement (Alternative B or Alternative C) up to the discretion and judgment of the National Park Service and the United States Fish and Wildlife Service.

YVAS believes it is imperative that Grizzly Bears be restored to the North Cascades Ecosystem. We at YVAS absolutely do not support the no action alternative.

I intend to go to your Draft Restoration Plan comment webpage right now and submit these YVAS comments online. I'm redundantly writing you this letter to emphasize our YVAS position in support of either Action Alternative B or Action Alternative C to restore Grizzly Bears to the North Cascades Ecosystem.

Thank you for the opportunity to comment on the Draft Grizzly Bear Restoration Plan. And thank you for taking this initiative.

Sincerely,

████████████████████ Conservation Committee Chair
Yakima Valley Audubon Society

Re: Friends of Animals' Comment on Draft Grizzly Bear Restoration
Plan/Environmental Impact Statement North Cascades Ecosystem -
September 2023

To Superintendent Striker:

Friends of Animals submits this comment in response to the National Park Service (NPS) and the U.S. Fish and Wildlife Service's (FWS) (collectively, "Federal Agencies") joint notice seeking comments on the Draft Restoration Plan and Environmental Impact Statement for the North Cascades Ecosystem in Washington State.

Friends of Animals is a non-profit, international animal advocacy organization incorporated in the state of New York since 1957. Friends of Animals has nearly 200,000 members worldwide. Friends of Animals and its members seek to free animals from cruelty and exploitation around the world, and to promote a respectful view of non- human, free-living and domestic

animals. Friends of Animals' activities include educating its members on current threats to many species' abilities to live in ecosystems free from human manipulation, exploitation, and abuse; and monitoring federal agency actions to ensure that laws enacted to protect the environment and wildlife are properly implemented and enforced.

FACTUAL BACKGROUND

For thousands of years, "[g]rizzly bears roamed across the North Cascades . . . as an essential part of the ecosystem, distributing native plant seeds and keeping other wildlife populations in balance."¹ At one point, there was an estimated 50,000 grizzly bears inhabiting a large contiguous portion of the United States, comprised primarily of eighteen western states, including the State of Washington.² As with many wildlife species, the grizzly bears of the North Cascades suffered catastrophic depredation resulting from interactions with humans, hunted nearly to extinction during the 19th and 20th centuries, losing critical habitat to logging, development, indiscriminate hunting, the ranching industry, and bounty programs funded by the U.S. government. Despite thriving in the North Cascades for centuries, there have been no confirmed grizzly bear sightings in the U.S. portion of the North Cascades Ecosystem (NCE) since 1996.³ The last photographed grizzly bear in the U.S. portion of the NCE is depicted in a 1967 photograph in the Draft Restoration Plan, presumably killed by the armed man proudly posing next to his kill.⁴

Under the Federal Agencies' 2023 Candidate Notice of Review (CNOR), it was determined that the NCE no longer holds any population of grizzly bears, supported by a lack of evidence and an absence of detections of grizzly bears in the region.⁵ FWS, therefore, considers Grizzly Bears to be "functionally extirpated in the NCE."⁶ While grizzly bears are not known to presently inhabit the U.S. portion of the NCE, five studies have concluded that the U.S. portion of the NCE has sufficient habitat resources essential for the maintenance of grizzly bear populations and confirm that the U.S. portion of the NCE can support a viable population of 200 to 400 grizzly bear individuals.⁷

Due to the historically declining populations, grizzly bears were listed as "threatened" under the Endangered Species Act in 1975 (for the lower 48 states) and as "endangered" in Washington in 1980. In 2004, a grizzly bear recovery plan was completed for the British Columbia portion of the NCE to reestablish the population of grizzly bears in the region. However, the Washington State portion of the NCE is without a restoration plan, as the EIS process commenced in 2014 was terminated in 2020.⁸

On November 14, 2022, the Federal Agencies published notice in the Federal Register seeking scoping comments from the public to assist their joint preparation of a North Cascades Ecosystem Grizzly Bear Restoration Plan (the "Restoration Plan") and Environmental Impact Statement (EIS) in the North Cascades.⁹ The Federal Agencies' stated goal at that time was to restore the biodiversity of the NCE and support the recovery of grizzly bear populations to facilitate removal from the Federal List of Endangered and Threatened Wildlife.¹⁰ In drafting the proposed Restoration Plan, the Federal Agencies explored three preliminary alternatives to achieve restoration of grizzly bear populations in the NCE.¹¹ Alternative A was the "no action" alternative; Alternative B would restore grizzly bears in the NCE with the existing protections under the BSA; and Alternative C, in which grizzly bear populations would be restored in the NCE through translocation from another GB population and designated as a Rule 100) nonessential Population under the ESA.¹² Each "action alternative" has as a goal "to restore a self-sustaining population through the capture and release of grizzly bears into the NCE."¹³ Each preliminary alternative promotes public education and outreach, establishing guidelines for managing conflict, sustainable habitat management, and improved sanitation on public lands." Ultimately, the Federal Agencies seek to release 3 to 7 bears per year for 5 to 10 years to establish an initial population of 25 bears to serve as a foundation to allow reproduction and an eventual population of 200 bears in 60 - 100 years.¹⁵

On September 28, 2023, the Federal Agencies, through the NPS, commenced a period for public comment on the Draft Restoration Plan and Environmental Impact Statement regarding the reintroduction of grizzly bears into the NCE.¹⁶ The goal is to restore grizzly bears to the NCE, contribute to the restoration of the NCE's biodiversity, and enhance the long-term survival of grizzly bears for multiple populations to the point

that the species can be removed from the Federal List of Endangered and Threatened Wildlife.¹⁷ As a result, the Federal Agencies hope to achieve the objective of restoring bears to their natural and cultural heritage in the NCE, support environmental and natural resource goals in the NCE, and provide a source of outreach to inform and educate the public on grizzly bears in their natural habitat.¹⁸

While the Restoration Plan addresses three alternatives, the Federal Agencies chose Alternative C as the preferred alternative. In Alternative C, a Nonessential Experimental Population (NEP) of grizzly bears would be established in the U.S. portion of the NCE under section 100) of the ESA. "Establishment of the NEP is intended to support reintroduction and recovery of grizzly bears within the NCE and provide the prohibitions and exceptions under the [ESA] necessary and appropriate to conserve the species within a defined NEP area."¹⁹ FWS almost simultaneously published in the Federal Register the proposed rule under section 100), essentially seeking comment on Alternative C before issuing a final Restoration Plan and EIS.

Friends of Animals supports the restoration of grizzly bears in the NCE. As noted in the Draft Restoration Plan, a "habitat evaluation and a report by the Interagency Grizzly Bear Committee (IGBC) NCE Subcommittee, concluded that the U.S. portion of the NCE contains sufficient habitat quality to maintain and recover a grizzly bear population."²⁰ Restoring bears to an area they inhabited for centuries is necessary for the sustainability of the endangered grizzly bear species and critical for nurturing a healthy ecosystem in the U.S. portion of the NCE. Friends of Animals supports the reintroduction of grizzly bears to their native ecosystem with the most protections available under the ESA, not as a nonessential experimental population as outlined under Alternative C. While Alternative C is the Federal Agencies' preferred alternative to establishing and protecting grizzly bear populations, this alternative allows for "taking" and "management" of grizzly bears outside the scope of the full protections of the ESA, including through lethal means. This type of lethal management would comprise the goals of restoration and inhibit the recovery of grizzly bear populations.

Federal Agencies must implement "management" techniques that prioritize the preservation and protection of the grizzly bears reintroduced to the NCE. Friends of Animals is concerned that use of 100) rule for a nonexperimental population may give a louder voice not to the bears protected by the ESA, but to the ranchers and hunters who believe that management of bears should allow for unfettered removal of any bears reintroduced.

DISCUSSION

Friends of Animals supports restoring grizzly bears to their native habitat in the NCE as an initial step to establishing sustainable grizzly bear populations. Grizzly bears are an apex predator and a keystone species in the NCE, vital to a healthy and thriving ecosystem. In selecting a proposed alternative, Friends of Animals encourages the Federal Agencies to consider the positive effects reintroduction of grizzly bears will have on the NCE, as well as the positive socioeconomic benefits of a thriving population, such as a thriving recreation and tourism industry based on a thriving ecosystem. The Federal Agencies should prioritize minimizing management and human contact with bears, as each will lead to using lethal means justified as "management." Friends of Animals encourages the Federal Agencies to select an alternative that will lead to the recovery of grizzly bears. Federal agencies should reject lethal "management" methods to resolve perceived conflicts with farmers and ranching industry because such methods are unethical and comprise the recovery of grizzly bears.

A. The Federal Agencies should follow the ESA in the way that offers the most protection for the Grizzly Bears in the NCE.

Congress enacted the ESA to protect and preserve endangered and threatened species, their respective habitats, and the ecosystems on which these species and habitats depend.²¹ The goal of the ESA is to recover listed species to the point where they no longer need legal protection.²² The grizzly bear is presently listed as a threatened species under the ESA, being first listed in 1975.²³ Section 7 of the ESA "provides . . . valuable and powerful tools to conserve listed species, assist with species recovery, and help protect critical habitat."²⁴ Section 7 also requires federal agencies to consult with the U.S. Fish and Wildlife Service and proposed actions that may affect a listed species." To facilitate reintroduction of a threatened or endangered species, ESA section 100) allows for the reintroduction of experimental populations of threatened or endangered species into historical ranges and habitats in which the species is no longer found. Section 100) was placed into the ESA to allow for the reintroduction of displaced species through experimental populations with management of the reintroduced species through regulatory measures. Section 100) was implemented to ease the concerns of private landowners, other federal agencies, Tribes, and state and local governments regarding management of the reintroduced species.²⁶ As the Federal Agencies note, "[a]n experimental population is a group of reintroduced [species] that is geographically isolated from other populations of the species and is typically considered nonessential to the survival of the species as a whole."²⁷ In establishing an NEP under section 10 (j), the agency must "treat any population determined by the Secretary to be an experimental population as if we had listed it as a threatened species for the purposes of establishing protective regulations under section 4(d) of the Act with respect to that population."²⁸

In the draft Restoration Plan, the Federal Agencies considered Alternatives B and C with reference to restoring grizzly bears to the NCE with existing protections under Section 7 of the ESA (Alternative B) and restoration with a 100) nonessential experimental population under the ESA (Alternative C).²⁹ Friends of Animals encourages the Federal Agencies to craft the final Restoration Plan so that grizzly bears receive the most protections available as listed species under the ESA.

B. The Final Restoration Plan should account for the positive effects grizzly bear reintroduction will have on wildlife in the NCE.

Grizzly bears were present in the NCE for thousands of years, an apex predator and vital species playing a critical role in a thriving ecosystem, before suffering near complete population loss in the 19th and 20th centuries. Development, logging, hunting, and other forms of human activity decimated the grizzly bear and its habitat as human populations spread into the natural ecosystems in which grizzly bears formerly thrived for millennia. As a result of hunting, logging and population and development expansion, grizzly bears were rendered extinct from the U.S. portion of the NCE.

As a keystone species in the historical boundaries of the NCE, grizzly bears provided a positive impact and played a critical role in a thriving NCE before removal from the ecosystem. Complete removal from the ecosystem damages the delicate and critical balance of the ecosystem. Reintroduction of grizzly bears will benefit the NCE by returning the ecosystem to a condition more like the thriving ecosystem that existed for thousands of years, before human intervention proved grave to yet another keystone species.

The Federal Agencies acknowledge the critical importance of grizzly bears in a thriving NCE and must explore alternatives that return grizzly bears to their natural place within the ecosystem. As a predator, grizzly bears play a role in managing the populations of the species upon which they prey, maintaining a healthy balance of wildlife within the NCE. However, 90% of a grizzly bear's diet consists of vegetable and insect matter, as opposed to livestock or other sources of meat." The impact on existing

wildlife populations, while positive for management of population levels, would not be detrimental or beyond what the ecosystem can tolerate. Affording grizzly bears the full protection of the ESA would allow grizzly bear populations, and the NCE, to thrive while minimizing the impact of humans and management methods that could be potentially lethal.

Grizzly bears further enhance the ecosystems they inhabit by spreading seeds through their eating and traveling patterns, and help aerate the soil while rooting for sustenance, thereby playing a critical role in the ecological health of the NCE plant life. Spreading seeds and assisting in health plant ecology assists not only the grizzly bear population, but also the wildlife that relies on that plant life. The Federal Agencies should ensure that the final Restoration Plan protects and encourages the conservation of grizzly bears, maximizing their beneficial role in improving the ecological diversity necessary for a thriving ecosystem, rather than placing as a primary emphasis the management of grizzly bears for the benefit of humans. Affording grizzly bears the full protections of the ESA will promote the Federal Agencies' stated goal of increasing the biodiversity of the NCE.

C. The Federal Agencies should craft the final Restoration Plan to account for the role humans play in minimizing human-grizzly bear interactions.

In the draft Restoration Plan, the Federal Agencies considered the "Visitor Use and Recreation Experience" in the NCE.³¹ Hiking, camping, wildlife viewing, and boating are just a few of the many recreational activities people pursue in the region.³² Grizzly bear reintroduction into the NCE should not limit the ability of people to engage in these activities, as the limited number of bears slowly introduced should not lead to significant encounters, as the NCE is comprised of roughly 10,000 square miles and includes vast areas in which the difficult terrain limits the ease with which humans may participate in recreational opportunities. However, recreational activities should be permitted only to the extent the activities do not adversely affect the wildlife in the NCE or will not increase the possibility of human-wildlife conflict. The final Restoration Plan must include measures to educate the public on how to enjoy outdoor activities in areas where interaction with bears may occur and measures to enforce responsible human

behavior. While grizzly bears generally seek to avoid interaction with humans, people should still be required to carry bear spray, and groups should be limited in size through a permit system. People should also be educated on minimizing interactions with grizzly bears and how to respond if encountering a grizzly bear. Importantly, while people are encouraged to enjoy recreational activities in and around the NCE, the Restoration Plan should also include severe restrictions on hunting and encourage people to use non-lethal means to respond to and to deescalate interactions. The best way to realize this vision is to select an alternative and craft the Restoration Plan in a way that gives grizzly bears the full protections of the ESA.

Notably, in the draft Restoration Plan, the Federal Agencies compare Alternatives B and C in the category of "Incidental Take and Section 7 Consultation." In Alternative B, incidental takes must be pre-authorized through consultation with the FWS and "[p]ersons may not intentionally take a grizzly bear, unless . . . necessary for defense of life."³³ On the contrary, Alternative C, in which a 10 (j) NEP would be established, incidental takes would be allowed without pre-authorization or consultation with FWS.³⁴ Such a "kill first, ask permission later" approach will surely lead to incidents in which grizzly bears will be needlessly killed, but later permitted through justifications developed after the fact. The Federal Agencies should place as paramount the protection of grizzly bears and afford the species the full protections of BSA section 7.

The Federal Agencies should also consider the cultural and socioeconomic effects of reintroducing grizzly bears in the NCE. Grizzly bears thrived for thousands of years in the region and are of great significance to the culture and traditions of Indigenous communities in and around the NCE.³⁵ A thriving grizzly bear population will draw people from around the United States, as well as internationally, for the opportunity to see a thriving ecosystem in which grizzly bears play a critical role. An increase in people traveling to the region to view the wildlife and participate in other recreational activities will, inevitably, benefit the economy of the local communities in the region.

The Federal Agencies should consider these positive impacts when finalizing the Restoration Plan and select an alternative that best outlines measures to limit interactions with bears when engaging in recreational activities. The Federal Agencies must include limitations specifically requiring recreational users to be diligent in preventing human-bear incidents and to be prepared to deescalate or minimize effects when encountering a bear, whether the interaction is intentional or inadvertent.

D. The Federal Agencies should prioritize protections for grizzly bears over livestock grazing.

It is to be expected that ranching and farming interests in the region generally oppose the reintroduction of grizzly bears because of the belief that grizzly bears could kill livestock and reduce their profits. These industries often claim that grizzly bears harass livestock, threaten humans, and consume significant orchard products. But ranchers and farmers face these same concerns from other species wherever non-native livestock populations are raised for human consumption, including regions in which populations of grizzlies and other bears presently thrive.

Contrary to the "sky-is-falling" protests by ranchers and farmers, the Federal Agencies have previously noted that a U.S. Department of Interior formula indicates that there could be just three livestock deaths per year when the grizzly bear population reaches 200 bears in 60 to 100 years.³⁶ In the draft Restoration Plan, the Federal Agencies stated "the total number of cattle and sheep depredated within the NCE would result in minimal, adverse impacts on agriculture and the livestock grazing industry, contributing to less than 0.01% of the total number of cattle and sheep" in the region.³⁷ The extent of this projected depredation would be impacted by the size of the grazing operation, the extent to which there is overlap with grizzly bears, and the presence of rancher--based attractants, such as orchards, beehives, livestock boneyards, and cattle and sheep calving areas. Further, the impacts are "less likely to occur given that no staging or release areas would overlap active grazing allotments."³⁸ And to the extent any ranching operation may suffer depredation of livestock "units," such ranching operation would possibly enjoy compensation for any loss, either through insurance or as authorized under Washington State law.

The Federal Agencies should include in the Restoration Plan provisions to educate ranchers and farmers on methods to minimize interactions with grizzly bears, including electric fences, bear-proof trash receptacles, bear-proof food canisters, and non-lethal methods of managing and deescalating interactions between humans and domestic animals (including livestock), and grizzly bears. Friends of Animals also urges the Federal Agencies to take a hard look at how ranchers and landowners will use an "experimental population" designation under section 100] of the BSA and ensure "more flexible" management methods will not lead to escalated deterrence methods or lethal means of "management." The draft Restoration Plan allows for deterrence of grizzly bears "from the immediate vicinity 600 feet (200 yards) of a human-occupied residence

or potential conflict area with humans, such as a barn, livestock corral, chicken coop, grain bin, or schoolyard."³⁹ However, there should also be requirements regarding control of attractants to preemptively avoid a situation that may lead to use of deterrence methods.⁴⁰ Requiring ranchers and landowners to minimize attractants would also potentially negate the need for the lethal control authorization or permits contemplated by Alternative C with a 10(j) designation, making it easier to implement Alternative B and afford grizzly bears the full protections of the ESA.

Alternative C, with a 100) NEP, allows for hazing and other deterrence methods based only on the reported location of the grizzly bear, not taking into consideration the actual level of threat, if any, presented by the bear and the presence of attractants placed by the human landowner. Further, when specifically addressing livestock, the draft Restoration Plan and proposed 10(j) rule allow for lethal taking of a grizzly bear within 100 yards of livestock, subject to various conditions.⁴¹ But, there is little to indicate that farmers and ranchers are required to minimize attractants or better defines when lethal methods may be employed, beyond stating "when necessary for public safety or to protect public property."⁴² The best way to avoid potential "management" issues is to restore grizzly bears to their native ecosystem as fully protected species under the BSA and require that ranchers and landowners minimize attractants on their property.

At the end of the day, provisions to accommodate "management" of grizzly bears for the benefit of the livestock industry are not necessary, considering the insignificant depredation rate of 0.01%. Additionally, 2.6 million acres of the NCE is considered wilderness, identified as "untrammelled, natural, undeveloped, providing opportunities for solitude or primitive and unconfined recreation, and other features of value."⁴³ Wilderness is not characterized by residential communities or livestock grazing, and the amount of interaction humans will have with bears in 2.6 million acres with 200--400 bears in 60 years will likely be minimal.

The better approach, rather than allowing for unmonitored hazing and the use of lethal measures to prevent insignificant levels of livestock depredation, is to restore grizzly bear populations with the existing protections of the ESA. To minimize any negative effects grizzly bear restoration may have on livestock in the tiny portion of the NCE in which livestock and bears populations may overlap, Friends of Animals urges the Federal Agencies to evaluate what measures have been taken in similar situations in similar environments to minimize and avoid conflict. Efforts such as electric fences, minimizing attractants, and non-lethal methods of responding to interactions must be considered in the final Restoration Plan, rather than allowing for immediate action to be taken against grizzly bears with permission being sought after the fact.

CONCLUSION

Friends of Animals supports the Federal Agencies' efforts to facilitate the reintroduction of grizzly bears into the us. portion of the NCE. Friends of Animals encourages the Federal Agencies to select the alternative that provides grizzly bears with the greatest amount of protection under the ESA to allow for a successful reintroduction and a viable population for the future. While the Federal Agencies appear to believe the reintroduced populations must be managed to achieve success for the future, Friends of Animals requests the Federal Agencies select the alternative that minimizes the amount of human interaction with the grizzly bear populations, negating the need for "management" under section 100'). Friends of Animals encourages the Federal Agencies to select a path forward that promotes the positive impacts and effects of grizzly bear reintroduction and considers the minimal threat to farming and ranching interests that may result, requiring the public to be educated on how to coexist with grizzly bears as protected species under the ESA and without short-sighted, lethal methods of "management."

Thank you for the opportunity to comment, and please contact me if you have any questions or concerns.

Sincerely,

Re: Draft North Cascades Ecosystem Grizzly Bear Restoration Plan / Environmental impact Statement

Dear Superintendent Striker and Supervisor Thompson,

North Central Washington Audubon Society (NCWAS), with approximately 500 members in Chelan, Okanogan, Douglas, and Ferry counties in Washington State, is submitting the following comments to the Draft Environmental Impact Statement for the reintroduction of grizzly bears to the North Cascades Ecosystem.

One of the core principles of our organization's mission is to enhance, protect, and restore healthy natural ecosystems within our chapter's boundaries. Given this, we strongly support the reintroduction of native species to ecosystems that historically hosted them. And particularly so for keystone species like the grizzly bear.

The North Cascades Ecosystem (NCE) is one of the few wild and healthy ecosystems remaining in the United States outside of Alaska. Over 3,100,000 acres, it overlies areas within our chapter's boundaries. In recent years, keystone species such as wolves and wolverines have begun to filter back into the NCE, and Fisher reintroduction has been underway there for several years. Still missing, however, is the grizzly bear.

NCWAS is aware of the concerns some have expressed for public safety if grizzly bears become once again a functional part of the NCE. However, even where grizzly bears are still common, truly negative outcomes between them and people are very rare. In fact, many of the risks most people accept on a regular basis are far more likely to result in harm than would be posed by grizzly bears once again roaming the NCE.

We understand that both options B and C of the Draft EIS contain many of the same components but differ on the rules under which any resulting bear/human conflict occurrences will be handled. Regarding this, we believe that the 100) rule makes the most sense, as it will assure that any such incidences will be addressed by wildlife professionals, rather than private individuals.

NCWAS believes there is substantial value in having a few areas in our country that contain the full range of species that were present when settlers first arrived and where people need to be aware of their circumstances. The NCE can become one of those few places again. We, therefore, fully support reintroduction of the grizzly bear to the NCE and have a strong preference for Option C of the Draft EIS.

We appreciate the opportunity to comment on this important issue.

Correspondence Type: Letter

Correspondence: Dear Mr. Striker:
Oregon Cattlemen's Association offers these comments on the North Cascades Grizzly Bear Restoration DEIS. We commented on previous analyses of North Cascades Grizzly Restoration, and we write to support our counterparts in Washington. Because this proposal fails to manage grizzly bear expansion, it could result in grizzly bear conflicts for our members' operations in Oregon. We represent multi-generational family-owned operations with plans to continue livestock operations throughout the life of this proposal. We have a stake in this, and our input is substantive and deserves close consideration.
Grizzly Bear Dispersal

We strongly disagree that restoration of grizzlies should result in 200 (or more) bears dispersing to any environment of their choosing. Experience from grizzly expansion in Idaho and Montana shows that when populations expand, grizzlies move from home territories in search of food and are lured to readily available sources, such as livestock herds, municipal dumps, orchards, and grain stockpiles. Grizzly expansion in Montana is close to reaching the Dakotas. Based on this, we anticipate that the North Cascades proposal will ultimately bring grizzly bears to Oregon.

We appreciate the information presented in Figure 4, which shows that wildlife managers anticipate grizzlies dispersing throughout Zones 1, 2, and 3 in Washington.

[Figure 4 - Alternative C Management Zones]

Earlier versions of this grizzly restoration effort argued that bears would stay within 10 miles of the release site. Experience with other grizzly populations discounts this and verifies that grizzlies can disperse for hundreds of miles from initial placement.

We also appreciate the following information on Page 66 of the DEIS:

Home ranges of translocated bears could initially be several times larger than typical home ranges of resident bears, and some homing or exploratory behavior may occur where bears move long distances from their release site. Based on CYE data between 1990 and 2021, approximately three--quarters of grizzly bears are expected to remain in the NOE after translocation, and one--quarter, or an estimated 6 bears, could move out of the NOE (FWS, Kasworm pers. comm. 20230).

The current DEIS improves on past analyses in predicting grizzly dispersal. Since the DEIS doesn't address measures for ultimately maintaining a cap on the 200--grizzly population, unlimited expansion is expected,

which only increases our concerns about the effects of Alternatives B and C on our membership. As we reviewed the DEIS, however, we noticed measures (on Page 168) for residents, landowners, ranchers, and farmers to protect themselves, crops, and livestock from grizzlies that disperse into Zones 1, 2, or 3. Described as effective, one of these measures is installing electric fencing around houses, crops, and livestock. This measure inspired our proposal for a grizzly restoration effort we are naming Alternative D.

Alternative D

We request that the FEIS include in-detail analysis of Alternative D, which would introduce a population of 25 grizzly bears over 5 to 10 years into fenced blocks of core habitat within the confines of the North Cascades National Park. With core habitat surrounded by electric fencing, wildlife managers can readily monitor and support grizzly populations while minimizing risks to bears from human conflicts. This population, capped at 25 bears, would be maintained over the long term.

We believe Alternative D would benefit all grizzly populations because it requires fewer transplants from source populations while minimizing mortality from conflicts in communities throughout Washington or beyond. When genetic mixing is needed for grizzly health, a contained environment would ensure replacement bears from other populations would mix with the NOE population rather than leaving it to chance encounters by dispersing bears.

Alternative D would be more compatible with plans and policies of state, local and other jurisdictions. Washington state legislation makes grizzly introduction illegal in Washington. While Alternative D would technically conflict with this legislation, we believe the legislature's intent would be honored by confining grizzlies to federally managed lands. Grizzly bears dispersed beyond national park boundaries would certainly conflict with the legislature's intent.

We've already experienced the effects of unfettered dispersal with the Canadian wolf. The Oregon Wolf Plan's management strategies and compensation efforts haven't begun to address the losses we've suffered. Compensation requires an inspected carcass. After encounters with wolves, our livestock also suffer from wolf kills where the carcass can't be found or the specific predator confirmed, aborted calves, lowered rates of calf production, defensive behavior that makes livestock difficult to handle, and countless hours spent on nonlethal prevention measures. Alternative D would avoid this same experience from grizzly predation.

Diversity Equity and Inclusion

We believe the grizzly restoration proposal would improve with stronger engagement of the Hispanic community. Washington state has a strong and growing Hispanic community with a stake in federal actions, especially long--term projects like grizzly restoration. We acknowledge coordination accomplished between the agencies and Native American tribes. Still, we're certain that the NPS and FWS obligation to address diversity, equity, and inclusion doesn't stop when your proposal might be opposed.

According to the November 2019 NPS report on the racial and ethnic diversity of park Visitors, Hispanic visitors continue to be underrepresented in the national parks. It reports that Hispanic Americans are disinclined to visit National Parks because of cost, transportation, or they don't know much about what there is to do in national parks. The report is at a loss on recommendations because previous efforts over the past two decades haven't changed the disparity.

It's time for the agencies to try a different approach to accomplishing DEI goals. Hispanic communities associated with orchards, farms, vineyards, and ranches may not have experience with traditional agency public involvement efforts. Have you considered releasing the DEIS in Spanish? Do you have a Spanish--speaking member on your interdisciplinary team? Might Alternative D provide an opportunity to engage Hispanic communities to learn more about grizzly restoration without placing their members who work outdoors in danger? Doing the work and being an ally can't be accomplished with traditional approaches.

Environmental Justice

On Page 16 of the DEIS, the environmental justice analysis states:

It was determined that while a small number of communities adjacent to the NOE grizzly bear recovery zone may qualify as minority and/or low-income populations, these communities would not be disproportionately affected by grizzly bear restoration because restoration activities would not be focused in these areas. Therefore, this topic was dismissed from further analysis. (Page 16)

This analysis is inaccurate because these minority and/ or low-income populations will be disproportionately affected due to their strong representation in the agriculture and grazing industries. Grizzlies will be drawn to orchards, vineyards, grain fields, and livestock herds for the easy food source, increasing the likelihood of conflicts between grizzlies and members of these communities as they live, work, and recreate. Landowners will incur the cost of fencing to protect their homes, crops, and animals. This issue needs to be analyzed in detail. Alternative D would resolve environmental justice concerns by fencing the grizzlies within park boundaries, protecting these communities from disproportionate effects.

Ecological Benefits

The DEIS fails to disclose how Alternatives B or C provide any ecological benefit of grizzlies being reintroduced throughout Washington. For example, salmon restoration efforts generally bring benefits to the whole system as food sources for other species and nutrients from their post-spawning carcasses. No evidence is presented that introducing the apex predator grizzly bear fills any missing link in the complex web of an ecosystem. If anything, the analysis shows multiple examples of anticipated adverse effects on other ESA listed and unlisted species.

Does the DEIS analyze the impact of an expanding population of grizzly bears on other large carnivore predators (i.e., Mountain Lions, Black Bear, Gray Wolf) or the cumulative effects of expanding large carnivore populations on ungulate wildlife populations (i.e., Elk, Deer, Bighorn Sheep, Mountain Goats)? In some areas, these wildlife populations are already being negatively impacted by current populations of large carnivore predators. As these populations decline, increased predation of livestock and encounters with humans can be expected.

The ecosystem obviously has been working effectively without grizzlies for a long time. Since there's no compelling ecological reason to introduce grizzlies, the proposal is driven only by social and cultural issues. Alternative D does the best job of addressing those because it also minimizes conflicts with nearby communities.

Greenhouse Gas Emissions

The DEIS underestimates helicopter usage throughout the life of the proposal. While initial transfer of grizzlies is accounted for, additional helicopter time will be needed over time for removing problem bears, replacing collars, or tending injured or sick animals. We appreciated the analysis of site-specific effects of helicopter downwash on birds and other animals on Page 89 of the DEIS. We ask for similar specificity in the FEIS to quantify the greenhouse gas emissions from aviation gas or jet fuel that would be burned throughout the life of the project.

Alternatives B and C would produce more greenhouse gas emissions because the grizzly population would become larger and uncontained as it dispersed throughout the state (and beyond). Alternative D would result in minimal greenhouse gas emissions because the grizzly population would be smaller and contained, minimizing the use of greenhouse gas emitting aircraft or vehicles. Federal agencies will soon be limited to electric vehicles. Agency proposals need to reflect this upcoming change.

In 2020, Washington State passed legislation to limit greenhouse gas emissions to 45% below 1990 levels by 2030, 70% below 1990 levels by 2040 and 95% below 1990 levels with net-zero emissions by 2050. Eventually, helicopters will no longer be available for introducing and maintaining grizzly populations,

making it increasingly likely that problem grizzlies will be killed instead of relocated. These adverse long-term effects on grizzlies from Alternatives B and C are not addressed in the DEIS.

Effects on Listed Fish

Effects on ESA listed fish species consumed by grizzlies are incorrectly analyzed on Pages 89-90 of the DEIS. There could be impacts to a small number of fish consumed by grizzly bears, including bull trout, anadromous salmon, and steelhead listed under the ESA. However, the relatively small number of grizzly bears released to form an initial population of 25 bears are unlikely to affect the population viability of any fish. While there is the potential for increased adverse impacts with a restored grizzly bear population of 200 bears after 60 to 100 years, the impacts would still be limited due to the abundance of fish relative to the number of grizzly bears, even if certain individual bears were to prey on fish when seasonably abundant.

Even though grizzlies are expected to directly kill listed fish species (many of which are declining in numbers), Alternative B and C are considered Not Likely to Adversely Affect listed fish. Yet, if livestock have potential to step on one red, the determination for a livestock grazing operation is Likely to Adversely Affect. The FWS and NCAA Fisheries findings for Alternatives B and C violate ESA consultation regulations. The loss of even one fish from grizzly consumption constitutes a direct impact and warrants a Likely to Adversely Affect determination for Alternatives B and C, and a take permit must be issued.

Monitoring and action plans normally accompany Likely to Adversely Affect determinations to avoid further damage once initial take of a listed species is observed. The grizzly restoration alternatives need a monitoring and action plan to minimize grizzly effects on listed fish. Efforts might need to include hazing the grizzlies or relocating them from fish-bearing streams.

Agency Capabilities and Responsibilities

While WDFW has a program for managing black bear conflicts on private land, the FWS does not seem equipped to provide the same for managing grizzly bear conflicts. Does FWS have the necessary ground-oriented personnel and transportation methods to quickly address problem grizzlies on private land? If not, Alternatives B and C would be detrimental to grizzly survival because the public would intervene on behalf of their own safety. In small towns and suburbs, the public typically relies on local law enforcement to address safety threats. Considering the multiple demands already placed on Washington's law enforcement, it's likely that problem bears will be quickly killed if public safety is at risk. Analysis of Alternatives B and C doesn't acknowledge the mortality risk to grizzlies when dispersed throughout adjacent communities. Under Alternative D, grizzlies would be within a fenced core habitat area within the National Park and would avoid this risk. National park employees could assist FWS with management and monitoring under Alternative D.

ID Team Qualifications

We notice that the ID team are employed by WSP USA Solutions Inc, one of the largest consulting groups in the world. From social media, we understand the members work in cities such as Philadelphia, Pennsylvania; Oakland, California; Asheville, North Carolina; New York City, New York; Calgary, Canada, and Raleigh, North Carolina. We believe that their appreciation for Alternative D and their ability to analyze the alternatives would improve with personal experience of communities in the analysis area. Perhaps the contract would allow for a visit to the area by these far-flung team members so they know what they're writing about.

Canadian Translocations

We suggest a more thorough analysis of this information on Page 62:

Canadian translocation efforts have not started, and it is unclear how any Canadian efforts would impact the US portion of the NOE. Should reintroduction efforts occur in British Columbia, it is likely _ that some grizzly bears reintroduced into the Canadian portion of the ecosystem may move into the US portion of the NOE, either as a transient and return to Canada or may ultimately remain in the US.

Stating that effects are unclear is not a substitute for a thorough disclosure and discussion of what is known. Because of Canadian introduction efforts, grizzlies could enter the North Cascades Park under any of the alternatives. These effects must be investigated and disclosed in the FEIS rather than dismissed as unclear. Have the Canadians been consulted about bears that have been introduced to the US portion of NC NP moving into their portion of the park?

Interactions With Livestock

The DEIS underestimates potential livestock kill under Alternatives B and C. On Page 83 it states: More recent studies estimate that an individual grizzly bear kills 19 calves per year on the northern range of Yellowstone National Park (Barber-Meyer, Mech, and White 2008) and 7 calves per year within the Yellowstone Lake watershed, (Fortin et al. 2013).

And on Page 61, we read:

Grizzly bears are highly adaptable omnivores and are considered both habitat and food generalists that can adapt to changing food sources;

While the DEIS states livestock losses in the North Cascades might be less frequent than Yellowstone grizzlies, it doesn't acknowledge that Yellowstone is one of the proposed source areas for North Cascades grizzlies. Considering how adaptable grizzlies are to available food sources, we could anticipate the same or even larger calf losses from the North Cascades grizzly population.

The analysis on pages 143-146 of the DEIS considers only a portion of the potential effects on agriculture and livestock grazing from Alternatives B and C. Direct losses from grizzly depredation are patterned after "Montana Livestock Board numbers. However, livestock board numbers are confirmed or probable losses, which exclude a large number of losses where the predator is inconclusive or the carcass is missing. The analysis also fails to estimate losses due to reduced livestock health and reproduction from grizzly harassment, along with long hours operators would need to invest in fencing and non--lethal measures.

The DEIS estimates about 1.8 million acres of agricultural lands among the counties in and around the National Park. Many of those acres include crops and livestock that would be susceptible to grizzly damage. Why isn't the cost to landowners from fencing 1.8 million acres considered in Alternatives B and C? The cost would be extremely high, particularly since landowners only have the authority to fence their own individual parcels. Under Alternative D, fencing of core grizzly habitat within the National Park could be accomplished in large blocks and would be more amenable to maintenance. The analysis of direct, indirect, and cumulative effects on livestock co-using habitat with an expanding population of grizzly bears does not consider the full range of effects from other relevant federal actions and programs. For example, depredation from Canadian wolves is already adversely affecting livestock operations and is not considered in the cumulative effects.

Other DEIS Insufficiencies

We noticed several insufficiencies in the DEIS that insufficiently address the Council on Environmental Quality NEPA regulations, both the current version and the proposed version that recently closed the public comment period.

The Purpose and Need does not answer the questions of why here and why now. No compelling or timely

reason is provided to introduce grizzlies into the North Cascades. Similar to previous versions of this proposal, the DEIS proposes 200 grizzlies, a target number developed decades ago by a team of government employees who have probably long since retired. Wildlife managers and the public have learned a lot about grizzly and human interactions in the meantime, and the purpose and need for grizzly restoration in Washington needs to be updated.

The document's 'effects analyses. for Alternatives B and C does not match the alternative description. While effects of the next 5 to 10 years are analyzed, most long-term effects are absent or dismissed as unknowable. Yet, these alternatives describe ongoing grizzly release efforts over the next 60 to 100 years. The project length and effects analysis periods need better coordination. At a minimum, adaptive management steps and measures must be discussed for long-term projects. Since predicting effects 100 years from now is meaningless, we suggest developing and adopting Alternative D. This would allow a discrete project period of 5 to 10 years for reaching a population of 25 bears to be managed at that level over time.

The effects analysis lacks site--specificity. For almost all issues or resources, the effects of Alternatives B and C are the same, indicating a limited range of alternatives that does not address the key issues. Including Alternative D in the FEIS would improve this range, although much greater site-specific analysis would be needed for all alternatives. Inviting the team members to visit the state would also help them provide site-specific analysis.

This effort has a history of poorly staged decision--making from the start. While the DEIS recognizes that grizzly restoration will trigger future decisions by the Forest Service, it does not address the effects of those decisions in any detail. Any known effects of an action must be disclosed instead of deferred to a future decision. This staging issue would be properly handled by including the Forest Service as a cooperating agency with a new Notice of Intent. Then a new DEIS could be released to disclose the effects of grizzly restoration on the national forest. The current DEIS is very weak on this point and is a point for successful administrative objection and litigation. Please notice that Alternative D avoids this procedural weakness as grizzlies would be physically confined to the national park.

Conclusion

Finally, we ask you to consider how much public trust of federal government and its contractors has eroded in the last four years. Although public health agencies stated the vaccine would stay in the arm, we are learning its contents are now found in every organ of the body. Safe and effective has proven to be more a slogan than a reality. Stating that grizzlies will mostly stay in the park or that problem grizzly encounters will be rare is eerily similar to recent public health messaging. You might reflect on the growing public unrest with government decisions made in the name of science that result in unfortunate consequences to public safety. We've never seen mistrust of government this high. If the agencies want to repair their reputation, we suggest they carefully consider the temporal and spatial consequences of their proposals and clearly share those with the public before decisions are made.

Thank you for considering our input, and we look forward to an FEIS that values grizzly survival and community engagement and safety. If you have any questions about our input, please contact Tammy Dennee, Executive Director at 503--361-3941.

Sincerely,
OREGON CATTLEMEN'S ASSOCIATION

Correspondence: SUBJECT: Pilchuck Audubon Society comments on the Draft Grizzly Bear Restoration Plan/Environmental Impact Statement for the North Cascades Ecosystem (NCE)

Dear Superintendent Striker:

Pilchuck Audubon Society represents 1500 members in Snohomish County and Camano Island, Washington State. We support the purpose and need of the Draft Environmental Impact Statement (DEIS) and the 101' Rule to restore the grizzly bear to the North Cascade Ecosystem (NCE), as proposed by the National Park Service (NPS) and the US Fish and Wildlife Service (FWS).

In this proposal, the North Cascades National Park Complex would anchor the recovery area.

It has been 48 years since the Endangered Species Act (ESA) of 1975 established a list of species to be restored. The grizzly bear is among those species.

Support for Recovery

We support reintroduction of grizzly bears into remote areas with grizzly bear habitat on federal lands adjacent to and encompassing the North Cascades National Park Complex.

We support Alternative C. The NPS and USFWS would implement an ecosystem evaluation approach to grizzly bear restoration, wherein three to seven grizzly bears would be released into the NCE over five to 10 years. We support the goal of establishing an initial population of 25 grizzly bears before switching to adaptive management. It is an expectation this small, nonessential experimental population will reproduce over the 60-100 years, achieving a self-sustaining population of 200 grizzly bears over the six million acres of the NCE.

Ideally, that population will lead to a delisting of the grizzly bear from its current threatened ESA status.

The benefit in starting slow with Alternative C's significant emphasis upon monitoring and evaluation is to learn how this small number of bears behaves in the NCE.

The 100' Rule enables significant flexibility in managing a population toward restoration. This important provision in the ESA allows considerable flexibility in managing a species being restored. For example, grizzlies that get into conflict situations can be hazed, captured, moved, or killed. However, the 10j Rule applies only with a species believed to no longer be present when restoration efforts begin. That is not a qualifying problem with the NCE. There is no evidence of a sustainable grizzly bear population now present.

Caution for Marbled Murrelet and Northern Spotted Owl Areas

We are concerned about the inevitable use of helicopters in transporting grizzly bears and NPS and USFWS personnel to remote release sites.

Pilchuck Audubon Society's primary concern is potential adverse impacts to both the Marbled Murrelet and Northern Spotted Owl populations. These impacts could result in disturbance from helicopter flights near nesting chicks and fledglings occupying forests located near the flight operations bases. This also would affect where some grizzlies may subsequently be relocated within the NEC.

Without knowing the specific sites to be used for landings, approaches to same, and travel routes between the sites, we must assume some of the routes will be over or near sites occupied by these birds. It is imperative the NPS and USFWS consult with USFS wildlife biologists as to presumed areas of occupancy on National Forest System lands. This would be especially important regarding Marbled Murrelets' seasons of occupancy and travel between chicks, fledglings, and the Puget Sound food sources.

Northern Spotted Owl nesting generally occurs from about February to August, and parental care can extend into September. Although based on observations of the Mexican Spotted Owl, as a precaution here in the PNW, it is assumed owlets are particularly vulnerable to disturbance by helicopter noise if the distance is less

than 105 meters (344 feet) from helicopter to owl (Delaney et al, 1999). As the likely relocation work of the bears won't occur until early summer, possible interactions are not likely until late May into the fall months. Marbled Murrelets use mature forest stands for nesting. There are known nesting areas in the western Washington areas considered for your operations. The typical nesting season is thought to start in April and fledgling occupancy run into late August, although predominately reported to end in early August. However, the habits observed 20 years ago (Hammer et al, 1995) may be changing.

We recommend helicopter flights be a minimum 345 feet above known nesting areas, and that flight plans be altered to avoid nesting by using a minimum buffer of 300-600 feet. We ask that feeding flight paths be avoided during early morning and early evenings, usually designated as being two hours before and after sunrise and sunset, as these are the times when Marbled Murrelets are most actively feeding their offspring with flights between the mountains and Puget Sound.

We think more should be specifically stipulated in the subsequent flight operations manual about avoiding adverse impacts upon these species' occupancies and travel routes. This includes especially the lower elevation landing zones where bears will load into helicopters and be flown to and from the field release sites. US Forest Service wildlife biologists should be consulted to determine areas to avoid.

Conclusion

We wholly agree upon the importance of restoring grizzly bears to at least some of the North Cascades Ecosystem in which they were once abundant, and now, it seems, are entirely absent with no evidence of residential occupancy except by a rare, solitary roaming bear.

Pilchuck Audubon Society joins with fellow conservationists whose focus is on wildlife beyond birds to support restoring a too-long absent sustainable species in the North Cascades. it makes for good stewardship that at least some of the North Cascades Ecosystem regains more natural and cultural diversity and wildness!

We welcome the ample opportunities for public information and comment during this particular round of public workshops, and appreciate the previous engagements to determine attitudes and values of the highly diverse stakeholders.

In response to the National Park Service (NPS) news release (9/28/2023) seeking comments on the NPS draft EIS and the U.S. Fish & Wildlife Service proposed 10(i) rule for restoration of grizzly bears in the North Cascades Ecosystem (NCE), I write today on behalf of the federally recognized Upper Skagit Indian Tribe (Tribe) of Sedro Woolley, Washington, in support of EIS Alternative C and the Endangered Species Act proposed Section 100) designation with special consideration.

The people of our Tribe have resided in the North Cascades since Time Irnmemorial and we advocate the hereditary Indigenous perspective of a People nurtured in the very landscape in question. As such, we encourage restoration of species that have traditionally contributed to the native ecosystem's health and our wellbeing. We will- continue to speak out on behalf of those creatures who themselves cannot. In our culture, we teach our children to leave our environment in a better condition than we inherited--we know

that we borrow the present from our future generations. Today, the chain which binds all living things together in nature is broken, as so much that once was is now lost. We respect the Grizzly Bear's right to coexist, just as it did with our ancestors for thousands of years before contact with the first Europeans to enter our homeland. If we challenge the Grizzly's right to exist out of fear then we challenge our own rightful place in the landscape. In a not so distant time in our history we were once feared and many failed attempts were made to remove our people from our historical territory. Fortunately, our people endured as has our cultural responsibility and determination to protect mother nature from the collective failings of human abuse.

Upper Skagit Indian cultural affiliation to Grizzly Bear is as great as its cultural affiliation to the North Cascades, the bear's natural habitat. A large body of ethnohistoric, ethnographic, and archaeological evidence demonstrates that the Upper Skagit People represent the original precontact occupants of the Upper Skagit River Valley (Blukis Onat 1990; Collins 1974; Lane and Lane 1977; Miller 2023; Miller et al. 2019; Smith 1988). The Upper Skagit is the tribe that historically occupied, and is most culturally affiliated with, the northern portion of the area that is designated Management Zone 1 of the proposed 10(j) rule. The Tribe's ancestral villages and camps extended along the length of the Skagit River and all its tributaries, where Upper Skagits hunted Grizzly Bear (Collins 1974:52).

The Tribe's history, culture, and identity is so intertwined with Grizzly Bears and the NCE landscape that it is impossible to separate them. In the Lushootseed language spoken by Upper Skagit People, Grizzly Bear is called *tebtabol'* (Bates et al. 1994:1219, 317) and this word origin exists today in the North Cascades place names, such as the "Stetattle" River, where Upper Skagit Indian elder Charlie Moses lived seasonally until 1898 (see Fig. 1 below; Shone 2005; USIT 2019). This map name first appeared in the notes and sketches of explorer George Gibbs about 1858 and later in the U.S. Boundary Commission's 1866 map of "The Western Section", where the entire northern reach of the Skagit River is labeled as the "Steh--tatl Valley" (see Fig. 2 and U.S. Boundary Commission 1866). Not only was Grizzly Bear traditionally hunted, it was also a spiritual being who conferred hunting prowess on those individuals who possessed Grizzly Bear guardian spirit (Collins 1974:150).

It is the wish of the Tribe that in exercising their federal trust responsibility, that the NPS and USFWS consider the wisdom embedded in Upper Skagit Indian traditional ecological knowledge of bears as expressed in its legends. As told to pioneering anthropologist and ethnographer June Collins by Upper Skagit elder informants eighty years ago, bears could become people, and vice versa. Based on the bear encounters and stories told to her, Collins (1974: 150) emphasized that "These folktales point to the close relations that the Upper Skagit [People] saw between human beings and bears, although they did not encourage the intimacy, which they regarded as potentially dangerous." The discouragement of intimacy with bears highlights a practical application of Upper Skagit Indian traditional ecological wisdom that respects the presence of bears and learning to coexist with them. For the Tribe, the agencies, and any others who have read the proposed EIS alternatives, Alternative C is clearly most aligned with the USIT's ancestral history and traditional knowledge.

In consideration of the above, special deference should be given to the perspective of the Upper Skagit Indian Tribe. The additional special consideration the tribe is requesting is for continued consultation throughout implementation of Alternative C.

The Upper Skagit Tribe respects the rights of others to hold viewpoints differing from ours but we will continue to stand on the side of the environment.

Scott Schuyler the Natural & Cultural Policy Representative for the Tribe will be the point of contact and can be reached at [sschuyler\(a\)upperskagit.com](mailto:sschuyler(a)upperskagit.com). The Tribe looks forward to continued consultation regarding these plans and thanks you for considering these comments.

Correspondence:	Dear Superintendent,

I say YES to restoring the grizzly bear to the North Cascades.

The phrase used on the NPS website uses the phrase "options for managing bears to reduce or avoid conflicts while focusing on recovery."

The term "management" has, in the case of reintroduction of wolves and cougars has really meant "eradication" of any animal that happens to eat a wealthy landowner's cattle (grazing on public land, mind you). You can't have it both ways. Either the human encroaching on wildlife habitat must accept that they might lose some animals, or we don't have any wildlife left. The FWS has acted as taxpayer paid exterminators in the past.

This must stop. Now. Wolves, cougars and bears of all species belong in the North Cascades.

I fully endorse and support the reintroduction of grizzlies in the North Cascades, but with the following caveats:

Do not collar them. Don't think poachers, ranchers and other yahoos with an axe to grind and a rifle to settle it don't know how to use radio tracking. The number of grizzlies in the North Cascades is currently zero. If you see one after release, it's a good bet it's one of the released ones.

Yes, collars will help to locate them, and indicate when one has been killed. But finding the shooter is impossible and even when the shooter IS caught, the punishment is nothing. I do think ear tags are a good idea.

Take initial data: DNA, scat and hair samples for identification, blood samples, and then leave them alone. They don't need to be darted every six months just to see how they're doing. Sedatives do wierd things to animals, and habituating bears to being darted merely makes the possibility of an encounter with a human in their habitat all the more likely. If possible, make any contact with humans as slight as possible, after release. I realize it will take time to get them used to their new environment.

Using bear dogs to put the fear in them will help a great deal.

Punishment for anyone caught poaching or willfully killing a grizzly should be far more punitive than Is the current case (where a poacher Is usually slapped on the wrist and told he can't "hunt" there anymore. It doesn't stop anyone.)

If someone is caught killing a grizzly for any other reason than self defense, that person should be be punished to the full extent of the law, to include prison time.

I dearly hope releasing grizzlies into the N. Cascades works. They belong there

Due to the fact that the introduction of out of state grizzly's into the state of WA would be illegal according to RCW's that are already on the state books and thus making that introduction unlawful, I see no need to comment on any EIS analysis.

What you need to hear clearly, once again, is that the citizens of WA state DO NOT WANT GRIZZLY BEARS BROUGHT INTO THE NORTH CASCADES IN ANY WAY SHAPE OR FORM!

If you persist in doing so, when the first mauling and/or death occurs, that mauling or death will be at the hands of the US Fish and Wildlife service and The National Park Service. Are you ready to have that on your conscience, let alone be criminally liable for that mailing and/or death?

Do the right thing. Back down. We the people have spoken. We don't want any more grizzly bears here other than the ones that are already here.

Correspondence: To whom it may concern,

I am writing to weigh in on the Grizzly Bear Restoration issue. We live in the Mt. Baker foothills on a very peaceful tree farm. My husband is the fifth generation of his family living here. We frequently have educational tours of our land and one consistent piece of feedback we get is how serene and peaceful it is here. I have worked a high stress job for years and have always been able to de-stress by meditating in nature, and walking and hiking our little piece of paradise. All that would change if we had to be constantly on guard for grizzly bears.

Also, I have my doubts that grizzly bears were ever in this area to begin with. I know most environmentalists really want to believe they were but I have seen no hard data to support this belief. Why not let nature take its course and if they are meant to be here, it will eventually happen. Either way, we can't go back and make the country as perfect as it was before man arrived, which often seems to be the hidden agenda of many environmentalists in our area. It often feels that salmon and grizzly bears are a priority over people who actually work on and live on the land. Shouldn't our safety and peace of mind be a priority, too?

I am strongly opposed to relocating grizzlies to the North Cascades. What we need now is practical, reasonable and logical leadership on this issue. We need to slow down and take the time to make sound decisions on an issue that will impact us all. I hope you will give serious thought to my comments and I thank you for your time.

Correspondence: I am strongly opposed to the re-introduction of grizzly bears into the North Cascades Ecosystem. Although grizzly bears were once part of this environment, much has changed since the 19005. The area in which the grizzly bears would be placed, including the Methow Ranger Station area, has increased in permanent population, visitors, hikers, and hunters. Not only does this increase the opportunity for conflicts, the thousands of hunters who come to the area have replaced the grizzly bear population as the apex predator. The need for grizzlies no longer exists as we have a healthy black bear population and the state has re-introduced wolves, which continue to flourish.

I live in the Methow Valley and am quite comfortable living among wolves, bears and cougars. But I have no desire to share my living and recreational spaces with grizzly bears.

Thank you,

RE: Draft Grizzly Bear Restoration Plan/Environmental Impact Statement

Thank you in advance for consideration of my thoughts regarding the proposal to re-introduce grizzly bears into the North Cascades ecosystem here in Washington state.

I am FIRMLY OPPOSED TO THE REINTRODUCTION of grizzly bears, as I believe the negatives far outweigh any positives.

1. The National Park Service and Forest Service are, sadly, chronically underfunded. The artificial re-introduction of grizzlies will be a costly affair, not only on the front end, but continuously as issues with the bears will need to be addressed. The money spent on the artificial introduction of grizzly bears, and the inevitable issues that will result, would be much better used to maintain trails, upkeep infrastructure and improve pay for park and forest service staff.

2. I question whether it would actually be a positive for our ecosystem to have grizzly bears present. Is the science truly settled? I think not. I will add that I do have an undergraduate degree in Zoology and studied ecosystems back in my university days, though admittedly not as a career.

3. The Cascade mountain range, as the crow flies, is not very wide and, with the amount of settled areas in the foothills on both sides of the range, human-bear conflicts will inevitably occur, both to the detriment of the bears and to the detriment of humans.

4. Areas with grizzly bears will need to be periodically closed to recreation due to various bear issues. This happens in areas such as Yellowstone. This will limit the public's use of potentially large tracts of wilderness. Why would we wish to do this when our outdoor areas are more and more crowded?

5. The Pacific Crest trail is one of America's premier hiking routes, enjoyed not only by our citizens but by outdoor adventurers from around the globe. Through-hikers travel as light as possible. The presence of grizzlies would necessitate bear proof containers and other cumbersome changes, such as the need to carry bear spray.

6. Solo hiking in areas with grizzly bears is sometimes forbidden, depending on the jurisdiction, and, even in the best circumstances, often unwise. As an experienced backpacker and mountaineer, I have greatly enjoyed the occasional solo trip into the mountains. This would no longer be possible.

7. Grizzly bears ARE dangerous. As a surgeon, I have personally provided follow-up care to survivors of bear attacks. The risk can be cited as "low" but the risk IS very real. When in the mountains, I most certainly do not wish to be continually nervous and looking over my shoulder worried about attacks either on myself, my friends, my children or my grandchildren, whom I am now introducing to the outdoors.

8. Grizzly bears are common in Canada, yet they have not repopulated here on their own. The areas north and south of our borders is remote territory and I do not think civilized barriers are enough to prevent natural in-migration. I suggest the best approach is a "no action" approach to see if grizzlies will naturally relocate to the Cascades on their own.

9. Aside from the direct cost of bringing in grizzly bears and the ongoing cost of dealing with all the problems which will subsequently follow, the artificial re-introduction of grizzly bears will result in damage to the local economies. The Cascade mountains are NOT Yellowstone where tourists drive the many roads and are thrilled at the chance to see a grizzly . . . from the safety of their car. Access to the Cascades is limited and difficult. It is not an area that can be readily enjoyed from roads or even by short hikes. Thus, having grizzly bears will not induce additional tourism. I believe the opposite would occur. Most users of the Cascades are hikers, trail runners, backpackers and/or climbers, and the presence of grizzly bears will be a deterrent to visit. Also, as stated above, the inevitable need to periodically close off areas to humans will further diminish visitation. Less visitors will cause damages to local economies which depend on those who now adventure in the area.

I am not anti-predator. I fervently wish for the grizzly bears, in locations where they currently live, to thrive and be protected. BUT speaking as someone who has roamed mountain areas all over western US and Canada, in areas both with and without grizzly bears, I am firmly opposed to the artificial re-introduction of grizzlies and thus I vote for NO ACTION - ALTERNATIVE A.

Sincerely,

Correspondence: North Cascade Ecosystem Draft Grizzly Bear Restoration Plan EIS
Public Comment

Dear Mr. or Mrs.,

My name is Charlee Trueman and I am writing to tell you my opinion on the Grizzly Bear situation.

I believe that the bears should stay wherever they are. If you move the bears to the North Cascades Mountains, you would jeopardize the lives of the wildlife and the people in that area.

The wildlife would be in danger because they don't know how to hide or out maneuver a Grizzly bear. The deer, elk, and other animal populations would be greatly effected for the worst. And that would effect the hunters. Which would effect

people's diet. And that would make people, like me, very annoyed.

The people would be effected by the far of dying. People like to hike, hunt, and horse-back riding around the mountains. Also, animals don't know boundaries, so if the bears are moved, they might wander down into people's property and wreck havoc on the people. Also people aren't save because there are so many unnecessary gun hinderments. Lastly, the pets of the people wouldn't be safe.

This is just the tip of the iceberg. I could go on and on. But this is all for now.

Signed, a concerned [REDACTED]

Correspondence: Grizzly Relocation Not Favored in the N Cascades Nov. 7, 2023

The U S National Park Service and the U S Fish and Wildlife Service have AGAIN collected public comment on their proposed 3--option Plan, two parts of which would reintroduce Grizzly bears forcefully D)! catch and release into the Washington State North Cascades (NC). And ONCE AGAIN public comment is AGAINST any "recovery" effort! When will these agencies abandon this gravely flawed, publicly unwanted effort?

This proposed reintroduction interference in the natural progression of the N. C. bear population is not only unnecessary, it threatens the black and brown bear populations which would be killed and displaced by the stronger and more territorial grizzly. There is already a scarcity of food supply for native brown and black bear in the N. C. Seasonal berries are not that abundant, and fish stocks, highly prized by the native tribes, have been severely depleted.

The grizzly range is stated in hundreds of miles. It is simply wrong to assume that over the last 100 years the Canadian grizzly population has passed up the opportunity to settle in a suitable N. C. habitat. Were the "grass greener" on the U. S. side of the border, the grizzly would have migrated south into the N. Cascades. There has been NO human predation in the N. C. for over a hundred years...no human threat! No hunting. An estimated 691 grizzly bear live in Alberta, 65 of them in Banff National Park.

The existing black and brown bear perform the ecological need of "apex predators" (omnivores) through weak species management (killing weaker species), scat dissemination, and improving forest health. The smaller bear do that, essentially without the distinct threat to cattle, goats, sheep, and people (public safety) who enjoy the MC. backcountry.

Farmers and ranchers, already assaulted by Wolves, dread the presence of Grizzlies in their grazing pasturelands. This Plan for forced reintroduction encourages farmers, hikers, home owners and campers to "haze and annoy" bear that they come into contact with. That very interaction is incredibly risky for humans. Grizzlies attack and kill humans with non-specific provocation. People often carry food, and people are attacked as food. It could be your granola bar...or your butt...that is a meal for the taking. And, your nylon tent and bear spray are not adequate deterrents. Unless you own an Anatolian--bred dog, your family pet is Grizzly food. Grizzly are far more often going to stand their ground, and/or attack.

Grizzlies are far more likely to attack anything edible, including defenseless farm animals and humans. Humans are another form of "fast food" for grizzlies. Earlier this month a man and woman, both

experienced backcountry travelers, emptied a can of bear spray, and then were mauled to death by a Grizzly in Banff National Park. Montana officials euthanized a grizzly, likely stressed and hungry, who had broken into a home and fatally attacked a woman earlier in the summer. In 2018, a grizzly bear, which authorities described as starving, killed a woman and her baby in Yukon, Canada. In Yellowstone, 8 visitors have been killed, and hundreds have been attacked. Most recently, in Yellowstone, school teacher Amie Anderson was killed by a Grizzly on July 22, 2023, after which that Grizzly and her cub broke into a cabin searching for food (dog food). The act of breaking into a human home in the fall represents a starving bear and cub desperate to build up body fat prior to entering hyperphagia (hibernation).

Alaska averages four fatal bear attacks per year. Why would the residents of Washington State promote or allow this kind of unprovoked animal violence toward humans, which is usually fatal to the Grizzly bear (death by park officials)?

In the Rocky Mountains, grizzlies are increasingly moving into the valleys and prairies, wandering onto golf courses, breaking into homes, stalking chicken coops, and raiding cornfields. Montana and Wyoming are home to over 2100 grizzlies, with a population also in Idaho. Containing grizzlies will inevitably result in more powerful preventive measures. This NPS Plan for forced reintroduction will lead to taller and stronger fence lines, and other measures that will lead to travel restrictions of other wildlife populations. Out of necessity, the NPS will develop its own 'permitted areas' for recreationalists, preventing access into popular areas of the N.C.. Family dogs, often thought of as family protection, will be restricted to wilderness access even further. It has been found that bear spray (5'-10') does not prevent close-up encounters, and is an unreliable defense against a powerful and defensive Grizzly.

Preventative conflict approaches may then include human use restrictions on bear attractants, such as garbage, dumpsters, compost, bee hives, fruit and vegetable gardens, free-roaming chickens, and family pets. Some say "a fed bear is a dead bear." Secure storage of bird seed, pet food, and putting electric fences around school facilities, and playground guards are only deterrents to breaking-and-entering bears. Bears have Missoula, Montana hemmed in and are making forays around the edges, says Russel Talmo, a specialist in bear conflict resolution with Defenders of Wildlife.

Grizzly proponents hope that as the grizzly population expands, the areas between the five island ecosystems established by the Endangered Species Act will allow grizzlies to move between them. The N. C. is but one of the five large ecosystem areas. Much of this territory is crisscrossed with private property, roads, and is crowded with people, towns, cities, cattle, sheep, beehives, fruit and vegetable gardens, and...recreation. These human uses are inconsistent with a large, foraging, aggressive grizzly population... a bear population genetically opposed to turf sharing. After a human fatality, it is not uncommon for authorities to close those recreational areas to human use.

And NO, the tribes are not in support of this proposal. The Stillaguamish Tribe former chair told the agencies that the bear would diminish already--threatened Chinook salmon populations. The weak counter to the tribes that the CHOSEN grizzly bear would come-from berry-eating Glacier Park stock was PATHETIC--as if the Grizzlies would not recognize a fat--rich source of food and quickly learn how to fish!

The NPS and the USFWS are both proposing alternatives that include the forced capture and release of out-of-state Grizzlies--catch and release programs with "zoo-like" monitoring. Once begun, these programs will likely morph into feeding programs to sustain the starving transplants, and expensive and ongoing monitoring programs to keep the migrating Grizzlies away from domestic farm animals and local communities. 50, why another expensive, unnecessary, and unwanted 'zoo' monitoring experiment?

Currently, the Canadian Grizzlies could walk across the unmanned border into the Washington North Cascades...but they have not. Why? Because the grass is greener where they are! Leave the Grizzlies where they are successful.

This Grizzly program, if implemented, is guaranteed to result in MORE federal and State government intrusion into everyday lives. And, taxpayers will pay the extraordinary costs of this ill-conceived and unnecessary program.

Eliminate and remove the N. Cascades Ecosystem from the U. S. Fish and Wildlife Grizzly Recovery Zones!

During brief public comment periods (3), where only chosen a "lottery" can speak, and only for two minutes, does NOT represent adequate and open necessary public EIS review! It does represent a concerted effort by public agencies to attempt to muzzle true public opinion! The net effect of ignoring the public opinion will be the elimination of transplanted Grizzly bear by the hunting public. They will become the "game of choice" for the rural hunters. "HELL NO TO GRIZZLIES" must be heard by these supporting government agendas!

A steady stream of anti-grizzly sentiment has been once a in shown to National Park and US Fish and Wildlife Personnel. I personal will seek thro FOIA channels the results of this latest study, and I will attack every misrepresentation presented therein. Co-existence with transplanted grizzly bear in the North Cascades is out of the question!

Correspondence: RE: Comments on the Reintroduction of Grizzly Bears in the North Cascades

Dear Office of the Superintendent:

Grizzly bears should not be reintroduced into the North Cascades. We enjoy hiking in the back country and do not want to fear for our lives every time we go hiking. As land owners in Snohomish County Washington and Chelan County Washington, we are opposed to the reintroduction of grizzly bears into the North Cascades. The federal officials need to be reminded that Washington law forbids grizzlies from being introduced into the state.

The eco system is trying to survive with wolves and to add large carnivores i.e. grizzly bears that can roam 100 - 600 Square miles is not acceptable. Grizzly bears need to find enough food, water, shelter and space to survive. Grizzly bears will travel to find that space which means grizzly bears are mobile and migrate into new wilderness areas. What will happen to the wildlife that depend on summer berries and other vegetation to survive? When the grizzly bear can't sustain their diet on berries and vegetation, since grizzly bears are known to prey on large mammals, when available, such as moose, elk, white tailed deer, mule deer what will happen to those animals?

Grizzly bears have attacked and killed humans and can prey on livestock. The fact that grizzly bears have attacked and killed humans and can prey on livestock proves that grizzly bears are predators. Furthermore, having a tracking collar to monitor the grizzly bears won't prevent grizzly bears from attacking and killing humans.

Grizzly bears are carnivore predators and should not be reintroduced to the North Cascades. We need to protect our eco system including large animals, vegetation, fish and humans.

Correspondence: I am opposed to the introduction of Grizzly Bears into the North Cascades National Park ecosystem. I believe the region has a population of bears, both Grizzly and Black, that can handle the numbers as they are.

The Ursus arctos horribilis is a highly evolved apex predator, magnificent in its element. And, in my opinion, no longer has its element. The North American Continent has provided habitat for

all manner of creatures, of which the Grizzly stands alone, with no other controls other than other Grizzlies. The North American Continent was the land providing habitat and darkened skies of the largest swarm of the world's locusts, the Rocky Mountain Locust. The larvae and spent insects were an endless resource of highly nutritious food supply for the bears. The locusts are now extinct.

The artificial increase in Grizzly populations will have a profound effect on what resources remain, driving bears to fulfill their instinct of calorie intake into lands with homes and farmland occupied by legally and permitted uses of people getting on with their lives.

in my opinion, introducing increased Grizzly Bear numbers into North Cascade National Park ecosystem, with protection, will drive human activity away and eliminate ranching, farming on private lands as we know it.

Correspondence: Superintendent
North Cascades National Park

I am opposed to any Grizzly Bears being introduced into the North Cascades. There are already Grizzly Bears in this area. A male Grizzly Bear requires 600 square miles and a female requires at least 150 square miles. The North Cascade Park at 788.4 square miles will not support increased bear populations. They will not find enough to eat and will encroach into lower elevations, causing havoc on people and livestock.

I live and farm with cattle and 7 grandchildren in the Cascade region. I am not a hunter. Any Grizzly Bear on my farm will meet its demise.

I had a Grizzly Bear encounter in Alaska in 1971. I learned first hand that they are not Teddy Bears. *Ursus arctos horribilis* are very dangerous apex predators.

Correspondence: This letter is in response to an article in the Seattle Times on Sept 29 about Grizzly Bears in Washington State.

My name is Frank Harshfield. I live in assisted living at Village Concepts. 17010-140th S.E. Renton, WA 98058 #333.
the grizz@wavecable.com
360-387-1600

I am 81 years old. I have hunted in WA about 2 weeks a year since 1955 until 2020. I hunted mostly in Oranogan CO for deer and Yakama CO for elk.

Now lets get down to the facts. 2023 is not the same as 1955 when I saw my first bear in Maple Valley. The last time I hunted deer was near Newport WA. I hunted a good looking woods for deer and saw one deer in a week, but I could see all kinds of deer in town.

In the last 5 years, I have seen 5 bears, 3 in campgrounds and 2 on roads. The last one was a cinamine Black bear. I my life and my Dog were walking down the gravel road near the Rock Creek Campground. The dog saw it first and just stayed clam then I saw it we all stayed calm and just seemed we were all friends.

About the last 25 years, I have hunted the Toates Couilly Creek area where lots of rouge cattle summered into hunting season. The cows always run when I would see them but last few years, they look mean and I would stay away from them. Again, it is not 1955.

So I met the old farmer one day and asked him if his cows were meaner or if they I was just old. Yes, he said I was right, the wolves were biting the cows on the heels.

Also up Toates Couilly Creek an old man needs a light gun and I was carrying a 243 rifle when I walked into a nice field of red berries. After, I counted 17 Big piles of Grizz poop. I realized I was at bear lunch counter and got the heck out of there.

On a whole different subject, Take a drive over the North Cascades Highway. Stop at a trail head people everywhere.

Back to the Cinamine Bear. We were sleeping in our camping tent when the bear came to give us a message we were in his territory be ripping up a stump. We slept the rest of the night in the truck.

So now we get down to the facts. Spend a bunch of money to get some bears. You spend to get the bears out into the North Cascades. The bears move where ever with people following them at more expense. Someone gets killed by a bear, you get sued for millions the bear lovers and the bear haters and farmers get into it. Then there is the shoot and shovel folks get into. People go to jail. All because you cant admit this is a state that highly populated state that doesn't have any need for more bears and wolves.

POSITION STATEMENT:

o I support Alternative A "No Action" to the 3 choices given in the most recent draft EIS; current management would continue.

o I also support a 10j rule if grizzly bears naturally show up in the North Cascades Ecosystem (NCE) as stated in my 12/14/2022 comments. I recognize that we were not given this option this time around.

PAST SUBSTANTIVE COMMENTS

o Grizzly bears are dangerous animals; Grizzly bears have killed people in Wyoming and Montana, and most recently (10/2023) in Banff, Canada. The Stehekin valley no longer has access to daily seaplane service. There is no longer a road that goes to Cottonwood Camp. Why doesn't the draft EIS address the health and safety of residents in remote areas like the Stehekin valley?

o Transplanted grizzly bears often wander far from their release sites and end up in undesirable locations where they are incompatible with human activities. Grizzly bears go to where the food is. In the North Cascade Ecosystem, grizzly bears should be expected to be a problem in the valley bottoms, along salmon spawning waters and orchard areas where they will regularly frequent fruit orchards.

o There is a huge potential of pushing more black bears into the Stehekin valley. Why doesn't the draft EIS address this?

o Washington state's population is approaching 8 million, as of April 2023. Where is the detailed and in depth data showing the potential increased safety risk to hikers, campers and outfitters done by extrapolating data from the smaller populations of Montana and Wyoming?

NEW SUBSTANTIVE COMMENTS:

o The current draft EIS seems to be short on data driven analysis.

After attending the Wenatchee meeting of the North Cascades Ecosystem Fall Subcommittee meeting on October 10, 2023, and learning about the predictive modeling done by Sara Sells, US Geological Survey, Montana

Cooperative Wildlife Research Unit, Wildlife Biology Program, Ecology & Evolution Program, University of Montana, Cecily Costello, Montana Fish, Wildlife and Parks and others, I conclude that more peer review research should be done before transporting bears into the North Cascade Ecosystem. The predictive modeling shown in this twenty year study shows that the bears will also move to more populated areas. This study states that grizzly bears select habitat based on food availability to maximize fitness.

1. "Where is the data that proves that bears that would be transported around Glacier National Park or Northwestern Montana, 3 population chosen for their berry-based diets , won't learn how to fish or look for live salmon if the rivers (and I am thinking of the Stehekin river) IF they are hungry right before the hibernating season?

2. At the November 2021 public hearing in Darrington, members of the Stillaguamish and Sauk--Suiattle tribes voiced concern that grizzly bears in the North Cascades would diminish the already threatened salmon population. It took years for the Lake Chelan Sportsmen organization which my late father was part of, to create a sockeye fishery in Lake Chelan. Thinking long term, would this fishery become extinct because of the bears eating the spawning salmon in the Stehekin river and other tributaries?

CONCLUSION OF COMMENTS:

This is at least my 5th or 6th time commenting on this issue, some while in office; some after retiring from public service.

In all of the public comment periods over the years, I have never heard county commissioners support bringing grizzly bears into the North Cascade National Park. It doesn't make any sense to me why anyone would want to put the health and safety of their constituents at risk.

It is so frustrating that their repeated comments are ignored.

Correspondence: Restoring Grizzly Bears 10(j)

Dear Superintendent

Introductions of apex predators like of Grizzly Bears and Wolves in a human environment has been an issue to safety for communities and Forest users.

Currently, there is not enough suitable habitat for reintroduction Grizzly Bears can not be contained in an introduction sight. There is an expectation that Grizzly Bears will seek areas that provide more abundant foraging, entering areas near ranch lands, and forest communities near the introduction sites.

Communities and farmers are expected to defend their properties from Grizzlys that drift off site of the introduction site. The State and Federal Governments have not provided an equitable

remedy or financial restoration for Grizzly or Wolf damage. Many Forest users or recreationists avoid areas where Grizzly and Wolf have been introduced because of the possibility of conflict encounters and the reduction of huntable deer and elk in the area.

There have been no introduction success stories when there is expectation the human environment will be threatened by apex predators.

RE Grizzly restoration EIS

You are sooo wrong to introduce more grizzly bears to Wash State. Nuts is the correct statement.

A man just had his jaw ripped right out of his body. 7 people have been killed after using bear spray - most in the last 6 years.

The elk herds are nearly gone in the high mountains.

I Larry Jentz have been bluff charged within the last 24 months.

I have been part of a contributor to 170 near attacks stopped by pistols in ammoland.com. Author of pistols N bears in Larry Kanuits 467 page book Author in Ammoland.com expensive methods of testing ammunition penetration.

Have you looked at how many bear attacks are documented? How we might get 107 documented?

Over and over peoples lives are destroyed. It is not that rare.

Why introduce TRex. Seems wild. The bears are not cuddle bears. Sooner or later they are old near neat by another predator or even guided by hunger or natural instinct. A human must pay.

You wouldn't put rattle snakes in your house. Why put dangerous bears in the woods.

Right now, the locals say there are no- - few elk in the high mountains. I had to rise up.

Why go to the expense?

Look up and read about over 400 bear attacks.

You can study all you want. The agenda you give in the woods is dangerous to all forms of wildlife. Annual humans. Common sense. Common sense. Tragedy attack tragedy. Death after death. Horrible injuries lasting a lifetime a sure thing.

Do you want your husband, wife, child, son, daughter, to run into a grizzly???????

The human population in Wa State is expanding. Grizzly population in the lower 48 is between 1000 and 2000. Those bears are not always in parks or high mountains. There are many calls to reduce this population. Falling off on deaf ears.

Who will benefit from this.
Who will pay?

Note: CBS news Quote - 14% of grizzly attack victims are killed source???

I talked to Dean W- - - - today. Her hes studied and written more statistics of any person I knew. Grizzly bears are the most dangerous bears in the world. Quote.

Dear told me about the attack in Canada. I looked it up. A couple and their dogs were killed about- - - - - Friday, Sept 29, 2023. The cost to go in ?????

People in the mountains are told to carry bear spray. Butt when game dept. staff go to a trap there armed dept personnel have a shotgun and a .44 magnum pistol. Plus, they send in a drone to see if there are bears in the area. from Dean W- - - - -

Todd - - -, - - - - attack quickly - - - - a friend of mine now carries two pistols with him when elk hunting. .44 magnum - - - - and a 10MM. Bear spray too. A man with experience.

You can bet the average hiker from the city will not be this well prepared.

Call me if you want to contact F- - - - - author of 6 bear books.

Dean Weingater: Keeps track of all bear attacks. Been in contact with all know bear experts from Tow Smith to Stephen Heno. Many studies. Note they have redacted much of what they wrote. Goat studies.

Year another attack - Grizz heard about today

Correspondence: Thank you. Yeah, I live in Winthrop, Washington, and yeah, I just want to express my strong support for the recovery of grizzly bears in the North Cascades. It was something I was really excited about when we were at this stage seven years ago, and I'm glad to see it resurface, and yeah, I really want to support 10-J.

You know, I think that, you know, having grizzly bears back in this ecosystem not only ensures the ecosystem functions, that grizzly bears perform in such environments. You know, I think there's clearly also the value that grizzlies bring in terms of being an umbrella species and knowing that if we're conserving the land that's necessary for grizzly habitat, that there's so

many hosts of species that fall under that umbrella.

And so I think in terms of ecosystem health, restoring grizzly bears in an ecosystem just represents a much more holistic sense of health overall. Beyond the scientific aspects of those values, I just think the primary reason is the intrinsic value that grizzly bears have.

You know, I think that, you know, certainly there are the things that humans learn from grizzly bears and beyond just the spiritual dimension of having - - having them present in the landscape. They just have their own right to exist and, you know, I think having the benefit of living and working in Alaska for many years, I mean, I've done - - Yeah. I just - - I feel like there are very safe ways of cohabitating in the mountains, and I've done that with students, done that with fieldwork and field biology, and yeah, I think the one last thing that I would really encourage is, you know, really, really focusing on the connectivity between the North Cascades as a core area with other areas for bears to emigrate and immigrate from, so it's not so reliant just on the introductory efforts.

Correspondence: My name's Kevin, and I live in Mazama. I own two recreation businesses in - - in this area, so - - and I've been here for 30 years, so I have a strong pulse, I think, of what goes on. And I've seen the area grow and grow and grow with more recreation users. And although I'm completely supportive of recreation, I think that the rec users have started to overstep their boundaries and how they use the land and expect that the land is just there for them.

And I am supportive of grizzly bears, and I feel that there with the 10-J rule, we can put stipulations in so that the ranchers can be compensated. We'll have collars on the bears. We can use the technology that we have so that rec users who want to hike with no bells and - - and want to be safe and go run solo at night, they can, because they could get an app, and they could find out if there's a bear at that particular pass.

The ranchers can say, yeah, my cattle were killed by cows, and we can see that it was, and we can compensate them quickly, and there should be no drama there. So I feel that there's lots of ways that we can incorporate these bears, and I feel that it's time that the humans don't think that they're always the apex, and that they can start to understand that they may have to adjust how they are using the land.

And right now, they are just - - with all the apps and all the electronics, they're just overrunning the land at will.

Correspondence: My name is Wayne Stevie, and I'd like to discuss this grizzly bear issue. Anyhow, I want to know what type of habitat. I've been all through these mountains. I've lived here my whole life. I've known people that were here in the 1800s. They're gone now. There was no grizzly bears in these mountains to speak of. There were no mule deer here in the early 1900s.

I want to know what these big bears are going to eat. They take X amount of protein to survive. They're not going to live off of a few plants and berries. What are they going to eat, a few skinny black bears that live there? There is no food source for these bears.

And if we get bears, what are they going to get, the troubled bears from Yellowstone? It's - - to me, it's ridiculous that they even think of having them here. It's not fair to us, and it's not fair to the bear.

Correspondence: I'm in favor of option A because the grizzly bears are currently reintroducing themselves into the Olympic National - - the Okanogan National Forest. My career was doing GIS here on the Okanogan, and 2015 was the first verifiable identification of grizzly bears on our forest by a wildlife biologist.

They were coming in from Manning Park. And if they want to reintroduce naturally, that's fine. But to reintroduce them artificially in the habitat, it is questionable at best because of our fire management practices of letting things burn in the park and the habitat changes so rapidly. I am not in favor of that.

I know that the - - from having relatives in the Kenmore area where grizzly bears are - - are - - I don't - -there's a large number of grizzly bears in that area. The community has had to take action to prevent the human bear interface by requiring all - -By requiring all the residents to have bearproof garbage cans, if you're camping in that area, most of the campgrounds are electrified to eliminate the grizzly human contact. And eventually if we've introduced grizzly bears in not naturally where they're wondering around and not - - not the correct habitat, they will be coming down into the valley floor and having more interaction with the human population.

And the loss of one human life to a species that is introduced not naturally is not acceptable to me. I think that's it. Thank you so much.

Correspondence: Good Evening, everybody. I'm [REDACTED] Does this feel like DVU all over again? I'm here to support option A and I'm extremely opposed to option C, which is the location introduction. You called it the nonessential experimental population of grizzly bear to the North Cascades. Don and Brad, we're very grateful to have this opportunity. We absolutely are. But it seems to me in my humble opinion that with the concurrent introduction of the environmental impact statement along with the 10(j) proposal, that tells me that this is on a fast track and that in my humble opinion you've already made up your minds as to the plan to bring grizzlies into our communities. I also take tremendous exception to your desire to not listen to or ignore those things that you say are non-substantive comments. Anybody in this room or anybody in North Central Washington that says they either do or do not support the introduction of grizzlies is not being considered a substantive comment, and to me that silences a good number of people in our communities. We don't all have science degrees and then the ability to tell you whether or not ecosystems are - - are - - are perfect or not perfect, but we do know what we want threatening our communities, whether we want an apex predator in our backyards. Those are the kind of things that we can definitively say yes or no to. So I think that is a very concerning position for you to take. As a farmer myself, I'm worried when I'm on the farm about my own safety. I worry about my family's safety. I worry about my employees' safety. Plus, a crop devastation, a livestock predation that we all know is going to occur. Even though all of these things are apparent to us and I think apparent to you as well that these bears will move out of the zone from where you propose putting them, it seems to go contrary to common sense that we continue down this path. My two minutes are up. Just two more things I want to say. What's very concerning is the - - the position you've been taking that we have to move before Canada brings bears down south and they might move into our area. When me and my staff have talked to the Canadian Fish and Wildlife Agency, there is no pending plan. There's discussion but no imminent plan to move bears into Southern DC. So in order to move and utilize that pending action, I think that is disingenuous to be using that as an excuse. So I have three - - three questions. What's the Agency's plan for dealing with crop loss and livestock depredation, which I think is inevitable? What is the timeline for issuing lethal permits? And how much will citizens have to lose before they can defend themselves from a predator in their backyard? And what is even more concerning, when will you listen - - I know you're going to hear - - but when will you listen to the majority of the people who will have to be directly impacted by - - by your decisions? They've made it clear time and time again, they do not want these bears here, and that was loud and clear four years ago, and I think that message is loud and clear today. So, please, listen to the people of Northern Central Washington. Thank you.

Correspondence: That's okay. So just to have it for the record, I'm State Senator Shelly Short for the 7th District. All of Okanogan County is located in the 7th District. It does feel like dvu. I'm not going to repeat Congressman Newhouse's comments because they are right on and I support what he said. What I really want to talk about is if this ever was really serious about dealing with impacts to local residents, to agriculture, to orchards, to safety, to outfitting and guiding all of that, you would have put it in the document. The only one that recognizes that is option A, which is the do nothing. We have been here several times before. We were here back in 2019, and I know that you're all working on this, but it's offensive. It's offensive not to take the comments of the local citizens seriously. Those bears are not going to stay there. We know that. And we know that where they're going to end up is in fields and farms and orchards, and just having dealt with wolverine introduction in the 7th District, in Okanogan County we have great people working together but the impacts have been huge. And in an area here where they're listed as endangered and you cannot take that kind of action, we're really looking at the same kind of thing. You know, you need to - - you need to be - - so my comments will be if you are doing this, which I hope you are not, and I advocate for not, then you need to look and you need to talk to folks and you need to get an understanding of the kind of impacts to their local operations and what this is going to do to them. Because without that, without that you do not care about the local communities and the impact if this is happening. So, again, I'm State Senator Shelly Short, and I support option A. Thank you.

Correspondence: Good evening, everyone. My name's [REDACTED] (phonetic.) I live here in Twisp, Washington. When they asked me would I like a number when I came in, I'm like, sure, I'll take a number in case I - - I want to say something, and of course my number's the first one that comes up. Okay. Oh, my gosh. I'll keep it brief. I don't need two minutes. First of all, I got a master's degree in ecology and spent the bulk of my career working as an - - as an ecologist, and even participated in writing a few EAs, which is like a mini EIS.

And my hat's off to these people who dedicated their lives to carrying out the laws governing this aspect of our life and also just preserving and protecting the wildlife that we all value because it's because of them that we still have it versus - - I mean, that's what actually spawned the Fish and Wildlife Service and wildlife management in North America was because wildlife was being so decimated because it wasn't being managed properly. So anyway, my hats off to - - to those folks who dedicate their life to it.

I was just looking up - - I'm a - - as a scientist, I'm a data person. And so I was just looking up, and I quickly pulled up a survey from the University of Montana. Let me preface this by saying change is horrible. I'm a teacher. Any time I change the rules in my classroom, it's always met with protest and upset and - - and so - - but as I explain the reasons why we're doing it and why - - okay, yes. Okay. Anyway, let me get to the point.

University of Montana survey, an overwhelming majority of Montanans, 92 percent agree or strongly agree that grizzlies have a right to exist in the state, and nearly three out of five Montanans, 57 percent, disagree or strongly disagree that grizzlies will limit their recreational opportunities.

My point is that those folks in Montana are more like us than folks in DC, and they live peacefully with grizzly bears. Thank you very much. Thank you for being here.

Correspondence: [REDACTED]

My name is [REDACTED]. My given

name is (speaking native language), which means grizzly bear, and the bear is definitely a big part of all our culture here in the Indian country, as all the animals are. But as time has moved on, and as a lot of you know, things have changed, and a lot of things have affected our culture in a way.

Some of the things that we face right now is a lot of the (indiscernible) listings that's affecting our (indiscernible) that affects our opportunity to gather food, federal law that changes our access to get to traditional areas of food. So it causes a lot of conflict amongst our own membership and amongst our own tribes on how we deal with these issues.

And we really appreciate everybody coming out here tonight for this very controversial issue. And we wanted to welcome you on behalf of Stillaguamish and Sauk-Suiattle into our traditional homelands here. Our relatives and us share this area up and down the Snohomish River, and we have Draft EIS Meeting 1 November 2, 2023 NDT Assgn # 69368 Page 3 since time immemorial.

And we face declining salmon, and we have to fight with the seals. We have to fight with the killer whale. The federal government, they come in and try to fix it when they've got other problems that they've got to fix, fix our salmon. And it's really tough to go back to our people and - - and tell them that our tribe is opposing bringing bears in. It's pushing back on our culture. And it's a tough - - tough discussions we had back home.

And some of the things that the state, the feds, and the counties need to realize, just trying to protect our salmon, our way of life. We're fighting with landowners; we're fighting with farmers. We've got elk that sustain our life as well and we've got landowners that don't want the elk around.

We're always put in the middle of fighting with our neighbors, and that's not what we want to do, do we? We don't want to fight with you. We need to sustain our culture; we need to sustain our way of life. So we understand the emotion that a lot of you are feeling and - - and we understand that.

But it's like the wolves, we just don't have the territory for it. Times have changed. We're not surviving off the wolf and the bear. All through the process, we told the state and feds as soon as we get the wolves inside our Draft EIS Meeting 1 November 2, 2023 NDT Assgn # 69368 Page 4 territory, we're writing tags. We can - - our elk, our deer. The same thing we did with black bear. The black bears will be eating cows and fawns of deer.

So I also want to thank the feds and the state for putting on this public meeting. I know because you guys are definitely taking heat for it sometimes. But I just wanted to say thank you for giving this opportunity for us to welcome folks on behalf of the Snohomish and me to say a few words. I'll hold my public - - public comment, but we do ask

that we have government to government with the feds as soon as possible.

Before any moving of bears should happen, we should have all the tribes on board. And that's not dismissing the public. Please don't get me wrong. But they have a government-to-government responsibility with us. And to move forward without the bears without all the tribes on board, I think it's a big mistake.

So anyway, thank you.

Correspondence: [REDACTED]

Thanks, everybody, for coming out here. Friends, neighbors, we adamantly oppose this, so we -
- I assume you're here in support of that. The state, I know, is just following orders. And park service, I'm going to - -

[REDACTED]
I am [REDACTED] Sauk-Suiattle tribal council member.

UNIDENTIFIED SPEAKER:

Okay.

[REDACTED]
So welcome to our homelands. This is our home. And this is the third time we're battling this, a predator being introduced into our homelands. And we don't have the salmon populations to support. Originally it was 400 animals, and then they reduced it the second time around to 200 animals. Now it's two to three a year for the next 100 years. We're just as opposed to that. Like Shawn said, we're going to cut tags for them. And I've said this in the past, we're going to hunt them, we're going to kill them, they're going to go. That's how opposed we are to them. I'm sure there's some rules they can get me on that I can't do that, that's illegal. But the big thing with this bear is not only does it put our salmon at a threat and risk, I was a tour guide in Alaska. I - - I brought people to watch the grizzlies kill salmon in Haines, Alaska. And they kill just, you know, indiscriminately, just for the fun of it, especially the two-year-olds. They just love killing. They're having fun.

We don't have those runs to sustain that in Washington and it will be devastating for the salmon runs if they're allowed to get into them. They say well they eat

plants and they're from the highland and they don't know what salmon are, but they can sure smell them once they get into our spawning grounds. I've had a talk with the state previously. That's our red line in the sand.

When they get to the spawning grounds that's it, they've got to go because they're not going to leave until they go to hibernate. And here sometimes the winters are so mild they don't hibernate. Well, they might for a few weeks or something. So they're going to be feasting as long as there is food to eat. When the salmon run out, then what? Well, deer and elk.

And we have horses, we have pigs, we have chickens. I'm not going to allow them to get in after our animals. If that happens, they die. There is no calling the state, can you shoot this - - this bear - - that bear out of here. They're the kind of animal that you don't want to And when I see the tribe folks trying to introduce this species, these people don't give two cents about any of your human lives. Okay? Because I've told them already, you're going to get people killed in the North Cascades backpacking. Well, that's just nature, was the answer I got

back. And I disagree.

We hike in the North Cascades with our children and - - and elderly. They have no defense against an animal, a mama with cubs. You know, there's - - there's - - there's no defense for it. So I'm glad you're here for support. And we're going to fight this thing one more time. And I hope this is the last time because this is the third time around. So thank you.

Correspondence: Well, thank you. I - - I'm like you. I - - they asked me. I go, I don't know my number. I'm number two. So first of all, if I go past red, is Sherriff Budreaux (phonetic) going to tackle me and, you know, pull me out of here?

So we just went through this a few years ago, and we said, no, we didn't - - we didn't want the grizzlies. I'm a local. I live in Methow Valley. So why are we going through this again? Is the government really listening to us? It seems like they aren't. So why should we trust you, you know? We're going through this again.

Number two, I'm a Lewis and Clark buff, and why Lewis and Clark? Well, they lived back in the grizzlies, and when you read about what they did with the grizzlies, they'd send out five to six soldiers when they were taking on the grizzlies, so it's - - it's pretty dangerous. The Native Americans talked to them about the grizzlies. They send out seven to eight men, and were expecting to lose one or two of them when they went up against the grizzlies. These are people that lived with the grizzlies. Horseback riding and hikers. I spent - - I see a couple of hands here. I spent about ten years with a buddy of mine, up in the hills, up in the mountains, going out in the middle of nowhere. And what you have to realize is - -30 seconds - - there's no cell phone coverage up there. If something happens, it could be dangerous. It could be, you know, hours, days to get you out of there.

The option is to defend ourselves. We had that with the wolves. We were promised that with the wolves, but we got - - what we got was a bunch of lawsuits, so I'm not sure that's going to happen. And the liability is - - if we do lose a loved one, who's

liable? Is the government going to be liable? Is the state going to be liable, the feds? You know, who's going to be liable and, you know, and there's my red sign.

Correspondence: Well, I'm a Methow Valley boy here. I'm about fourth generation. I've backpacked in these old mountains, led backstreams and put many hunters back in the sawtooth and the (inaudible) and I've yet to hear of any hunter that's seen a grizzly. Back in '62, my dad saw one as he was coming down through the state airport here, and there was one across the airport there. The same year Tom Graves saw one in '62, probably the same one. The grizzly bear, the habitat is not back there for the grizzly bear to stay there. If it was, they would be there. I haven't heard of anybody killing grizzly bears up there, so if there was habitat for them, which is a key issue in this right here, now. If they start putting grizzly bears in the area, where are they going to go for food? It takes X amount of protein for that grizzly bear just to get ready to hibernate. And then when they come out of hibernation, they're hungry, and there's no berries out there by the end of the spring. So where are they going to go? Where are they going to go for food? They're going to come down, and they're going to be eating on the - - whoever they - - whatever they come up against here. So I'm opposed to grizzly bears being in the area. I'm for - - our first option is no grizzly bear. So - - my time's about up? Thirty seconds, okay. Well, let me see here. I - - I don't want to waste your 30 seconds here. Well, like I say, it's - - it's - - I think it's a shame that we keep going through this and through this process here and trying to get grizzly bears put into a place where they're not going to stay, so - -

Correspondence: I'm [REDACTED] (phonetic.) I live over in Loomis. It seems like a long ways to come for a grizzly bear meeting, but I actually run cows about 15 miles from here in the summer, so it's very important to me that not only I keep my family and I safe, but I also keep my livestock safe. And once grizzly bears add into the ecosystem, it's not going to be a safe situation for my family, my crew, or my livestock. There's - - when grizzly bears were extirpated or however they want to say it back on their fancy signs back there, that was back in, you know, the early 1900s. There was a very less - - less population in this area than what there is now. And so by introducing grizzly bears into this area now, I don't see how we can avoid human conflict when they had human conflict then. That's why they got rid of them. They didn't just think they were cute and cuddly, want to take one home. They got rid of them because they couldn't live with them. And so we're just setting ourselves up for a disaster, and like was mentioned before, there is not enough wildlife in the higher elevations of this area to support a grizzly bear population, so grizzly bears will be in the valleys. That's where the food is. I'm a (inaudible) deer hunter. In the last ten years the mule deer population is basically half or less than what it was ten years ago. So what are they going to eat? Not nuts and berries. They're going to come down to the valleys and - - and eat the deer that are down there and the livestock. So - - and the 10-J threat, we had that same promise with wolves. Just because something is in their toolbox does not mean they have to use it. It's still up to a bureaucrat whether or not they're going to use what's in a toolbox. And with wolves, they chose not to use it, and we know how that ended up. So that's - - that's my thoughts.

Correspondence: 115 SPEAKER:

I'm 115, and my concern is that I sometimes go hiking. I don't want to come upon a bear. I don't want to come upon a wolf. I just want to be in a peaceful place. And I feel like if you add these bears, you're going to take away from the people. You're going to take away from people who have cattle because when a bear gets hungry, it's going to get to eating. And we do have salmon. We didn't even talk about our salmon, but bear like to eat salmon. The rivers here have salmon. Are we going to protect that? What are we going to do when a little kid gets attacked by a bear? I just want to know how we can protect ourselves. And I'm done.

Correspondence: I'm 142. I guess I was jumping the gun a little. I'm for the no bear option, and I'm for no wolf option. That didn't work well either. And I - - I don't think the bears affect everyone, but eventually I think it's going to affect everyone that eats food because they're going to mess with our farmers and ranchers that are making their food for you. So eventually it'll come down to that.

And some people want grizzly bears, and I want those people to have bears, as long as I don't have the bears. So I think I have a solution. If whoever wants bears will just build a great, big, tall, tough fence around their property and bring in a dozen of them, and have them for your pets, man, I think it'd be great. And your neighbors will like it so much, they'll want some, and you can help them build a fence. You can sell them bears. It'll be great.

But seriously, this is going to affect everyone. It's even going to affect these game department people, when they can't eat either because we've brought in all these predators. We're screwing with our ranchers and our farmers, and we can't do that. So that - - that's my opinion. I raise cattle, and I - - I don't want any bears.

We have enough black bears. We have enough predators already that are messing with us all the time. Orchard - - the bears screw with our orchards, and they mess with our cattle. It's just all a downside. I - - I can't find the good part of a grizzly bear, but that's my opinion. Like he said, change is hard. It's going to be really hard if we have to change to no food, so thanks.

Correspondence: [REDACTED]:

I'm number 130. Hi, folks, my name is Jack. I first want to thank the agencies for their resilience and - - and pursuing this process. They are here doing the work that they are required of them by the laws of the land, the Endangered Species Act. In this case, to recover the grizzly bears in North Cascade's ecosystem. So I thank them for that.

In my mind, the biggest issue here is - - is coming to terms with human and grizzly coexistence. There's no doubt that conflict can and will occur, whether it's safety for humans, livestock, hobby farms, recreationalists, whatever. It's clear from data from other places, however, that where - - that where grizzlies and humans coexist, most notably in Yellowstone and the northern Rocky Mountains, Glacier National Park area, over 1,000 bears in each of those ecosystems, that humans and grizzlies can coexist.

Draft EIS Meeting 1 November 2, 2023 NDT Assgn # 69368 Page 20
There's ample conflict avoidance information out there and there are agencies and nonprofit groups that can work with folks to minimize those conflicts. There's only one reason that grizzly bear populations continue to rise in those ecosystems back to the east, because humans and grizzlies are coexisting together. I have lived, worked and recreated in grizzly country since I was a teenager and I continue to do that to this day.

Again, should be no expectation by anyone that you can have a risk-free environment, especially in a mountainous wilderness landscape like the North Cascades. But the risks associated with grizzly bears can be significantly diminished. There's a saying that I - - I like to refer to. It goes like this, wilderness without wildlife is just scenery. The North Cascades ecosystem is missing grizzly bears. In my opinion, it's a diminished the ecosystem and I fully support restoring grizzly bears to the North Cascades. Thank you.

Correspondence: [REDACTED]
(phonetic): Hello, my number is 131.

My name is [REDACTED] (phonetic). I just moved out here last year, started hunting three years ago. I'm totally opposed to bringing in grizzly bears. There's a lot of issues I see with it. I don't see we have the proper acreage out here. There's too many people. We have too many folks from like Seattle and everything, people who aren't used to being out in the woods coming up into our area.

And I see a lot of conflict happening and people dying. I don't want us to be like Montana where we have issues and people are dying pretty frequently by grizzly bears. And I'm sorry to say it, but our commissioner isn't helping us with predator management at all. We're having hard times with black bears and cougars. We're having a lot of conflicts, and just adding another predator is just going to be more detrimental to our ungulates by a long shot.

And we're not maintaining our predators right now very well either. I think there needs to be a lot of things addressed before we try bringing in grizzlies. And that's all I have to say.

Correspondence: My name is [REDACTED]. I'm a (inaudible) and secretary of the local county cattlemen's association, and how many times we've used the word dvu tonight, but not only is this dvu as a grizzly bear meeting and us making known our sentiments, this whole (j) proposed rule is also something that has been used in our communities before to bring in wolves. Why are we trying to introduce an additional apex predator into a state that cannot handle the apex predators that it has? Our (inaudible) populations have already been impacted, not just ranchers' livestock, and it might be colloquialisms, but there is no official ongoing data that I'm aware of, but those of us that live on the land have not seen the moose paths and have not seen the deer that we used to see, and you can't tell whether that is because we don't have any large wolf population. In the proposed areas that they would like to put in those grizzly bears, what about the wildlife that already exists there that are vulnerable? I have heard comments before the wolverine population is a concern. Why are we not focusing on species that are already there that need assistance versus bringing in a large predator that will take up limited resources that are already in that vicinity? All of the producers that I have spoken with in areas that have both wolves and grizzly bears tell me tenfold they will take the wolves over the damn bears. They are an easier thing to manage. I can't afford to put a Jurassic Park type fence around my livestock to keep out a large predator like a grizzly bear. So I would urge that the agencies involved take heed in what we have to say. Please, no action. We'll take the ones that come. Don't damn bring 'em in a trailer. Thank you for this opportunity to speak, and we hope that you would go with option A, no action.

Correspondence: My name is [REDACTED]. I'm the president of Okanogan County Farm Bureau. What our entire membership is proposing is no action under alternative A. I have a whole list of things that I was supposed to say here. I know that it's going to come out. We live with these predators every day. I live up in the (inaudible) area. We've been privileged just like the rest of our entire county with major fires due to mismanagement of public lands by public agencies. I have had the entire fringing mountain come down on me multiple times, and I am trying to raise young kids on my own with a husband who is a paraplegic. Agriculture is under attack. You guys are worried about food security, and yet, public agencies are doing it themselves. We are (inaudible) the security. Secretary of the Interior Bernhardt terminated the introduction of grizzly bears at our last meeting. Why is our presidential administration overturning that, and I'd like to know what authority they have, our president, to ignore us. We do not want these bears. You guys do not have the right to dump it upon us and our children. I'm going to let it go at that because I'm going to get pretty emotional and I get pretty ticked at that point, and that's not fair to my membership. We do not want any action on grizzly bears. Thank you.

Correspondence: I would urge no to grizzlies in the North Cascades. Concern is the dangers to employees and friends and residents alike. And what is the caring capacity to determine on food that those bears will have and once they're done with that, they'll be into domestic animals, and those are our livelihoods. We - - we don't get paid to have hurting things out there. We get paid to do our job. The migratory herd I see is an issue. The most deer that come out of the North Cascades, they come into the lowlands. Those bears are going to be hungry. They're either going to - - either coming when they come down in the fall and when they come out in the spring and those fawns are young and they're easy to prey on. And have we ever had an experimental population under the (j) plan (inaudible) bear and be eliminated or do we just build from there? Thank you.

Correspondence: Well, I'll let you restart the clock or I'll take his seconds. I'm [REDACTED]. I grew up here. I have a century of family farming and ranching in the area. But I do want to take a note and kind of respond to the beginning here. I don't think the most important people in the room are the ones taking the notes. I think it's the people who constantly suffer from federal policies from people back in D.C. while we scrape together a living when they're constantly making policies that affect every one of us. So that's first of all on the first issue. Second of all, when we have good policies that help us, that help us in farming and ranching and do the things that we need to do, it seems like it takes years to get passed. We suffer as we wait for our politicians - - by the way, I'm a new politician so I can say this, I guess - - to finally get the job done and agree for those us back here to help us. And yet, when there's policies that affect us greatly that burden our agriculture and our ranching way of life and our culture, they seem to be pushed through pretty quickly, and they use key words and (j) s and A, B, C, and D, and we get to pick one, as we suffer as they make decisions back in D.C. and Olympia. I am absolutely opposed. I would like to have another generation of my family on our ranch. I would like my children to continue to enjoy our community and be able to go outside safely. By the way, the states that do have grizzlies have alert systems to protect their children. They have training. They know that their children would suffer if they go out into the mountains. And, once again, we'll be making policies with predators without those safeties hoping that maybe when our cattle and our animals are killed, maybe even our families, that they will respond, give us little trinkets of money to keep us going over here as we continue to try to survive. I am Jacquelin Maycumber and I am absolutely opposed to this policy to continue to be brought down by the people who are not living here and trying to continue in our way of life. Thank you.

Correspondence: Hi, my name is [REDACTED]. I'm sorry that we're back here. I'd like to just kind of follow up on that last statement. Is there anyone here out in the audience in favor of bringing or introducing grizzly bear, raise your hand. One, two, three, four, five, six. All opposed? Gentlemen. I realize these two gentlemen here are under a lot of pressure from other interest groups and particular environmental groups like the Sierra Club to reintroduce grizzly bear. I see the Sierra Club is based in the great state of California and their national flag or their state flag is a grizzly bear. Let's start with California reintroducing grizzly bears down there. I think it's a little (inaudible). I think differently than most people. I think liability. I think legally. Everyone here that walks about in the room has a duty, a common law duty not to commit negligence or intentional torts by criminal actions. If I drive drunk and hit somebody and kill 'em, I can expect this man here, this sheriff, to arrest me for vehicular homicide, and goddamn, I would deserve it. Now, it is foreseeable if you reintroduce grizzly bear that sooner or later they will come in conflict. It is a proximate causation from that, and people will die and be maimed. And, gentlemen, I have seen a young woman who ran across a grizzly bear in the wrong place at the wrong time in Montana, and she's still undergoing plastic surgery, but I digress. It is not a matter of whether people will die or be maimed but when and how many, and that's why you are here today, because you know you could be one of those people that walks around the trail and runs right up against a momma grizzly bear and her cub, and when you do, I submit you will lose every time. When these

gentlemen are out in the woods collaring grizzly bears, they're comfortable around them, but let me tell you, there are armed to the teeth. They will carry magnums. They will carry sawed-off shotguns with a solid shot because they should, because grizzly bears are a dangerous animal. NICOLE SHERBERT: Thank you, sir. NORMAN STANSFIELD: So my time is up. I thank you for your time here. But I will tell you confidently, if these gentlemen stick their necks out and put up a bond or make themselves civilly and criminally liable for what happens to those people that are killed and maimed, I'd be more than willing - - I'd be more than willing to revise my opinion on that, but right now they have no responsibility at all.

Correspondence: Good evening. I am [REDACTED]. I'm a member of the Okanagan County Farm Bureau. I also work with ranchers and farmers on some of these issues that we are facing with environmental things that actually inhibit the ability of ranchers and farmers to do their job for us. I also live in Methow and am equated with how agriculture has disappeared from Methow for various reasons. So we're already in a declining position in reference to our agricultural community. One of the things that I noticed reading the EIS is that the scope of work has been violated because this EIS covers the fact and informs us that we now have three zones where the grizzly bears will migrate into rather than the North Cascades Ecosystem. So what this means is that was not covered in the scope of work and the people who are in the other two zones have no opportunity to comment on the trajectory of this EIS, and therefore, I call it an invalid process. The other thing that's important to understand is that the original designation of the North Cascades Ecosystem was the only designation made out of six for the state of Washington, not other zones. So that is the designated recovery zone. It even states this in the grizzly bear annual report and that the introduction of bears into the North Cascade would be based upon their ability to support a sustainable population over the other challenges which they may face being in the North Cascades Ecosystem. So three zones is for your information include the territory from south of I- , back and by and the I- corridor down through the Columbia River. So I'd like to enforce the fact that this is - - my position is alternative , no action.

Correspondence: My name is [REDACTED]. I live in Wenatchee. Unlike Montana where grizzlies were never completely exterminated, most of us here have never seen a grizzly in the North Cascades. It's unlikely that our fathers or even our grandfathers saw a grizzly in the North Cascades because they disappeared long ago. By the early s, the number of grizzlies in the North Cascades was very low. The grizzlies disappeared because we shot them, we trapped them, we poisoned them. Throughout the West, we tried to exterminate grizzly bears, black bears, wolves, coyotes, even hawks and eagles. We thought that was the right thing to do, maybe even the heroic thing to do. Old man Cool (phonetic) lived at Domke Lake near the head of Lake Chelan from to . He was a trapper, hunter, and fishing guy. Old man Cool killed bears. I do not know how many grizzlies and how many black bears, but certainly some of both. He was disappointed that he didn't reach his goal of killing bears. That is why at least in part that there are no grizzlies in the North Cascades today. We wiped 'em out before we really even knew much about them, before we even understood the concept of ecosystems and the balance of nature, predators and prey. We know better now. We know that grizzlies - - where grizzlies prosper, so do all of the other native species in a region. We have an opportunity to correct mistakes that we made in the past. There are not many places we can do that. The North Cascades is one of six places in the United States that's big enough and wild enough to support a viable population of grizzly bears. I think that we have a tremendous opportunity here to restore the species, and I am supporting this alternative . I hope we can get this done. Thank you.

Correspondence: Good evening, everybody. My name is [REDACTED]. I'm from Winthrop. I live there with my wife, Kit McLean Cramer. Our family goes back five generations in Methow Valley. I'm a retired soldier. My wife is a horsewoman who raises a herd of about horses every year for the kids' camps all in the Pacific Northwest. We have children and we have grandchildren. Option A. Do not introduce grizzly bears to the North Cascade mountains. I don't hate grizzly bears, I love them, but they thrive where they are and I presume they're happy there. We thrive where we are, and I guarantee we're happy here. But an introduction of an apex predator into a recreation area which is heavily used by hikers, bikers, campers, outfitters, hunters, and visitors from all over the world on the Pacific Crest Trail would lead to death and maiming. People will die and we know it. So don't pretend it's not going to happen. Of all the rest of us all this evening, bear attacks have surfaced over the last six months here in the American west. One of my good friends in Winthrop lost both her parents when she was a young child to grizzly bear attacks. Not only will there be attacks and not only will there be injury, but a whole way of life will suffer. Outfitters will lose permits. Trails and camping areas will be shut down at certain times of the year not to adversely affect the grizzlies, so keep them where they're happy. They love the Selkirks. They love Yellowstone. They love Montana. Not in Methow Valley and Okanagan County. Thank you very much.

Correspondence: Hi, my name is [REDACTED]. I am the Professor of Natural Resources at Wenatchee Valley College, and I have years of experience as a natural resource manager at Timber Fish and Wildlife. I vote for option A, to not introduce grizzlies, but I have an alternative. It pains me to see the North Cascades Ecosystem in the state that it's in. It's decadent. It's dying. Why do we put out the fire? I was in Yellowstone in the eighties. It's forever wild. Let it burn. Fire is part of the ecosystem. I do not believe that the habitat in North Cascades can support a viable population of bears, grizzlies, but someone mentioned we have wolverines. I've seen wolverines on Highway . Take your good intelligence - - I know everyone, I've worked for the federal government. My last gig was the Bureau of Reclamation. There's intelligent people there. Take an effort to manage that. If you really want to introduce something to this area, introduce a sawmill into Okanagan County and start harvesting dying decadent timber. As a private citizen and owner of that resource, it pains me to the point that I puke that I see that resource burn. And since we have no more extraction of resources because the Forest Service has no foresters, we have to pay excess taxes because their PILT payment, payment in lieu of taxes, is almost nonexistent. We have to just vote to pass O&M increased levies every year because that resource from extracted resources is earmarked from public roads and education and we suffer because the management is not there. So if you want an alternative A, you can introduce a sawmill into Okanagan County. I will - - I will literally work for free to set up timber sales for the good people here to get back on their feet and have a higher standard of living that was once here in the seventies. My time is up.

Correspondence: 114 SPEAKER:
I'm number 114, and I moved here 22
years ago, and I went hunting one time here. You never see
no deer in this state. I take my grandson shooting from
Arlington to Darrington every weekend, spring to fall.

You're lucky to see three or four deer. In New York State, I hunt back there every year for a month. Their average kill is 220,000 deer a year. Washington state is bigger, 26,000 deer a year.

Pennsylvania is bigger - - smaller than New York State. Their kill is 330,000 deer a year. You got way too

many predators here. New York - - back in New York and Pennsylvania, they don't have coyotes - - or they don't have cougars, they don't have wolves, which are the main killers that kill one deer a week for every animal - - wolf or You can't go hunting here and be successful. You probably have one percent success rate hunting in this state. I'm totally against any kind of predator out there whatsoever. They did a study on coyotes, coyotes will kill 26 deer fawns per year to feed the puppies. They put trail cameras on the dens in - - I think it was Nevada. One pair of coyotes killed 46 deer fawns out of the system. And that's a small predator.

Bobcats are killing the deer fawns, black bears kill deer fawns. There's no room to have hunting and predators in any state. Get rid of them. Don't - - don't install more predators to kill our game and fish. Once they get a taste of something, they're going to be there every day until that source is gone. I'm totally against any predators. I'll - - I'll let someone else speak.

UNIDENTIFIED SPEAKER:

No. I'll let somebody else speak, but I'm totally against predators here, any kind.

Correspondence: [REDACTED]:

Okay. My name is [REDACTED]. I need

to apologize to everybody here who came thinking you were going to get your questions answered in a forum where you ask the questions and the panel will answer them. That was the impression I got. That's what I sent out to all of you people, and it's not going to be that way, so I apologize for that.

And I want to just - - three or four years ago, the Skagit County commissioners had a meeting up in Mount Vernon. They brought in a former biologist in the state of Washington, I believe he was, and he was now working some in Montana. And I think it was back in the Kalispell mountains, they put collars on all the grizzlies to where they could monitor them 24/7. And wherever the bears went, they left a yellow trail. And he showed that there were

only like two or three trails up high. And that's where supposedly all these bears are going to stay, up in the crests of the Cascades.

He showed another photograph of where the bears actually were. And then the river - - the bottom - - the valley bottom floors were just covered with yellow, so that's where they were. And you know - - you and I both know, you know, it's only 50 miles from the crest of the Cascades to here, you know. They said - - they said that the bears can travel 150 to 300 miles.

Well, they're going to go to the valley floors and they're going to eat the salmon and they're going to eat you - - your cattle, they're going to eat elk and the deer. And to say that that's not going to happen is foolishness because this - - this biologist proved it. The bears don't stay up high. They go where the easiest food is, which is in the valley floors. So that's it.

Correspondence: 110 SPEAKER:

Okay. I'm 110. I do at least 65 days a year of hiking, off-trail hiking. I run typically 30 cameras and I really keep an eye on, specifically in this area of the predator population and the decline of our deer population. Love to talk to the tribe guys. I got pictures of wolves in here, tons of lions.

But what I really want to share is this is a warning from my best friend in Kodiak. And he flies for Fish and Game, he does all their surveys. And he says "we have bears that walk through our streets, eat our trash and dog food. Bears are opportunistic feeders and will find the easiest, laziest place to eat, usually where people are.

Our bears are able to open car doors and they will kill livestock, a different one every night."

And on opening the doors, they have videos of them. They will literally go around to every door, and they will open the door and if there's a piece of gum in the glove box, they will absolutely shred the inside of the car to get to it. "We have relocated bears 40 miles away on a different island and they've returned in two weeks." They have the same type of climate that we have here. Their bears don't hibernate that are in town because once they get on a food source, they know that's a viable food source that stays, and so they just stay in and around the towns and they keep feeding and going through and killing the things that are there that are easily accessible to them.

And what happens is he said eventually those bears all get shot. I've had a good friend up there that got

mauled by a bear and they - - the bear actually scalped him. It grabbed him by the head and ripped his hair off. He was within a quarter mile of the airport in town. You guys need to realize what's going to happen when these things get down in the valley floor. It's not just eating the deer and elk. It's eating your pets, it's coming into town, your kids at the bus stops. Those are the real issues you have to deal with.

I'm number 120 and my name is [REDACTED] A

couple of things. When these things happen, somebody didn't just wake up one morning and decide that we're going to introduce bears to the North Cascades. There was some data presumably, some studies. And what I found over the years, somebody funds that stuff. So what I would encourage everybody to review, when they look at the environmental impact statement, find out where the money is that's proposing this. It's coming from somewhere. People just didn't wake up - - these fine people in the government services didn't just wake up one day and say let's put some bears in the - - in the North Cascades.

The environmental - - the Endangered Species Act has been around for 50 years. Where were they 50 years ago when they needed bears in the North Cascades? Somebody woke up, decided we're going to pay for a study from somewhere, some consultant - - consultants, and come up with some rationale to support putting bears back in the North Cascades. Somebody paid for that. Ask yourself who paid for it. Where did the money come from? Who is proposing this? Who is really behind it? That's all I have.

Correspondence: [REDACTED]:

Well, I'm just going to reiterate - - my

name is [REDACTED] I just want to reiterate some of the things that other people have said. This is an emotional issue. It's not based on common sense. Anybody that has any

modicum of common sense at all knows this is not a good idea. People are going to die. People are going to die. Just like the elk. People have died in car accidents with the elk now. And the elk was a good idea maybe, but now people have died. And you're going to lose - you're going to lose the loss of your access to the North Cascades because, you know, the incidents will take away high mountain hunting. Then they're going to take away hiking access in certain areas and pretty soon this area is going to be off limits. Pretty soon that area is going to be off limits. Pretty soon there won't be any place for all those people in Seattle and that gigantic population that wasn't here last time they had bears in the North Cascade, for them to hike. That's all I've got to say. Thank you.

Correspondence: UNIDENTIFIED SPEAKER:

Like everybody else up here, I am totally against the grizzly bears being reintroduced or introduced. My wife, she hikes - - goes up on a lot of these trails that you have, you know, the Cascades, that type of thing. She's up there by herself. I can't go.

Part of the reason why I'm wearing this is because I stepped on a bear. He wasn't dead. Yeah, it didn't work out so well. It's not the total reason. But anyhow, if that had been a grizzly bear, I wouldn't be here, right? I mean, it wound up - - obviously, it was a black bear. But we're going to have the interaction.

A couple of people here already have said, you know, what about a woman or their children or the elderly or whatever, it doesn't matter. I'm not a little guy. Before I got this brace on me, I could not stand against a grizzly bear. A black bear tends to run from you, a grizzly doesn't. We just don't need these things here.

The other thing that I am really scared about is transparency. We're not going to be told how many bears there actually are out there. We don't have a hotline for the cougar, we don't have a hotline for the - - for the black bears, right, whenever we have sightings or have issues or anything like that. We darn sure don't have one for the wolves.

You know, history has shown us we're not going to have one for the grizzly bear either. So when my wife says she wants to go walk - - hike this trail and we haven't heard

about any bears being up there, do we really know? Anyhow, I just - - that's something that really, really has me on edge about. So anyhow, that's it.

Correspondence: [REDACTED]

Hi, I'm 128, [REDACTED] I thought it was going to be a question and answer thing, so I didn't write out. So I'm not a great public speaker. I'll do what I can. The one thing that I find to be really objectionable is that the state of Washington has passed a law that says that we do not accept grizzly bear reintroduction. I think that it's very - - for the federal government to overstep that, I think is unacceptable.

When I go - - Montana, where there's bears, and I understand that Yellowstone is highly visited, but they have 1.1 million people. Idaho has two, Washington has 7.7 million people. So for the bear/human interaction, I think, you know, a lot of that 7.7 people like to recreate. That's why a lot of people live here. I think that's a huge increase in what we're going to see in bear/people interactions.

I think, also, what's been brought up earlier is that we - - I think there would be bears in the North Cascades. There would probably be bears in the Pasayten. If there was something for them to eat now, they would have migrated across the border and they would be here. There's not enough food to support the amount of grizzly bears that they want to reintroduce here.

What else? I think that's all I can think of right now, so.

Correspondence: I'm (inaudible). I live in Okanagan. I'm originally from Eatonville, Washington down by Mount Rainier. I'm a forester (inaudible) private citizen. I fully agree with the previous comments. We do need additional forester resources here in Okanagan County to help (inaudible) certain elements of our economy. While I said something that you'll probably all agree with, I'm now about to say something that will probably make you all laugh or nash your teeth at me. And I'm here in favor of reproduction of grizzlies. I've worked and recreated around grizzlies for the last years of my life. I've worked with

them in captivity both at Washington State University and Northwest Wildlife Park back down by Eatonville, and all in all, I'm not going to convince you tonight on the validity of bringing these animals back. That's not what the proceeding here is for. We're all here to talk about what we wanted, how we felt, and what will go on in the future. But ultimately, these conversations from (inaudible) of this is about safety in one form or another, the safety of our homes, the safety of our economic enterprises, our children, our families, and our landscapes, and none of those will be truly exclusive. There can be a day someday, I'm not sure when it is, I'll likely be an old man, but there can be a day when grizzlies and humans can safely exist on this landscape. I would much rather (inaudible) decisions over time and not just passively allowing and hoping perhaps one day a couple unlucky grizzlies wandered down from British Columbia. And at the end of the day, we can have both. We can work together. And this is never not something that cannot happen because we have different opinions. Cooperation and collaboration over time is the key in all things. Thank you.

Correspondence Type: Transcript

Correspondence:): Good evening. My name is [REDACTED]. I'm from the Methow Valley. No action alternative event. It is perfectly important that the public understands that two action plans of this EIS will result in a contract of federal agencies in Washington, D.C. will be required to enforce on public lands, whether those lands are federal, state or county, but also on your private properties. Make no mistake in understanding the extent the agencies reach. The park service U.S. Fish and Wildlife Services, as well as WDFW, are all promoting for the occupation of grizzly bears not just on the federal lands but onto state, public lands, as well into your communities. Page of the EIS cites a report from North Continental Divide Ecosystem that states, "Approximately percent of the recovery zone is in federal, Tribal, or state ownership, with only percent on private lands." The report goes on to say, "However, the majority of human grizzly bear conflicts and bear mortality occur on private lands, especially as grizzly bears expand their ranges." Again, in this document, and I quote, "The majority of human-grizzly bear conflicts and bear mortality occur on private lands." So read this contract. So what kind of human-grizzly bear conflicts are the agencies not willing to disclose either in the EIS or in your public meetings? I'll read just a small sampling of these conflicts, but first (inaudible) management policy language concerning their conduct and decision-making. These are your policies. National Park Service written policy states, The safety and health of employees, contractors, volunteers, and the public are core service values. In making decisions on matters concerning employees' safety and health, those managers must exercise good judgment and discretion, and above all, keep in mind that the safeguarding of human life must not be compromised. Their policy goes on to say, quote, The species does not based on an effective management plan pose a serious threat to the safety of people in parks, park resources, or persons or property within or outside park boundaries. Again, those are your rules. So here is a small sampling on the conflicts. And I did hand out something earlier today for those who got a copy of it. A woman was camping in the city limits, ripped from her tent, killed by a grizzly bear. Grizzly bear and cub euthanized after months of breaking into homes. Navy veteran had jaw torn off in horrifying grizzly attack. He was ambushed. Grizzly killed hiker and then broke into a home. Grizzly charges fisherman in Montana before getting killed. Grizzly bear mauls Montana (inaudible). Woman found dead in Montana following grizzly bear encounter. Grizzly attack two boys. Fourteen grizzlies euthanized, double the ten you're at. That was a single year. And if you believe - - Let me finish this paragraph. If you believe that bear spray will save you, know this. Empty bear spray cans have been found next to dead bodies of those killed by grizzlies. Grizzly proponents will say (inaudible) public education. Yet, attacks results in death or injury also occur against individuals expertly trained in how to protect themselves against grizzlies. My wife will finish the rest of this if she can. SPEAKER: . I am continuing the statement that my husband wrote and to the last sentence he said. The attacks resulted in death or injury also occurred in individuals expertly trained in how to protect themselves against grizzlies. So what are the consequences of these deaths and injuries? Federally referred to by the government as simply complex. According to either of the action plans, when human/grizzly conflicts occur in the park or in our communities, history has shown that very little occurs other than renewed efforts by the agencies to educate the public of the grizzlies' dangers. There is no pause button or intervention in either action plan when the grizzlies have (inaudible) substantial injured or a human, a hiker, a biker, a camper, or becomes conditioned, killed cattle, or starved to death, both action plans call for immediate replacement of the offending grizzlies on a one-for-one basis. But the loss of a human or a livestock has to happen first. Then a replacement grizzly is inserted right back into the recovery zone. In fact, county commissioners from both Chelan and Okanogan asked the same question that was just posed. What happens when the Agency's system is shown to be broken and

public safety is taking a back seat to continued grizzly attacks? The federal government declined to answer the question from either of the commissioners because there is no exit plan. In fact, there are no facts or limits in either duration or the number of incidents of attacks or conflicts that would occur either in our communities or in the park. There's no off-ramp, no threshold point in this contract that would dictate a pause in the intervention or reconsideration of continued insertions of grizzlies into the foothills bordering our communities. Once it starts, it does not end, regardless of the threat to public safety. So read the contract. If you think there is due process for affected states to request relief through an appeal that would (inaudible) grizzly, that process is by the federal agencies who are mistaken. Three recent cases make the point. Montana, Wyoming and Idaho have all filed formal - - formal petitions over the last two years for delisting the grizzly and despite viable populations of new grizzlies throughout three of these states, U.S. Fish and Wildlife Service has ignored these requests and maybe more today. Thank you.

Correspondence: I guess first back about ' they had a signing of one print. They were about to roll out of Leavenworth, so we were close, Leavenworth. (Inaudible) chasing elk (inaudible) place to go and it was either that fall or, like, six months later, I think it was the next year, I was taking a jaunt up Mission Creek, Cashmere, the back way up and over by Sand County up to Number Canyon Road. It was a place, it looked like it was slough off into nowhere, and so I went, I parked the rig, it was getting (inaudible). I started climbing up (inaudible) cool off. I was in this huckleberry patch. I heard something. I went around the huckleberry patch and then I smelled the bear and I've got a terrible nose. And I really don't know what bears, they smell like. Apparently, they don't smell good, the grizzly. So I went up to the top of that mountain almost, came on top of this kill, a bunch of sticks, about yards away. I did not see him. Crash. Crash. Crash. I had probably , yards away downhill. (Inaudible) downhill too. But he barked at me, like, you know, like this size dog, a good bark, you know, like a warning. So that's really pretty cool. I think that he's going to take this old route across a sunny slope. When I was in the late s and early s, I saw a few wolverines heading there, and I'm sure that's probably where he was heading to (inaudible) across, get up through the - - upper Lake Chelan. I seen a wolverine there and that wolverine did not want to be seen and neither did the grizzly, but I've met a lot of - - quite a number of people on the Pacific Crest Trail (inaudible) and there's this set goal to (inaudible) because they're so (inaudible).

Correspondence:): [REDACTED]. I'm from Manson, born and raised. My folks had part ownership with the Black Warrior Mine in (inaudible) by Cascade or Cascade Path. We have spent lots of time up in the woods hunting, getting crops for our orchards, you know, going with our children, running across the bears that we have that are simple brown bears, black bears, whatever they might be. It's a fearful situation. Having seen and read the situation with grizzly bears is much more serious. When I went to Alaska with - - I met a friend of ours who was with the Fish and Wildlife, we all had to be trained in firearms, shotguns, that someone in the group had to carry at all times. I think grizzly bears are a magnificent animal. I'm willing to go to Alaska to see them. If this was such a great area for grizzlies to be, they would have returned if we were the reason they're not here now. And so I would advocate that we don't bring the grizzly bear back, that we open the forests, and I also find it interesting that the week this news popped, the National Park Services in Eaton closed down long-term parking. So the Stehekin Wild or wilderness area has less access for people and so to me it just kind of seemed to fit. Thank you

Correspondence: For the record, I'm [REDACTED]. I'm the Okanagan County Republican Party Chairman, and during the regular Central Committee meeting in Okanagan County last Thursday, the Central Committee passed a resolution, and they would like me to read it. Resolution in favor of no action options of grizzly bear restoration in the North Cascades Ecosystem, otherwise referred to as NCE, whereas the National Park Service and the U.S. Fish and Wildlife have requested public input on a drafted Environmental Impact Statement, EIS, evaluating options for destroying grizzly bears to the NCE, whereas the EIS has been terminated by the previous administration, Secretary of the Interior, David Bernhardt, and no justification was provided to re-initiate the EIS process, whereas the EIS fails to document mitigation costs for citizens within the adjacent and adjacent to NCE loss of range, expense of fencing, depredation of domestic animals and livestock, livestock, et cetera, whereas the EIS fails to establish liability or set preparations for damages caused by the grizzly bears to individuals or businesses, whereas the EIS has exceeded the scope which is confined to the NCE but now includes two new areas, zone and zone , which impact more stakeholders than those associated with the NCE, whereas the law requires public lands to be managed for multiple use and the (j) rule as proposed seems to rely heavily on closures of roads and access, whereas the Washington Department of Fish and Wildlife is already prohibited from introducing grizzly bears from out of the area, and whereas the restoration project is a misuse of the Endangered Species Act because the grizzly bear versus - - I'm going to mess it up, the name - - is not in danger or threatened as a species due to existing healthy populations in significant parts of its traditional range. Therefore, we have resolved, the Okanagan County Republican Party, endorses and recommends that no action alternative in the EIS, and we have further resolved that this resolution be transmitted as a comment to the EIS and sent in at the Public Meeting at the Okanagan - - in Okanagan. Senator Republic - - to Representative [REDACTED] and Senator [REDACTED] (inaudible) and submit it into local newspapers. Thank you.

Correspondence: Okay. (Inaudible) I am in favor of option - - no option. Leave grizzly bear (inaudible). I also don't believe that grizzly bear was hunted. I think they left because of the food supply. If they want to bring grizzly bear back or any species of that size, they need to bring back the food supply. And we don't want to be the food supply, our livestock, our orchards, or our people. The other thing is the grizzly bear has - - the male has a -square mile area as much as, but what is (inaudible) if they go square miles, we're within square miles of the grizzly bear path. So if they aren't coming, they don't want to come, and I don't think we want to encourage them to come. Also, I don't believe - - I can (inaudible) a lot of people use a backup (inaudible) grizzly bear. No. They didn't use the word grizzly. I use it. They got the word bear, not the word grizzly. Probably they didn't know the difference. Most people can't tell the difference between a grizzly bear and a black bear. Anyway, that - - my comment is leave grizzly bear where it is. Thank you.

Correspondence: Okay. Option A, I am hopefully here to save a life, maybe the life of one of my grandchildren or my children who grew up hiking in the Cascades. This is one of the books we used to use to hike the trails. The second edition is at home. I brought this book that holds these photos because - - my name is Leon Homan (inaudible) and I am a business owner/operator. And one summer after a retired marine biologist of this area came to work for me one summer. I got to know him real well. I'm not going to mention his name here, but if you talk to me I will be happy to share it with you. He told me that there is grizzlies that come down through Canada and spend some time in the Cascades, but the habitat is not sustainable for permanent residency of any large grizzly bears. So to bring grizzly bears in, it's not sustainable for 'em. Where are they going to go? They're going to go on (inaudible) and start eating cattle, you know. It's going to happen sooner or later, somebody is going to get mauled. I guarantee it. There's two people up in Canada (inaudible) wilderness area last week, they were pulled out of their tents, a man and a woman and their dog were mauled to death. There will be mauling. Who is going to be accountable for that? And whatever tax dollars they've created, those tax dollars somehow probably go (inaudible) climate change, so who - - is that all in the Environmental Impact Statement? Probably not. But anyway, but my wife and I - - one of the trails that we select to hike was (inaudible), and about years ago we hiked that trail (inaudible) and I thought I seen a grizzly. I've been a avid hunter, a fisherman, involved in several bear hunts. I think I'm a pretty good judge of bears. I've probably seen a bear at least every year. And we've all had several successful bear hunts, killed two of 'em, one on my own, and I think I can tell what a black bear looks like, but briefly saw what I thought was a grizzly bear. Looked at him through my binoculars. We hiked back out. Two days later, this was on a Tuesday, went back in on Thursday. Got my zoom lens on my camera, went in, got as close as I dared to, packed in some heat, and I took some pictures of this bear. My neighbor worked for the Forest Service. He said, "I didn't see that." I sent six pictures. I got the negatives. Took three months to get the pictures back. He wrote on there - - that's all they did was sent me four pictures back of the six that I sent in and said that I took - - It just came back inconclusive because I didn't have any DNA evidence. But these pictures - - you want to see these pictures, you can email me at [REDACTED] We don't need them. They're already here. We don't need to reintroduce 'em or introduce 'em. They are here.

Correspondence: : I'm [REDACTED]. I'm a fourth generation rancher in Methow Valley. I grew up - - my dad was an outfitter. I've been in the outfitting business. (Inaudible) associations now. I've traveled the mountains in the North Cascades from the sawtooths clear down to - - to the hearts of Snoqualmie Path too and - - and - - up there and there have been no population of grizzlies up there. Back in ' , my dad cleaned the trail for a band of sheep there and he saw a grizzly crossing Pasayten there. That was the first time that I had heard of one. And then another one, back to ' , and do the same thing, and he said about the same year he saw one grizzly up in the Pasayten. I've lived up in the Pasayten in there taking out trail and building a new trail after the fires, and there's - - there's not the habitat up there for the grizzly bear. There never has been and there never will be. So you're going to put grizzly bear up there. What are they going to do? They're going to be right down in Winthrop. They're going to be right down in (inaudible) and they're going to be right down in (inaudible) because they're not going to stay up there. So I am opposed to it completely. I'm for A, no grizzly bear in there. So if it happens, somebody is going to be coming after you guys. Bingo.

Correspondence: Hi. I am from the Republic. I was (inaudible) one of the zones is actually on one of the alternatives to introduce the bear there. I think we already have a couple of grizzlies on Sherman Pass because I have seen (inaudible) to work for that have seen them. And I know there's some in Danville too that came across the border because I also have cattle that are there. But I - - I don't know how much you guys know about grizzlies, but I've read a little about grizzlies. Grizzlies in the right conditions can smell miles away. In a matter of time their claws get damaged and their claws are six, eight inches long. They go back. So I hike on a lot of - - I've hiked Pasayten, I've hiked in the Cascades. I haven't seen bear there. I have run into a mamma bear and two (inaudible) September of . By the time I saw her, she was already - - already standing up huffing at me, and that was one of my first fears as a lone hiker, but I want to hike so (inaudible) bears I backed out luckily, a little bears up (inaudible) the street. Then they came down to the trails. So I started staying in the cabin trying to be noisy. But anyway, if - - if bears are introduced, they're going to go to the garbage cans all over - - I'm sorry if I'm all over the wall. I was wondering if they thought about the (inaudible) that the grizzlies are going to get. Those are (inaudible) endangered. There's a lot of fishermen that fish in that (inaudible), and we should worry about the fish and the bull trout instead of grizzlies that aren't here, the species that are here that are already endangered that we should take care of. So that's something to think about. And bear-proof, bear containers are \$, . So if they come down, who's going to pay for those? The citizens aren't required by the public to have mandatory city garbage, but it might come down to that, and who here wants to pay that much to bear-proof a garbage container? I don't think anybody. And I'm for option A.

Correspondence: Yeah. My name is [REDACTED]. I grew up in Riverside. I live down in George. I am years old. I started hunting when I was . We used to go hunting (inaudible) every year, no problem. Now they want the cougar and they took the (inaudible) off the cougars. We have last year, they brought the wolves in. Last year a group got no deer. This year we got one. The problem is not - - I mean, these guys are super book smart but dumber than hell when it comes to what's going on in the environment. But anyway, you know, the problem with dealing with the bear, like you said, we'd bring them - - the bears in and get a bigger budget. So when they brought the cougar, they had to have more - - a bigger budget to watch out for cougars. They bring the wolves in. They need a bigger budget. They need to go back and fund them out of the hunting license, the tags, and the fishing license and not out of the general fund, and we'd have this whole problem solved. Anyway, we talked about the grizzlies. (Inaudible) the population in the state of Washington in ? Anybody have a guess? I have no idea, but I doubt if it's a million people. Now we're million people. I would go down to Riverside in - - what year was that - - ' and went to Seattle and then I come back to George. I am appalled at how many new houses are around Riverside from what it was when I left. So what's the population of Okanagan County? I think when I left it was around , . What is it now? , now. So that's how it's grown and you want to do all of these things and endanger us. So we need to just get rid of our game department and (inaudible). You don't see them bringing grizzlies in and bringing wolves in. That's all I have to say.

Correspondence:): My name is [REDACTED]. I'm number , but nobody was up here in front of me, so here I am. We don't need any grizzlies anywhere. Nobody needs grizzlies, nobody needs wolves, and the thing we need even less than that is the Department of Fish and Wildlife. These guys, they know nothing about fish. They don't care about wildlife. All they want to do is ruin the most important people, which is farmers and ranchers that grow our food. There is no reason for these people. There is no reason for grizzly bears. I want and I will - - any - - any grizzly bear that comes around my place, I'm shooting 'em, I trapping 'em, I'm poisoning. And that was what happened to 'em in the beginning. That's why they're not here now. We needed 'em out of here. We got 'em out of here. People need to smarten up. You people are the smart people. These, no.

They've never done anything right in the history of the world. And - - and government agencies like that are what's bringing us down. We'd all be prosperous people. We'd be in great shape without government entities like this. Why do we have fight 'em against this? It should be so easy. My friend Rob told me one time, he said, I don't know if he told me or I told him or whatever, but he said, It should be so easy to grow food for people. All you have to do is grow it, let them buy it, and that's how it would happen and everybody would do well if it wasn't for people fighting against us all of the time. Unneeded. I appreciate all of you people. You are the backbone of our country. Thanks a lot.

Correspondence: : I mean, that doesn't mean anything. It's a mess. First off, I want to start off with a little history lesson. In the s there was a fund started, the [REDACTED] Fund, cents out of every rifle, box of ammunition that was sold in the United States went into this fund. This fund was set up to keep trails, parks open, anything to do with wildlife conservation but nothing to do with the promotion of bringing wolves into the United States and populating them all through the country. Newt Gingrich took charge of that fund and when this process started he took \$ million out of that fund to get this wolf project going. And how much money has that cost everybody, you know. Plus, every time you buy a box of ammunition, cents goes into that. They can't manage the forest. You walk around the Okanagan National Forest, there is so much dead timber laying on the ground. When a fire gets into that area, I mean, it's just like pouring gasoline on it. Then the wolf conflict, though, I have a really good friend, a lady that owned the K Diamond K Ranch up in Republic, Washington, she's getting all kinds of animals killed by wolves. She's got 'em on video, pictures, everything. She's called up the Game Department. They came out there. Hands in the pockets. You know, and then guess what? They don't do anything. If it wasn't for the Colville Indians coming in and bringing hunters in the tribe because they can kill the wolves. They've only killed one, though, so far. It's basically what you call a good start. I've been hunting since . This last year was my last year going bear hunting again because the fact that they, the DNR and the game department, they ruined that area. All's it is is a giant fund for the game department because they haven't increased the big wolf population, but they have introduced the true (inaudible) which basically (inaudible) propagate the animals to be more like Montana and Colorado where a majority of these elk that are born, their first year of having been born, they'll have two points. That puts them out of the situation they can't be killed. They want to promote the big wolves because there is thousands of people that put in for that tag because there is some giant wolves in that area. That was a quick two - - two minutes. I'm about halfway through. Are you - - one real quick thing. A magnum weighs a lot. Carry a -millimeter, put Buffalo Bore bullets in it. First off, they're solid lead. When they hit, they destroy the rifling on the cartridge.

Correspondence: All right. Hello, everyone. My name is [REDACTED] and I'm here to support grizzly bear restoration on behalf of the National Parks Conservation Association, and I'm one of the six (inaudible) supporters. We're an organization that advocates for national parks. Our parks are spectacular places. And some of the (inaudible) the grizzly bear. I want to thank the National Park Service and the U.S. Fish and Wildlife Service for (inaudible) of this plan (inaudible) that is legally required to publicly (inaudible) and the right thing to do. Grizzlies provide collateral benefits to the ecosystem's health. They're expert diggers. They trend the soil and create seed beds for flowering plants and grasses and prevent (inaudible) alpiners and pine meadows. Grizzlies are an Endangered Species because there are not many of them left. They were shot, trapped, and poisoned to death before the North Cascades became a national park. To assume that they were recovering (inaudible) and wide-ranging ignores their biology. They reproduce slowly. They take years to raise their young and (inaudible) up to percent of their cubs die the first year of life. Successful rehabilitation of the North Cascades will take a century to reach just bears. By comparison, the (inaudible) has four times that number today. Since , there have been million visitors to Yellowstone National Park. During this time, people were injured by grizzly bears in the park. For all visitors

combined, the chance of being injured by a grizzly bear is one injury for every . million visits, and injury must be taken seriously but most are not caused by bears. The National Park Service has proposed the local population redesignation be designated as an experimental nonessential population that provides humans with more tools to discourage bears from coming into conflict with us. I hope you'll all learn about this and process (inaudible) essentially allows bears on federal land. Thank you.

Correspondence: : I'm Number . I just came from Ellensburg, Washington. I'm years old. I'm a geologist. I worked seven years in Alaska for the federal government, the U.S. Bureau of Mines. We were required and provided magnum revolvers for us to carry all of the time, plus a shotgun around camp. I had plenty encounters with grizzly bears there. People that have wildlife experience with grizzlies, there's plenty of places, Montana, Alaska, Idaho, Wyoming to see 'em. And what would your thinking be if it was your daughter that was killed in that little town in Montana sleeping in her tent in the middle of the night in a downtown park, or your son that worked for the forester right outside Glacier Park and he was just on a little bike ride on his mountain bike, a trail he's gone up many times before, and was killed by a grizzly. In Glacier National Park they require you to carry bear spray. I also am an avid hiker. I grew up in Ellensburg, Washington. I do parts of the Pacific Crest Trail. On the Pacific Crest Trail they have such a problem with bears down there, everyone is required to carry over miles a heavy metal bear can or a heavy-duty plastic bear can. Is that (inaudible) to all of the trails up here now. And also, after the seventies I have a few friends, her dad saw a grizzly bears up around (inaudible). I have friends that lived up in Oroville and they went with their family hiking and horseback riding in the (inaudible). They buried (inaudible) -gallon drums at the horse camp five feet under the ground. They came back the next summer and grizzly bears had dug them all up, opened 'em all up. And the latest encounter of a grizzly, someone saw a grizzly right outside of Leavenworth this July, and a hiker saw a grizzly just in north parts past a couple years ago. So they're around and I put - - I always, always - - I put in that statement I sent in last fall - - a quick review of this, I didn't see anything. I wanted a statement of all incidents in the last hundred years and how much it cost in medical and insurance and if the government was paying for everyone's funerals and the rehabilitations from being killed by grizzlies or injured by grizzlies, and the cost of all of that. I would love to see that in a Environmental Impact Statement. And I'm for no action, and there's plenty of places to go see 'em. And like some other people have mentioned, you know, a hundred years ago we didn't have all of these houses and all of the highways, so if we want to bring them back like it was years ago, why don't we just close North Cascades Highway (inaudible), all of those roads -

Correspondence: I'm number , and I'm no public speaker, but I am a wildlife artist, and I am a grandmother of five beautiful grandchildren, and I have two of them, they're growing up to be artists, and that is thrilling to me. So I had a young moose feet out of my window sitting in the foothills of the mountains, and that was a very thrilling moment for me. I am a hunter but I also love beauty of our wildlife. There was a book written by Ted Lyons and Will Graves. These guys went to Russia to learn about the devastation of the wolves in Russia. If you want to read a book called "The Real Wolf" and really know what this is all about, get yourself a copy and read it. Okay. Also, there was a gentleman named Ted Oxman (phonetic). He was the first private patrolman in Yellowstone National Park and he watched these wolves disburse, and the first thing that they picked on and destroyed were the moose, which doesn't make me (inaudible). There used to be three dozen moose up in the (inaudible) drainage area in Wyoming, and they - - this guy would go up there, an older gentleman, would go up there and he'd see three dozen moose in one trip, and now he says if you see two, you're really lucky. They were supposed to stay in the park, but because the - - the prey base was great up there, well, they didn't stay in the park. They came out of the park and they went into Wyoming and they went all over the place in Idaho and Montana and every place else. So do you think I want them introducing a - - what I call an alpha predator into our area when I have a moose standing feet out of my window? I have whitetail and needle deers and cougars, which I'm afraid of cougars but they're beautiful. Do I want any of this animals killed? No. Do I think grizzly bears are beautiful? Yeah. I'm a wildlife artist. Why wouldn't I? But do I want to take my children up into the mountains, my grandbabies, eight and -Do I want to take 'em up there and put their life at risk to teach them how to do what I do, photograph these animals? No. Think about it. We don't want 'em. I'm for no way.

Correspondence:): Good evening. My name is [REDACTED], your tonight. And I'm not one to - - but as I (inaudible) north end (inaudible), I think I'm your (inaudible) and I'll thank you for that (inaudible). Does Yellowstone have , acres of orchard next to it anywhere? Does it? UNIDENTIFIED SPEAKER: Not that I'm aware of. SPEAKER: I guess my concern is in the foothills of the Cascades (inaudible) orchards right up to them. If we have an apex predator, they can smell for - plus miles. He wakes up hungry and he's out in the lower elevation, it doesn't sound like (inaudible) fulfill his caloric intake so he can mass up for the winter and survive and he (inaudible). When he comes out in the spring, he's going to be preying on things down low, so it's going to be his first available food source. So it's mainly going to put trouble with cattle ranchers and orchards. We have these things called bees that we used to pollinate with and we put these things out in foot by pallets, standard around the orchards. We're having a hell of time right now trying to keep our bees here because our bees are being preyed upon by the natural predator loss (inaudible) killing our bee population. The last thing we need to do is bring in bears to see how many crates of bees they tear up every spring and scatter throughout (inaudible). We don't need that. What we need is to be able to pay attention, think about surroundings we're going to introduce these (inaudible) into. This is not the proper surroundings for that. We have an overabundance of apex predators (inaudible) wolverine trail and I (inaudible) but I believe there is no food up there to supply a -mile area after the great fire up there in (inaudible) , acres. It burned so hot, that area isn't regrown seven years. It is a food dessert (inaudible) - - thank you.

Correspondence Type: Transcript

Correspondence: Good evening. Okanagan County Commissioner Chris Branch. I just have the same comments to make that the other commissioners weren't prepared to comment and one was not available, and but I know my fellow commissioners and I know what they feel about the grizzly bear and I know they oppose the grizzly bears' introduction, so I'm sure option would be what I report as the chair for the Board of Commissioners. Now, to share a little bit, what my own opinion is I formed it over a while and it certainly was happening with wolves. What I see more often than anything not is there's a lot of our community against itself, and I don't like that at all. We have a (inaudible) vision we're dealing with in our community and this country, and heaven sake for me, arguing the grizzly bear issue is not getting at some of the most

important issues that we have to face today. Crime is one. Mental health is another one. And I think about the grizzly bear introduction and I think about the wolves, and I think about the fact that we have management programs. If they don't do what we tell them to do against the animals, then we have to go and shoot 'em. And (inaudible) in grizzly bears. Think about the fact that if it doesn't work out, we take out the pack, we take out the bears. I don't know if I like that management technique at all. And so I - - my job here is to listen to people in this county, and I've heard a lot of opinions here. I'm opposing having the grizzly bear introduced. I do believe the grizzly bear will be in the North Cascades one way or the other, but I don't think we have to introduce 'em and I really hate to see us, you know, again, pitting ourselves against each other trying to - - trying to figure out what to do with them after we get 'em introduced and trying to manage 'em. We have to be good at that. And unless there's a way that you can tell me that we can be really good at it like management in the North Cascades, I'm ready to listen. Thank you.

Correspondence: : I'm going to take the first minute to read this thing from the director of U.S. Fish and Wildlife Services. He stated it before Congress, that the grizzly is biologically recovered. He said this based on (inaudible) grizzlies in Montana, Wyoming, Idaho and Canada. In fact, there's so many grizzlies inside and outside the recovery zones that the government is counting (inaudible) management policy. I'd like to say intentional - - intentional information relevant information in any environmental impact statement is the same as lying to the public. As a result of the (inaudible) management programs and leadership within the federal government stating agencies understands, oh, well, (inaudible) are ongoing in the (inaudible) recovery zone. If he takes this bill with these reckless grizzly management plans inside Washington State, they would have done so by lying to the public and cheating the system. The only other thing I would offer to you guys is that I had a friend running a feed store over in Black Diamond a few years ago when a young grizzly (inaudible) hunting food. He moved to Idaho because that's what he did. He hunted cougars. I saw him in the store here not too long ago. I said, What are you doing, and he said there's so many predatorial cougars here now that they hired me by the hour to come back over here with my dogs to kill cougars. So instead of going out and paying for a license and handling the dogs hunting 'em, the government is now paying him to go out and hunt predatory cougars. I see the same thing happening with grizzlies. There's been a lot of talk about Endangered Species. We are the endangered species. Between the fires and grasshoppers and - - and the wolves and the cougars and now we'll have grizzly bears doing things, no. No more grizzlies.

Correspondence: Hi, I'm [REDACTED] (phonetic). I'm number . I'm with the Chelan County Farm Bureau and we are in support of option or A, no reintroduction of the grizzly bear. I have to ask, if this administration is so desperate to increase the salmon population out in Columbia, they're willing to reach dams, why introduce an apex predator whose main diet is salmon? Two, the gentleman that came before me spoke eloquently about the bees. That's something they'll go after. Another sweet treat bears like to eat right before hibernation is pears. Where is the central location of pears in this state? Dryden, Shasta, Wentworth. This will put grizzly bears in direct contact with our orchards. And once bears take a stab in the orchard, good luck getting a crew in there to work. It will never happen. Thank you for your time.

Correspondence: I am number , Stacey Storm. I'm speaking on behalf of the no action option regarding the grizzly bear recovery in the North Cascades. The grizzly bear is a predator. It does not make a distinction between deer, elk, cattle, sheep, cats, or even people. It simply sees its next meal. The DNJ experimental role focuses on education and closures as a way of mitigating the potential problems the bear may cause. The education portion advocates bear-proof storage and feeds and garbage, special fencing and so on. However, there is no mention of who bears the cost of these measures. There is no mention of liability should a bear damage private property or injure livestock, fence, or even people. There is no mention of compensation for losses. Citizens need access to our public lands for any uses including grazing and recreation. These activities remain relative to the economy in many ways. What compensation is provided before you're unable to enjoy these activities due to closures for the grizzly? The pleasure of viewing grizzlies in the wild has been mentioned as a positive, but there are healthy populations with grizzly in significant other parts of its range. One can view them there. And incidentally, there have been a number of reports of people being killed or injured by grizzlies in those areas. I strongly encourage the no action, option A, to be taken in this matter.

Received: Nov,27 2023

Correspondence Type: Other

Correspondence: The Commission of Back Country Horsemen in Washington is specifically concerned with keeping the trails and trailheads open and accessible. The proposed alternatives B and C do not provide any protection for recreation. The meaningful impact study, those management options under recreation have not been included in the EIS. Without better alternatives back country horsemen of Washington will accept only alternative A, no action. And an additional concern is mentioned of the concept of the wilderness plans in the back country and the wilderness to control the number of people in a area for recreational activities. This includes (inaudible) users and (inaudible). The EIS planners also need to realize that both the specific Northwest Trail, the National Scenic Trail, and the north end of the Pacific Crest Trail, also a national trail, cut across North Central Ecosystem area. Back Country Horsemen in Washington is concerned that the (j) rule could be used to restrict, regulate, and/or close access over a longer term if agencies perceive a threat to recovery of grizzly bears. Washington State Law RCW . . specifically states grizzly bears shall not be transplanted or introduced into a state. In addition, the following comments are my own opinion as a resident of Methow Valley. The proponents in their rush to relocate grizzly bears in the North Central Ecosystem have left the seriousness of human-bear conflicts. Washington State's population is greater than the combined populations of Idaho, Wyoming and Montana, the states where grizzly bears are currently located in the Continental U.S. This large population will lead to greater likelihood of conflict, destruction of property, maulings, and deaths of our citizens.

Correspondence: My name is [REDACTED] (phonetic) and I am strongly in favor of Option A, no action. I am a fifth generation cattle rancher, and my day to-day job is in zone , which is inside the black lines of your map. I was raised as starting as a two-year-old on the back of a pony out in the Forest Service and (inaudible) cattle, and I have continued that way of life with my own two children. We are not willing to die by the hands of a grizzly bear. Your goals have already significantly compromised my safety on a day-to-day basis. I've already trained myself to use firearms and to carry firearms, as do my and -year-old children in the event that we were to come in contact with a wolverine to save our own lives. I know for a fact that a can of bear spray is not going to save me. Neither is my -millimeter that I carry right here. It is not enough to save me from a grizzly bear. So I absolutely do not want that kind of hazard. It is very personal to me. I find you liable for my safety, for my husband's safety, for my children's safety, for my dad's safety, and a lot of the other people in this room go to work on those forests every single day. Further, I live in zone just on the edge of your line. You tried to rehabilitate a little black bear. You dumped him out in the Pasayten wilderness with a leather collar on his neck, and he was in my garage eating

dog food two weeks later. That's the reality of what you're about to do. Translocation is going to dump bears confused, scared, and lost into an ecosystem that has no food supply because you burned it all. There's nothing out there for them. They're going to be in my yard. And I consider you personally liable for that, as well as the other folks that work for the agencies in this room. You all - - and the people who are supporting it. You have to put yourself in our shoes. What are you going to eat when I go out of business?

Correspondence: Hi, I'm number . My name is [REDACTED] We moved here from Alaska five years ago. I spent years in Alaskan cold, long winters. We have a little bit of experience with wolves, grizzly bears, and things like that. In I spent one year in New Boise, Wyoming, when they reintroduced the wolves there. We told them then you are not reintroducing Endangered Species in this country. You are reintroducing an Alaska wolf. There's a difference. They don't kill just to eat. They kill just for fun. This spring I went on a trip. I come home. Our six-month-old calves are chained in the pasture. We just upgraded them from the (inaudible). They're nose to nose with five wolves, five Alaskan gray wolves. This year we have more calves on (inaudible). We just had a report that there's collared wolves hanging in a pack of nine right up above us on the mountain. I should have tagged my cows. I should have named them kibbles and bits because that's what they're going to be. They're bait. Now you guys want to reintroduce grizzly bears. This country is not ready for any more grizzly bears than what already lives here. They just saw one in Colville. You tagged it. You collared it. They're here. They're already here. But they're already appearing in the capacity that this country can take. And I'm going to say this in the simplest form I can. When you start messing with mother nature like adjusting the balance of things, especially predators, you're going to lose every single time, and that's what's happening.

Outside Organization: Okanogan County Sheriff County Government(Official Rep.)

Received: Nov,27 2023

Correspondence Type: Transcript

Correspondence: All right. So mine is a little different from the rest of it. My job as your county sheriff as I present you (inaudible) introducing the bear for the mere fact that I wasn't here to help protect you from the wolves introduction, but I am here to help with this one. Local government has a responsibility to protect local taxpayers, to preserve the value of private property, and to promote local economies to build in general and ensure the health of welfare, economy, and socially of all of its communities. Counties in western states, mainly all I care about is Okanogan County today, that's why I'm out here for sure. That's all I care about is Okanogan County. But if you put 'em into (inaudible) County or (inaudible) County, they're coming into Okanogan County. And trust me, if they attack or go after a person, I'm not going to get into a pissing match with a U.S. Wildlife agent telling me I can't shoot the bear like they did with the last sheriff who had a problem with a wolf, and they told him they were going to arrest him. You will not arrest me in Okanogan County. I will take care of the problem. Federal land manager (inaudible), she was directly and often profoundly impacted to joining and coping with as well as civil liberties, local cultures and economics of residents living adjacent to or within these governing lands counties. Federal policies in all - - in projects also impact the danger of rights to private landowners. Those rights, for instance, in your use of control and use of the land, claims of water rights, and access to rights of ways and grazing, introducing these bears to the forest will bring ((inaudible) their herds. We can't allow that. The other side of that is I'm an avid hunter, avid horseback rider. I am - - I have friends who run (inaudible) who go into these areas of the homes. You will be impacted with your livelihood. Bringing them here will attack the livelihood 'cause this whole Okanogan County, we are probably one of the poorest counties in the state. Bringing them here to stop tourists from coming here. People aren't going to come here to go say I want to see a grizzly 'cause they'll be eaten by the grizzly if they see it. They won't be able to - - they'll shut down the areas that they go hiking that we have hiking abilities and stuff like that now so we don't have - - we cannot do that. So one thing that I know I want to say is there's a coordination process. I'm invoking coordination at this moment, if that means anything. I

don't know if the commissioners - - I know they've talked about it. There - - introduce 'em. The RCW says there will be no introduction. That's - - that's a benefit if they do decide they want to introduce 'em 'cause I'm not going to arrest them.

Correspondence: My name is [REDACTED]. I've probably spent more time in the wilderness than anybody here. I've been a wilderness ranger since . I have lived - - in fact, the last six years I have lived back here every other week in Pasayten. I spend a lot of time (inaudible) the last five years. I've done a lot back there even with the fire. But I wanted to remind you, I don't know if it's in your environmental deal, but you have the City Crest Trail and the City Northwest Trail, they cross right in the middle of your section, and I saw the increased number of people coming through. So we have hundreds now, but between the two, we'll have thousands or a thousand, I should say, and that's a huge - - interaction, a collision between deer life and the idea of recreation in the wilderness, and I just don't see how that's going to work. The other thing is the fires that have been there the last five years, I just got out of it. Part of the - - oops, I lost my voice. Because of the fires, it's also reducing (inaudible) talk about how much area square miles grizzly bear has in their range, and it's becoming smaller and smaller, so smaller and smaller range, more and more people, and the human interactions, I don't see how they can allow for that. The next thing I want to mention is they were talking about experimental population. Any time you experiment, you don't know the outcome. You can guess what the outcome is and you can think what the outcome is, but nobody knows for sure what the outcome will be. And I - - I don't know if it's worth the risk with all of the human action - - human interaction we have. So I don't have a lot to say except I know that next year is an election year. I'm not sure why - - maybe that's why this - - you're trying to get it through till next year, because and maybe this won't go through, but I'd ask you publicly to consider all of the people. I see increased use of our - - our woods and our wilderness area, and I just don't see a compatible way to do it without a lot of grizzly-human interaction. I just don't see that. Thank you very much.

Correspondence: My name is [REDACTED]. I own one of the oldest homesteads in (inaudible). I'm very blessed. I'm sure I won't be around by the time the grizzlies overrun that place, but I just wanted to point out that we've all - - we all kind of know this, but we've seen again tonight the federal government can barely run the stopwatch. I think we ought to focus on some of the projects that already have been started and mismanaged, and maybe we fix some of the problems we already have, people we worry about. Whether or not we need bears, plants and flowers (inaudible) to be safe. I have a lot I want to say, but I'll (inaudible) the rest of my time.

Correspondence: My name is [REDACTED]. I'm (inaudible). I'm a political refugee from California. Politics (inaudible). Okay. I don't know who came up with this idea or who all is backing it, but I have this question for those who have this concept and feel it needs to be implemented. Once the human death tolls are shooting up on this, and it's not if, it's when, are you ready to accept the blood on your hands? And the silence is deafening. If you're not willing to accept the responsibility for what goes down in this county from the actions that you take, you have no business taking those actions, period.

Correspondence: My number wasn't up there, but I see all of the chairs are empty. So I'm [REDACTED] and my question is, why are we here again? It's against the law. Senator Mortin when he was still in the legislature passed that piece of legislation that said there will be no grizzly bear introduction in Okanagan County. If they wander in, fine. But if not, it's against the law, period. I know there's a certain segment of the population that believes they're above the law. My message is vote 'em out. In , the county commissioners enlisted a grizzly bear expert from the state of Montana to come here and survey the Pasayten and Okanagan County. He came back and his report said the Pasayten wilderness has no food for grizzly bears, and it all runs to the valley floor. Then he further said you have , acres of tree food in Okanagan County. If you introduce the bears, that's where they're going to be, not up there, down here. And that was a survey that was done and this guy was hired to come in here and do that. We saw the same thing with the wolf. You know, they violated the very Endangered Species Act stipulates in there that if you're going to introduce a species, it has to be an indigenous species, not a -pound Mackenzie arctic wolf. But they ignored that, and what do we have? So I say I don't know how it's got to this point, but if it does go any farther, send measures back to our congressman and tell him do not fund it. And if that doesn't work, then I refer to - - when I was a county commissioner, I called up the office in (inaudible). We enlisted our native American friends to come and hunt wolves because nobody will say a word if they kill one, and it worked in -

Correspondence: Hello. My name is [REDACTED] and - - So my wife and I moved to the Okanagan Valley area years ago, and so we're - - we're not as well-rated in this community as some of the people who have spoken here in this room, but we have come to actually love where we live and we live right at the boundary outside the (inaudible), right in the boundary on the map of the subpart of zone . My wife and I are pretty reasonable people, and I hear all of the folks here speaking today are reasonable people and my (inaudible) the reasons for it. I'm an outdoorsman. I spend a lot of time out in the woods and the mountains around the valley hunting and skiing and all of that. And a lot of grizzly bears. Four years ago my wife and I were here and we spoke against the introduction of grizzly bears. I'm here today again because as a reasonable person that lives in the area that you want to put grizzly bears, I would say no, thank you, we don't think it's a good idea. And I'll tell you, I don't think it's a good idea for a lot of reasons. All of these wonderful opinions that are being expressed today, I have (inaudible) lot and know a lot of it, and it's just when you look at the possible downsize where the - - the downsize just weighed - - outweighed what could happen and be bad for the people, for the bears themselves who are hungry. So I'm an attorney and so I - - I - - I (inaudible) all of the time, so I'm interested in this process. So the process is - - it says they're supposed to be listening to us. Before you make your decision on the EIS and other decisions, you aren't listening to the people who are living where you want to put the grizzly bears. I hope there is no more important public comment than you ever received in this room of people obviously, and it's overwhelmingly against bringing back grizzly bears. So I hope that you listen to that. And, by the way, all of the questions about who will be taking responsibility, on that map it says that the federal agency not be held liable for any actions taken on the basis of that map book.

Correspondence: I'm a fruit grower in the Central Valley here in the wild west of Omak. I grow apples and pears. That issue was brought every year. I think another thing that should be considered is the effect to bring an apex predator up in the upper valleys has on potential prey moving down into the valleys to escape apex predators, and they draw the apex predator down into those areas. These forest fires we've had in recent years have really, really (inaudible) the deer population in my area and (inaudible) up here no deer (inaudible) all of the time feeding on my trees and causing damage. They're not the main problem to me. If a bear went out and chewed on my trees, but a bear may be cause for their prey down into the area to cause problems as a secondary effect. It just doesn't make any sense. The adding more things up in the higher range drive more animals down into the lower valleys and cause problems that would not be there otherwise.

Correspondence: Okay. So I'm going to state to my understanding without really hard core study of the issue and so forth. It would seem just from a natural day-to-day standpoint when we're having more - - the predators that we do have here, like cougars, are having trouble finding - - supporting their population and they're showing up in the rural communities looking for an easy meal - - domestic cats, dogs, whatever. You kind of have to think, well, you know, if the system out there can't support more predators, you know, with the wolf thing and the - - in the Ferry County where they had, I believe, that's where they had a pack there that ended up preying on domestic cattle; that they came to the point eventually where they eliminated the entire pack. And so, at least that was my understanding from reading, you know, the newspapers and so forth. Well, and then to be honest with you, I mean, many people may not share this, but I start to feel sorry for the animals. What about, you know, those animals that they're relocating; they're living a life where they're at and now they're put into a situation where, well, if they're a good little animal and don't do anything bad we'll leave them alone. But the instant they hurt a person or something else then all of a sudden there's a posse after them. How is that fair? How is that fair to the animals? I mean, these are grand animals really - - these predators that - - on the upper end of the food chain. They - - how is it fair anywhere along - - economically, how does it make sense? What about the first hikers in the North Cascades that have a grizzly experience and it doesn't turn out well for them and who's paying for the rescue and who's paying to come in and clean up? And who's - - you know, what is going to happen to that animal? Those are things that concern me. Other than that, my own personal safety I'm not concerned with but, yeah, I'm going to leave it at that. Like I said, it's not much but it's a little.

Correspondence: Okay. My name is [REDACTED] and I live in Twisp. I live on a farm bordering public land where we raise livestock. I'm an avid hiker and backpacker and I support Alternative C, active grizzly bear reintroduction alongside a (j) designation. Grizzly bears were an integral part of our ecosystem here for thousands of years until we humans hunted and trapped them to local extinction. The North Cascades is ideal grizzly bear habitat. We are fortunate to live so close to these amazing wilderness areas that comprise nearly , square miles of public lands. We have the space for bears. While grizzlies are incredibly powerful animals, there has also been so much misinformation spread about this Keystone species. Reintroduction is something to take seriously but it is totally doable here. I have family in western Montana and have seen firsthand how rural communities that are very similar to ours socially, economically, and culturally are already living, recreating, and thriving alongside grizzly bears and we can, too. Preventative coexistence tools like electric fencing, carcass composting programs, and bear-proof garbage containers have been proven to work. This time around we also have an incredible tool in the (j) designation. This will allow our local communities to have more management flexibility should any conflicts with bears arise giving us more agency in the process. Here in Washington and around the globe, we're facing a biodiversity crisis of immense proportion. Grizzly bears are an endangered species that deserve to be here in the North Cascades and we as a community have a chance to bring them back making our ecosystem more resilient for future generations by doing so.

Correspondence: My name is [REDACTED]. I'm with the Chelan, Douglas County Farm Bureau. I am supporting Option Number One, no action. We are talking about introducing an apex predator that will be in direct contact with hikers along the Pacific Crest Trail. We're also talking about introducing an apex predator that can eat up to salmon a day. If Fish and Wildlife and Ecology are truly concerned about salmon, why are we introducing an apex predator that can wipe out that population before it's even started? Also, bears' second favorite food are pears. The direct area that they're intended to be introduced in, Dryden/Peshastin to Chelan County in the direct zone for the introduction is where these pears are. They are definitely going to go find their favorite sweet food and eat it. Once that happens, it will be impossible to ever get a crew back into that orchard again just that humans are scared. I mean, these are apex predators. They can take us out. I wouldn't want to work in a field that has had bear scat in it, either. Thank you. Please support Option A.

Correspondence: I have spent the - - since I was years old I've lived - - I've not lived - - I have worked and outfitted in the Pasayten/Sawtooth Wilderness range and never seen a sign of grizzly bear. The earliest - - the latest sign I have ever heard of a grizzly bear being sighted within the North Cascades was . That was years ago and was one grizzly bear for a brief moment. That is when I - - that is when I have heard of the last grizzly bear and it was up towards the Canadian border. A grizzly bear - - it's common sense, it's common sense. Grizzly bears don't want to be here. They shouldn't be here because they don't want to be. We do not have the ecosystem to support it. We don't have the land management to support grizzly bears as well. We saw in with the Diamond Point fire all those deer, and those were the deer, they got pushed down into the low ends of the valley. They got pushed down into the low ends of the valley. Are the grizzly bears going to follow them? Absolutely. The grizzly bears are going to follow the bear or the deer - - the grizzly bears are going to follow the deer into the lowlands of the valley and they're going to get pushed by fire because we don't have the land management to support a grizzly bear. We don't have the space to support a grizzly bear. Grizzly bears - - I want people to stop calling it a "reintroduction" because I want people to call it what it is, an introduction of grizzly bears. There's never been grizzly bears here. There's no - - I take that back. There's not really any proof to prove that grizzly bears have been here within the last years. Yet, they want to introduce them, they want to introduce them when they weren't here. They're going to come down to the valley. They're going to eat cows, they're going to eat garbage, and they're going to eat people. That's that.

Correspondence: Okay. My name is [REDACTED] from Malott, Washington, resident of Okanogan County. I do not agree with introducing grizzly bears to the North Cascades at all. They haven't been here for decades. There's no use for them here now. We don't have the wildlife to support it. I've hunted Okanogan County for over years. We've had a steep decline in the game out here. My biggest fear is human interaction with negative effects for one's wellbeing by being maimed or killed by a grizzly bear. Livestock - - with the federal government trying to reintroduce the grizzly bear, it's going to place it upon the citizens to protect their property and their loved ones and that's too big a burden that we currently don't have to deal with. We're already in the middle of mismanaged forests, over-grazing, and other challenges that government resources would be better spent on than trying to reintroduce the grizzly bears. All right. Cool. Appreciate your time.

Correspondence: Okay. It's just about two pages. Okay. I'm against the proposal to install grizzly bears in the North Cascades or anywhere in Washington State. I believe that just because something once was historically the case, it's not - - it's not a good rationale for why it should be so in modern times. Many things have changed since the grizzlies were reported to have been here in the region. Today there are many more people living, working, and recreating here. Farming and ranching are common in Okanogan County. We have an abundance of fruit orchards here which are known attractants for bears. None of the people here have a working memory of existing with grizzlies or of the challenges that this would require. I will take my own neighborhood community as an example of what has changed in just over the past years. A century ago there was virtually no one living in our neighborhood. Today we have about residential properties, horse ranches, a state park campsite,

a hotel, a golf course, vineyards, and orchards. My neighbors enjoy being out walking, hiking, fishing, camping, and hunting in the wild and beautiful areas in which we live. We have a very healthy native black bear population and we see them frequently. This is their home and we coexist well for the most part. We do not find them to be at all an aggressive bear. A simple awareness of them and a few easy measures help to keep it that way. My concern is that grizzlies are not the same kind of bear. They are significantly larger in size at an average of pounds, which is at nationalgeographic.com. Male grizzlies have been known to achieve sizes far larger. In addition to their powerful large size, they can be very fast having been clocked at speeds up to miles an hour. That was nps.gov.yellowstone. They can be aggressive in nature. My family had the opportunity to visit Yellowstone Park in the summer of August . While we were there a -year-old boy was charged and attacked, pulled off his bike while he was riding through the park with his family by a grizzly bear. He was simply out with his family when the grizzly charged him from the brush. Nothing was done to that bear in follow-up, as it was just being a grizzly. Coexisting with these large apex predators imposes an extra measure of wariness and caution to those who live, work, and recreate near them. Grizzlies are attracted to human food, food scents, and human garbage. In the neighborhood where we stayed in west Yellowstone, the homeowners had to have very expensive large metal dumpsters just to discourage them. People are instructed to not leave any food out and to thoroughly clean barbecues after every use. They're instructed to harvest their gardens rapidly and not leave fruit on the trees. For obvious reasons, that does not work well in a community where fruit is under harvest for months at a time. In , the City of Cody, Wyoming, had to put up a permanent electric fence around its landfill due to it becoming an undesirable attraction for grizzlies. In addition, grizzlies are attracted to fruit. I guess I already said that. Let's see. Grizzlies follow food sources and will be drawn into these orchards that workers frequent. They eat other animals. Most of us have pets and many have livestock. Chickens, goats, cattle, and horses are all very common here. Some of the proposed drop sites are within miles or less of working ranches. This seems to be avoiding the science of how grizzlies behave around cattle. Unfortunately, grizzlies also do attack, kill, and have even been known to consume humans. Public safety should always trump a desire to import an omnivore that is of no real benefit to the community. It seems entirely irresponsible to bring an apex predator like that here. The argument that the most likely proposal will only include an initial restoration of to grizzlies seems shortsighted to the eventual impact here. Grizzlies have a very large territory. For an adult female grizzly, it is about square miles but for the average adult male, the home range can be up to square miles, westernwildlife.org. They will tend to follow food sources. It will not take long for a bear population once established to spread out into our communities. A further concern is that there is no clear communication as to how the population would be managed. Once it does reach its primary target of grizzlies, how will the population be held in check? If one looks to the grizzlies of the Greater Yellowstone now numbering in excess of , there is great cause for concern. The bears have spread beyond the initial target zone and conflicts with grizzlies and humans is escalating all the time. Grizzlies are spreading onto private lands. The US Fish and Wildlife Service removed the Yellowstone grizzlies once from the Endangered Species Act in . A limited amount of hunting was to be allowed in a tightly regulated fashion in order to better manage the population. But a federal judge restored protection and removed hunting as a management tool. Where does that leave citizens? The credibility of those charged and entrusted with responsible management of the situation is left to be questioned. In addition, we are not set up to inform the public of the risks. We are not Yellowstone Park with gated ticketed entries and information packets and a vast array of rangers. How will you adequately prepare for people for a bear they would not ordinarily ever expect to encounter locally? We have already had to cope with the recent installation of wolves into our communities. Many have suffered devastating losses to their livestock and at great personal distress. It has been too brief of a period to have adequately studied the long term impact of importing the wolf apex predator, and yet there is now a desire to install another large and possibly more dangerous apex predator here with the grizzly. We imagine people in more populated areas would not want a dangerous predator released into their local parks where people and animals congregate. We simply ask for the same courtesy. The citizens of north central Washington do not wish to be your Jurassic Park experiment.

Correspondence: Okay. The idea of bees was brought up and being very familiar with omnivores, when they're hungry that's exactly what they're going to do. They're going to make a straight beeline down to the easiest food source they can find. In the springtime, obviously bees are going to be, I mean, a priority for them. I mean, that's an easy meal, high calories; I mean, that's going to for sure happen. And then in the fall what does the - - what does the State have planned for

compensation for the orchards because a bear will do tremendous damage to an orchard. And that is by far the easiest food source. Because they're basically big dogs; they're lazy. They just want an easy food source, whether it be a trash can, a - - whatever. They're a giant raccoon, think of it as. I mean, they can be super vicious in the right circumstances, but a huge orchard with apples down and pears down on the ground and on the trees as well is going to be a magnet. And if you've ever seen what a bear does to an orchard, they don't just pick the - - I mean, they rip branches. I mean, they absolutely trash an orchard. And then the one gal pointed out good luck getting some of your out-of-town help to go in and harvest whatever crop is left in there because where they come from this terrifies the living hell out of them. So just something to consider. Thank you much.

Correspondence: My name's Chuck Stephens. I live midway between here and Mazama. I'm a scientist by training, but I spent much of my childhood in the Canadian Rockies, living with outfitters and guides in the backcountry. I probably had 50 to 70 encounters with grizzlies in my lifetime, was charged once by a sow and a cub on the north slope of Alaska. So I feel like I have a long history of living with grizzlies and living with people who live with grizzlies, and there's actually quite a few of them, most of Canada actually.

So I would just like to say that I strongly support the reintroduction of grizzlies into North Cascades. I don't think there's anymore fitting habitat left in the contiguous 48s than in the NCE, and I think alternative C is a good plan for carrying out the Endangered Species Act, which is actually legislated on these gentlemen over here to carry out.

And so you have to ask yourself why they keep coming back. Well, they keep coming back because they are legally obliged to. So with that said, I just want to say that, to acknowledge it, the reintroduction of grizzly bears will add a level of risk to humans, no question about it. However, compared to the other risks that we get from wildlife and many other human-made sources, it's a relatively small risk.

You face a greater risk driving home tonight from deer. You face a greater risk from cougars, if you just look at the statistics. You face a greater risk from the newly reintroduced buffalo. Just look at what happens in Yellowstone. So there are - - you've already accepted many larger risks than this, and I think if you look at the benefits of rebuilding the ecosystem to what the west once was, you'll see that this really is a unique opportunity for us. So let me just make a - - let me not make a (inaudible.)

Correspondence: So first, I'd like to thank the Park Service and the U.S. Fish and Wildlife Service staff for all the time they put into this process. It's been a long process and I think one that's been given a lot of thought.

I live outside Winthrop, and I am in support of bringing back grizzlies to the North Cascades with the 10-J rule. They've lived in this area for thousands of years before humans hunted and trapped them out by the 1960s, and I think it's part of our responsibility to bring them back to this good habitat.

Before living in Methow, I lived in Western Montana, and I spent a lot of time in the woods in grizzly country. And if anything, I didn't feel less safe in the back country there. I got used to carrying bear spray. I was more aware of my surroundings, and - - and I think that's a good thing if you're more aware of your surroundings in the back country.

I do notice living here, I already need to give space to wildlife. Black bears regularly come through next to my house, and if you leave attractants out for them, they'll get into trouble. Cougars I'm sure come by, I just don't see them. And grizzlies are native to the North Cascades, and I think we can make some space here for them even if it involves adjusting our habits some. With so few bears being introduced in such a huge area that they're being introduced into, I think it's quite unlikely that I'll ever see a bear here in the North Cascades in my lifetime. They're only proposing initially putting in 25 bears over a very large area, but I do hope I will see a bear some day. So thank you.

Correspondence: My name's [REDACTED] and I'm going to do something. Most of what I was going to say has mostly been said, but I'd like to have, by show of hands in this room, and you don't have to do this if you don't want to participate. I'd just like to have anybody that's in favor of option A raise their hand if they would please.

It looks like maybe - - I'm just guessing here about half the room. B and C raise your hands. Okay. Can the record reflect we're about 50/50 in the room? Is that a disagreement there? Are we slightly towards A? No, we're not? Okay. I saw from here it looked like 50/50

to me. Maybe it's a little stronger towards option A.

I totally agree with the rancher from Loomis, was it, or over there? He made a lot of the same points I was going to do about grizzly bear habitat. The state of Washington teaches in their hunter safety course that habitat governs whether the animals will be there, and if the habitat's right, the animals will be there.

And according to the research I did today, they say there's around five grizzly bears in this area currently. Is that right, wrong, maybe? I don't know. Anyway, that's research I did today, and it was from U.S. Fish and Wildlife website stuff.

So I'd like to know what these bears are going to eat because today what we're missing are elk, woodland caribou, moose - - there are a few moose - - six or seven runs - - big runs of salmon in the rivers, big horn sheep, mountain goats, and buffalo that were here a hundred years ago that aren't now. Thanks.

Correspondence: Number - - I don't have my glasses - - 165. The last speaker - - and I'm going to add onto this. The last speaker brought a subject up which is - - which is important, and that is what the history that the EIS is using to justify recovery of the grizzly. In fact, the EIS is using documents that date back into the 60s.

So with using documents that are, what, 70 years old, 60, 50, 60 years old, you're not getting the current biology of what's going on in the - - in this area.

Secondly, if you look at the recovery performance

in the zones of Idaho, Wyoming, and Montana, back in 2016, the guru for the federal recovery program - - I don't remember his name. I know you folks know who he is because he - - he had been in that position for, I believe, 35 years.

Back in 2016, he said that those ecosystems have been recovered. They've been fully recovered, and they should be delisted. That was seven years ago. So we have Wyoming and Idaho and Montana all petitioning for the listing, and they've been ignored. They've been refused by the federal government.

So the bears - - Ray Campbell was absolutely correct. The bears are going to be coming down after they wake up from hibernation. They're going to be ornery, hungry. They need to put on weight. They're going to end up in the valleys, and this is going to change everybody's life here.

All you have to do is look at the injury and death rates that are on that table back there on the computer to see what you're being asked to absorb, and it's not fair. And these decisions, by the way, are not being made locally. They're being made by politicians in DC. And I'm a military vet from 52 years ago. There was a time when we were put in harm's way by politicians, but politicians should not be putting our communities in harm's way. That's all I have to say.

Correspondence: I'm 150. Hi. My name's [REDACTED] and I have a home in Chelan that I've had for 20 years. I've spent many days with friends and family and a lot of times by myself in the outdoors around the shores of Lake Chelan, Saheeken (phonetic) here in the Methow, up in the park, and I've seen grizzly bears several times in other states, and every one of those experiences has been awesome and memorable and safe.

I support alternative C, which is returning the bears with the 10-J rule, and I just want to make two points. The first point is there's no question public safety, human safety is of paramount importance. I think with the 10-J rule, we're going to have the protections in place that don't even exist in other areas where there's much larger bear and human populations that have been coexisting safely for decades.

So I think here with the 10-J rule we'll minimize and be able to manage with an effective toolkit of resources and procedures to minimize human and bear conflicts.

So I do think that some of the comments about, you know, bears coming into the valleys and killing people isn't warranted because if that were happening, you'd be seeing news coming out of Jackson Hole and Kalispell, and Bozeman and Sandpoint, Idaho that that's happening, and it's frankly not happening.

There are incidents in the back country. There absolutely are, and that's part of the risk of us enjoying the wilderness.

The last point that I want to make is I feel like as humans, we have this very unique power that's been bestowed upon us.

We're the only species on the planet that can eliminate or preserve all the other living creatures on the earth, and I really think it's important for us to exercise that power constructively in this case.

Human activity eliminated the bears in the North Cascades, and with human activity, we can exercise that power constructively and restore the bears to this wilderness area to make it whole again. So that's why I support alternative C.

Correspondence: Hi. 10-J is a Trojan horse. No action, alternative A is my option. I'm speaking to the problems associated with the 10-J rule. In simple terms, the ESA allows the agency to adopt any rules and regulations they believe are necessary to provide for the conservation of a threatened species.

The ESA Section 9 regulations pertain to threatened species, and do not apply to experimental species. So the 10-J rule contains additional exemption authority that may or may not be necessary and appropriate to protect the designated experimental population.

Under the 10-J designation as nonessential experimental, the agencies are granted more freedom to impose excessive regulatory control associated with endangered species. Why are the agencies, including the 10-J rule now, while back in 2017 it was not included. One of the frequently asked questions of the draft EIS states,

"Wasn't there a previous EIS?" Yes, a previous EIS process began in 2014. Comments provided during that time contributed to the new EIS and to the development of alternatives.

As a result, alternative C would designate grizzly bears in the NCE as a 10-J nonessential experimental population. This is deceitful. While the agencies accepted the public comments from 2017, the EIS, they cleverly added 10-J. They have essentially manipulated the process and are stacking the deck toward their favor, despite the 2019 overwhelming majority of the local population that spoke out and submitted comments against the reintroduction of grizzlies into the NCE.

Furthermore, the 10-J rule is inappropriate application of the ESA and section 10-J policies. The ESA does not provide a rational basis for the introductions of grizzlies into the NCE when the conditions for recovery of the species have already been met.

Correspondence: UNIDENTIFIED SPEAKER:

I am opposed to the reintroduction of grizzlies, or the introduction, whichever it happens to be.

I spoke in 2017, I think it was, in Skagit County and I said that I have two daughters in Alaska. They're in the Anchorage and Eagle River area. Every time I go on a trail, I'm scared to death. Every trail has a sign that tells you what to do if you're attacked by a grizzly or a black bear. With the grizzlies you lie down and protect your neck and try to hold still while they maul you. A park person at that meeting said it's just a matter of education. Well, I didn't agree at the time, and I agree even less now because our son-in-law was killed by a grizzly up there less than a year later. And they didn't know he was missing for about three quarters of a day. They looked for him for 20 hours. They couldn't find him anywhere.

And so finally his cousin said I just feel we need to go down this trail. They went down the trail 50 or 100 feet and, roar, up came a grizzly and attacked the two searchers. The male threw her behind him and took a branch that was still up on a tree and beat the bear in the face with it. He had to beat it off twice, and meanwhile people up on the road were screaming and the bear went away. They never found it, but they did find Michael.

They hired dogs to come look for him, and then he was buried and being used for food. He leaves my daughter and two very small children. My daughter was four months pregnant, and the little girl says, "I wish I had known my daddy."

██████ was a lifelong Alaskan.

People are killed up there when they - - another woman right in Eagle River was killed because she had two canisters of bear spray. Her company dropped her off to be a field worker in a meadow and a predatory black bear came. They - - she used up her bear spray - -
- - used up her bear spray and was killed.

Good evening. My name is ████████ and I'm number 83. I am totally against the grizzly. Now, I'll give you some information. I live down in Birdsvew on Pinelli Road between Sedro and Concrete. I got an acre and a quarter and there's a little subdivision that's on Pinelli Road.

In my yard all the time I've found bear scat, because we've got black bear around there, within five feet of my house. I get elk that come through there. I got coyotes that come through there. We have cougars there. I've got cougars that I got, you know, covers on my chairs and you can see the claw marks where they've clawed through the chairs. They scratch on the trees.

Three neighbors I got, one neighbor across the street, he has horses. A cougar got in there, attacked his horse and they - - the horse knocked down posts. He got away, the cougar left, but that might - - he had to go to a vet, he was all chewed up.

Down the other end of Pinelli, there was a neighbor just a few weeks ago that their horse was killed by a cougar in their pasture. And then down the road a little ways there was a mare that just had a little colt - - this was about a year or so ago. They were - - cougars got in there, came across 20, tried to go after the colt. The mother fought him off and was able to get the cougar to leave, but she was all scratched up.

We've got cougars and bears there. There is obvious that they're doing stuff. You ain't going to stop these grizzlies from doing it. They - - we know in our area the food population for animals in that is gone. I mean, almost depleted. And they're going to come down for your

pets. They might even attack the people. But they're - - they're going to come down. They're going to get hungry. There ain't nothing up in the Cascades enough to keep them fed. And I mean, I see this. I mean, I got - - I see - -

NICOLE SHERBERT:

Thank you, sir. Thank you, sir,
your time is up.

STEVE:

Okay. I see the path and paw prints and everything in my property.

Correspondence: [REDACTED]

Hello, my name is [REDACTED]. In the early 1970s, my dad came back from a hike in the mountains above Stehekin at the upper part of Lake Chelan. And as a young boy, I was interested in nature and wildlife, and I eagerly listened to his story.

He came back, he and his friends, and they said

they thought they saw a grizzly bear. And they weren't sure because the bear was a long ways away and they couldn't have an accurate identification.

But they - - they - - my dad and his friends had seen both black bears and grizzly bears, and they all thought it was a grizzly bear, but we'll never know if it was or not. But I have to tell you, for me, that created a great sense of I want to see a grizzly bear, and I'd like to see a grizzly bear in the North Cascades, so I've got to tell you that's in my heart.

Anyway, not too much long - - not too much time after that, in December of 1973, which is almost exactly 50 years ago, the Endangered Species Act was passed. It was signed into law by President Richard Nixon, and Nixon stated that the legislation provides the federal government with the ability to protect an irreplaceable part of our natural heritage, threatened wildlife. So we made a decision as a nation then to protect threatened wildlife.

And that has been an imperfect tool, but it's one that we've used to try and protect wildlife all across the country. And I know you love wildlife just as much or more as I do, and the question is how can we protect wildlife? How can we live with wildlife?

The grizzly bear was added to the endangered species list in 1975. And that brings us to today. The National Park Service and the Fish and Wildlife Service are leading this effort to protect an irreplaceable part of our natural heritage, and this is not easy. The discussion we're having tonight, among many others, indicates that; this is not easy. You are doing incredibly important work in a very difficult situation, and I hope we can come to some sort of resolution in which we can go forward and protect the grizzly bears of the North Cascades. So - -

Correspondence: [REDACTED]

85. Whoa. Hello, my name is [REDACTED]

[REDACTED]

I should be elk hunting right now, but instead I'm here listening to the insane possibility of reintroduction of an apex predator, the grizzly bear.

I guess I'm kind of confused about the term "reintroduction." If we were reintroducing grizzly bears, wouldn't that mean that they aren't here or ceased to exist in Washington State? If that's the case, why is it that

when I buy a black bear tag, I have to take a bear identification class or test?

My brother just moved to Oldtown, Idaho, which is about 30 minutes north of Spokane. They currently have several sightings a week. I find it hard to believe that the bears get to the Washington border and head the other way. I don't understand why the National Park Service or Fish and Wildlife aim to play God. Obviously, they're making their - - obviously they're making their way here and if the habitat allows it, they will either thrive or die.

I'm not sure if anyone here has ever had a grizzly encounter, but I have and it's downright terrifying. They are man eaters.

When in the woods solo hunting or with my friends

and family where I know there are bears and lions, I'm usually carrying a 44 Magnum or a Smith and Wesson 500. Bear spray is for fools. And Lord willing, if I have another encounter with one here or in another state and I have the draw, if it's me or that bear, I'm going to put as many rounds as I can into that predator's head until it doesn't. If the logic is that they once roamed the North Cascades so - - if the logic is that they once roamed the North Cascades so we should do what we can to bring them back, then I'm pretty sure that before Seattle or Tacoma were once a big city, that they were - - there were coastal grizzlies that roamed those shores, so maybe we should turn a few loose there as well. Might help clean the place up a little bit.

I'm sure Grasspoint Park or Discovery Park or Point Defiance could sustain a bear or two.

Washington State Predator Management is complete garbage. We currently have a dense population of black bears, but yet we were stripped of our spring bear hunt based off of hurt feelings and liberal anti-hunting agenda.

Our lion population is through the roof. I'm not sure what the total number of sightings is, but on this map that I printed off, it's so big you can't even count them.

I think it's safe to say that locals here probably

see them all the time. I know my family does. They prowl our property line, and I know it's a matter of time before they kill one of the sheep that our family eat and raise or one of my pack llamas.

And furthermore, I think that the current predator - - I think that the current predator numbers, we should be working towards reversing initiative 655 which took place in 1966 that ban the use of hounds to pursue and track bears and mountain lions, the most effective and primitive way of managing wildlife. Thank you.

Correspondence: [REDACTED]:

Number 122. Good evening, my name

is [REDACTED]. I'm here with the Washington Farm Bureau this evening. I want to thank the agencies for expand - - expanding the comment periods from two meetings to four, and I appreciate all you coming out this evening.

UNIDENTIFIED SPEAKER:

Raise the microphone.

[REDACTED]:

Sorry, I'm 6'3". All right. Is that better?

UNIDENTIFIED SPEAKER:

Yes.

[REDACTED]:

All right. To keep comments short, Washington Farm Bureau is planning on submitting a written comment before the November 13th deadline, but at the end of the day we're here supporting alternative A, maintaining the current management strategy without reintroduction. Not only do property owners, ranchers and farmers

have the obligation to maintain their natural areas while tending cattle, orchards, et cetera, but they also have the obligation to maintain not just weeds and invasive weeds.

And in the ever shrinking labor pool that we have in agriculture, trying to convince an employee that they're going to be in the presence of a grizzly bear while tending cattle will continue to shrink that labor pool.

Washington is in the top five of the safest agriculture and labor states in the nation. And as agriculturalists and business owners, we understand that we are continually in obligation with the Department of Labor and Industries trying to maintain our businesses as a safe place for our employees. Introducing grizzly bears is going to greatly reduce that stat that we have and that we are very proud of as Washingtonians.

Farmers will be disproportionately impacted as they try to - - if introduction happens, as they try to invest in electric fence to maintain their employees' safety, their cattle station, and their orchard lots.

Pollinators are a great example of those that frequently encounter bears while trying to keep beehives safe through the pollination season, moving them from block to block, et cetera. Frequently, those electric fences are not working.

And there is evidence of electric bear fence in Montana. Unfortunately, those property owners are using that electric fence to try to keep their children safe in

their yards. Thank you.

Correspondence: [REDACTED]:

Hi, I'm 126, [REDACTED]. I

- - I, you know, I found Mr. Striker's comments interesting about Montana and Wyoming regarding interaction with bears.

The population in those two states is under two million.

The population in Washington is pushing eight million. A

lot - - a lot - - much smaller geography to plant bears in.

My - - my position, of course, is A, that we don't

introduce more predators to the state of Washington. We've

seen the - - the wolf populations grow, we've seen the - - the

deer population scatter and things of that nature. The

interaction with people, my wife's a hiker. She likes to

hike the PCT. She likes the 40 miles into Canada, so

obviously she can't carry anything but bear spray. And

quite frankly, the idea of introducing grizzly bears along

that trail, which is basically the center of the - - the

space, terrifies her.

And, you know, I've been to Alaska, I work in

Alaska. So basically what has to happen is people have to

change their habits. So to introduce bears and to have

those types of safe interactions, you have to not do what

you wanted to do.

For example, a friend of mine, I took him to

Alaska. It's the solstice. What do you do at midnight when

it's still daylight? Something you can't normally do, you

go for a hike. And so we go to the first place. We get out

of the car and there's grizzly bear tracks up and down the

river. We go back to the car, drive up to the next place.

We get out. We read this big red sign, bear kill down the

trail, don't go down the trail. We get back into the car.

Thank you.

Correspondence: [REDACTED]:

Hi, my name is [REDACTED] I'm a wildlife biologist and I just wanted to make three points. The documentation says that - - and the suggestion has been made that they're mostly - - mostly herbivorous. They're an omnivore. They are an apex predator. Here, the local population of deer, elk and salmon are in a decline. The population of elk we refer to where I work as the Sauk herd. Last year only had six cows in it, no bulls. And we have no record of them on camera at all this year. When we did the mountain goat flights two months ago, flying all the mountain ranges here in Darrington, we counted 21. So the population already in decline, having an apex predator introduced to it is not going to help the situation.

Number two, we have constant conversations, as I work for a tribe, about recreation and how many recreators are out there. I hiked Lake 22 this last summer, and I was passed by 706 people going up that trail because I'm slow. It's true, I am. I'm slow. And with that many people in the environment with an apex predator, which is essentially their - - the drop off range according to the map provided on page 145 in the documentation, it's 15 miles from the Sauk-Suiattle reservation.

My last point is the Point Elliott Treaty was signed in 1856 - - or 55, 1855. That predates the Endangered Species Act. So all tribal hunting rights apply. And they're rights and they're guaranteed. So introducing this apex predator becomes another huntable species that the tribes have legal rights to hunt. Thank you.

Correspondence: [REDACTED]:

I'm number 92. My name is [REDACTED]
[REDACTED] I live down by Squire Creek. And the last 20 years on my place alone, I've seen wolves, black bear, cougar, bobcat. Every predator we have out there has been in my area. I moved here in '99. In '99 I believe we had 12 logging companies that operated out of Darrington. The forest company shut us down and we have, what, one now. So we kind of migrated to tourism.

This is what no one has talked about. What are you guys going to do when our tourism industry gets shut down? So we know that there will be conflict with the grizzly bears, and they are "endangered". So what does that mean? That means the forest gets shut off to humans because

we cannot cohabitate with the grizzly bears, and they take the priority. You shut the forests down, we might as well just roll up the streets here and move to Seattle. So my question is, if this happens, what are you going to do to sustain Darrington? And this is - - this is the discussion that has to happen because this is where we'll end up going down the road if these grizzly bears are let loose into the - - into the "the federal land", which means like we've had evidence talked about, they will not stay on the federal land. They will go where the food is. And the food is down in the valleys, down where the people live. So that's - - that's my two cents.

Correspondence: [REDACTED]

My name is [REDACTED] (phonetic). My number is 106. I'm 100 percent opposed to this. Most of you individuals know me or have met me at the shop, and I speak for myself and myself alone.

But to give you a little backstory, I actually used to work for a (indiscernible) tribe, and I worked on their salmon restoration work. I can tell you that there was a lot of our money and taxpayers money that went into that, and it was a great thing. However, I can tell you firsthand that if this takes place, you can kiss any of your fishing goodbye.

Now, let's talk about the mountains. You turn around and you do this and you put these grizzly bears up there, not only are you going to push all the black bear, ones that are already there and up in the mountains, you're going to push them down to here.

You turn around and do that, we're going to be losing our animals. You're going to have trash everywhere for a place that's beautiful, and it is going to be 100 percent detrimental across the board. I am not good at speaking publicly and I apologize for that, but I can tell you that this is 100 percent without a doubt the worst thing they could possibly do. If this takes place, we all will regret it. There will be deaths.

Most of us here, we were born and raised in the woods, and we know it. You turn around and with all the public that we get from down below that don't have a clue between a cougar and a pet cat, I'm telling you, they're going to try to go up and pet one of these grizzly bears and you're going to find out the hard way. Nine times out of 10

you kick a black bear in the butt, it'll run away. You do that with a grizzly, they're going to kill you every time. So I'm telling you right now, we cannot let this happen, folks, because if they do this, we're going to have deaths on our hands. And this little town is going to hurt because it's going to hurt the logging as well because they're going to - - anywhere they find a grizzly, they're going to shut it off. We will not be able to log anymore either. So thank you very much and I'm done.

Correspondence: I'm a little bit on the fence on both sides, just so everybody knows. My name's [REDACTED] I'm a resident of Twisp.

Also, I'll just echo what everybody has said, but the one thing I'd like to say to you guys, I think your modeling is wrong. Your bear management unit, you're including high-populated areas like this, and those are problem bears which means that'd be a negative number, not a 02 number.

So I kind of feel like you need to go back to the drawing board on your modeling and look at that again because those bears would be an issue and shot, not a number of 200 that (inaudible.) The lawsuits for the other states that they've been having issues with, that's a problem as well. I think you need to muster up and then have a path forward so that way when it comes time to delisting, you're not twice the number of the estimated population.

And we're apparently having issues with the mule deer populations here locally, if you'd gone to the last meeting that was held. So bringing in a species that would potentially have an impact on that local population, which they're going to be in there feeding in the springtime, and they're dropping a bomb on us. So that'd be a bigger impact on them. That's all I have. Thank you.

Correspondence: [REDACTED]

So 135, [REDACTED] I - - I live and I was working in west Yellowstone for a little bit. When I was there, there was actually quite a few people that got mauled by grizzlies. And then when I left, right on the edge of town when my brother was still there, this lady got mauled by a grizzly too and died.

They're going to come into town. It's inevitable; it's going to happen. And right here in the - - this booklet that you can find online, it even states relocations are less effective and lead to higher mortality rates than, you know, this will bring these animals in. We're also going to - - we're going to get them killed.

So we're going to waste time, effort, money, put ourselves in dangers. Because I know if I see a grizzly

bear and I'm out in the wild, I'm going to shoot it too. So that was just a waste right there of effort and time and money and our tax dollars.

And as the - - as our gun laws get worse here in Washington, in certain areas, you're not allowed to shoot a firearm in the forest. And if you do to protect your life and your children and your family, because that grizzly bear is coming after you, how are you going to be prosecuted? Are you going to have to pay a fine and get imprisoned because you're not even supposed to have a firearm in that area? So how are we going to, you know, what are we going to do? So and then also, what has already been mentioned of the - - of the decline and, you know, the deer and elk population and the salmon population and everything. And - - and so, I don't know, people have ideas and are not really thinking about the greater - - well, they are thinking about the consequences. They're not really thinking about how it's going to affect the people in the town, people's lives. I don't know. All right. I'm done.

139. Hey, everyone, my name is [REDACTED] and I grew up going out to my grandparent's dairy farm out in Chimacum. And I spent my youth kind of falling in love with the natural world, which later inspired me to go back to college and become an environmental scientist, restoration ecologist.

And I think I look at the world and the state that we're in, and it just - - it's really sad to me that our ecosystems aren't functioning as fully and as robust as they could be. I'm a recreationist. I do mountaineering, I do whitewater rafting, I've paddled the Sauk River, and I have livestock. I do have horses. I ride in the back country. And there is a certain amount of risk that I'm willing to take when I'm out there. I know that I can have a slip and a catastrophic fall when I'm climbing a peak like Glacier Peak. I know that I can have one of my animals fall off a steep - - a steep slope. And that that's a risk I'm willing to take because I feel the most human and the most connected with everyone out here when I'm out in the natural world.

And bears are just part of that natural ecosystem and I think that if we can't recognize that bears can - - by protecting and bringing back bears, we can protect so many other parts of the ecosystem. And I know that's not a

popular voice in this room, but I just implore upon everyone that there are risks that we're going to take, and I think to have a fully functioning ecosystem is going to be worth it in the future. So thanks, everyone.

Correspondence: [REDACTED]

Hi, my name is [REDACTED] and I own a couple hundred acres. I also own cattle and pigs. And I kind of back on the - - the wilderness that's between Granite Falls and Oso, you know, there's like, I don't know how many hundreds of square miles. So I have stuff that come out of the woods all the time. I have experience with predators. I've shot my fair share of predators. I've also deterred predators.

But the point I want to make here is in the early '90s I got tired of my job, and I quit. And I do what you do when you quit your job, I went to Africa. And I spent three months guiding a raft on the Zambezi River on the border of Zambia and Zimbabwe. And one night we were pulling up to the side and the people came out and they said, no, no, you can't do that. And I asked why, and they said, well, we lost our donkey. And I said what do you mean you lost donkey? Well, a crocodile came out of the river and grabbed the donkey and pulled it in. And then he says, and my brother was holding onto the donkey, and he went to. And I said, your brother was eaten by a crocodile here? And he says, yeah, last night.

And it was a fundamental change for me, a fundamental difference because that made it clear that our response would be to kill that crocodile. We can't allow that crocodile to, you know, kill somebody right there. And this man was blaming his brother because, I don't know, he didn't like his brother or something, who knows.

But the point is we've proven over and over again that we can destroy every single animal that we don't like. We can get rid of every instance of it. We can make sure that they can't live every place where they used to live. And we are making a choice to tolerate grizzlies, or I'd like - - I'd like us to make the choice to tolerate grizzlies because they won't get a chance to come back if we don't. We've killed too many. That's it.

Correspondence: [REDACTED]:

132. I like to call them out.

Thanks for that. Hey, everybody, my name is [REDACTED].

I'm a hiker, birder, lifelong enjoyer of America's public lands and wildlife. First off, I just want to thank the agencies for being here and taking public comment. I really encourage folks who have questions about this to talk to the agencies. They're experts. They know what they're doing. They've been thinking about this.

Their proposal, the 10J rule, is actually very important. They've described it as alphabet soup, but basically what it means is that any grizzly bears they bring in would not be managed as a threatened species under the Endangered Species Act. They changed the management to a non-essential experimental population. That means there's a map.

It has three different places on the map. Federal lands, that's where they want to see grizzly bears. Non-federal lands, that's like Darrington, and that's where they want to not see grizzly bears. And there are built-in tools into the management plan to move bears out of where they don't want to see them. So if you see bears where they're not supposed to be, they're saying they want to move those bears to where they belong.

I want to talk a little bit about Yellowstone. Since 1979 there have been 118 million visitors to Yellowstone National Park. We talked a lot about how many people live there, not a lot of people but a lot of visitors to Yellowstone, especially compared to the North Cascades. During that time, 44 people were injured by grizzly bears in the park. For all visitors combined, the chance of being injured by grizzly is one injury for every 2.7 million visits. So injuries do happen.

It's the outdoors, like previous speakers have said. They have to be taken seriously. They're terrible events, but most of those injuries are not caused by bears. I'm in support of alternative C. That's the alternative that includes the 10J rule that's the change in management. That rule is important in part because the Canadians may restore bears on their own. And if we don't have a management plan to deal with those bears if they do come in, we'll be in big trouble. So support alternative C. Thanks.

Correspondence: Thank you very much for holding this meeting and giving the public an opportunity to provide comment. I appreciate it.

I'm here to voice my support for alternative C, restoration of the grizzly bears with the 10-J rule. My family is from Montana where the Rocky Mountain grizzly bears have been living for quite some time, and I live in Mazama. My home is surrounded by U.S. Forest Service land and is just 13 miles from the North Cascades National Park. I've lived in the heart of the grizzly bear recovery zone that's being discussed. I believe it's possible to introduce grizzly bears with little impact on the local population and our economy. Communities in the Rocky Mountains have been living alongside the grizzlies for decades, using nonlethal methods and tools to prevent conflicts between people and bears. In Yellowstone at Glacier National Parks, grizzly bears are actively managed to avoid negative interactions with people. Front country and back country tourism is thriving. Our North Cascades stage is set for one of the biggest conservation success stories in the region, if not the country. Restoring the iconic grizzly bear to the Pacific Northwest would be a tremendous step forward for indigenous cultures, our region's conservation ethic, and for the ecology of our wildlands. Thank you.

Correspondence: 87 SPEAKER:
I'm too short. My number is 87, and
I'm listening to all of you here talk about restoring the grizzly or not restoring the grizzly. They're not extinct. At this - - at - - on this date, they're 60,000 grizzly - - wild grizzlies in this country, in North America. And out of that, 30,000 of them live in Alaska and 29,000 of them live in Canada. Those are two of the largest reserve areas where they have more wildlife to be able to roam free there. That leaves 1,000 - - 1,000 grizzlies for the rest. Everybody's talking about Yellowstone and so many thousands of people coming through Yellowstone. Well, they only have maybe 30 or 40, maybe even 50 residents living there. I used to live outside of west Yellowstone - - I mean, east Yellowstone in Cody, Wyoming. We've had wrestlers mauled by grizzlies. We had campers that are pulled from their camps. A woman was pulled - - she was sleeping outside of her tent. She was pulled from her tent by a grizzly and killed. So there is grizzlies here, but they should not be here in the North Cascade. If anybody thinks that they can outrun a grizzly, think again. They can run 35 miles an hour. If you think you can outswim a grizzly, think again. They can swim six miles an hour. The fastest human in - - in the world can only swim three miles an hour. So - - and a Grizzly has a psi of 1,000 - - 1,000 pounds with its jaws. It can rip the head off of a human and eat them within a matter of seconds. So if you - - and it's - - and I'm not talking about what else they can do.

They can - - they can kill animals. They can destroy your fence.

Just today a lady posted that her - - she (inaudible) a grizzly ripping down her shed in her backyard.

After he got it ripped down, he laid down and he was there laying down. That was now his property. If you go out there to try to get him, he weighs about 800 pounds. Let's see somebody take him away. Thank you.

Correspondence Type: Transcript

Correspondence: Number 161. My name's [REDACTED] I'm a resident of Twisp. Just to kind of reemphasize a lot of the statements I've heard already, and I agree with. I want to just make another point.

The habitat is a huge impact, is a huge aspect of this whole discussion. There's a lot of information about past history, how many bears, thousands of years of existence. We don't live in that world anymore. That world does not exist anymore. We've changed it.

There was a large population of mountain caribou in the North Cascades. The east slope of the Cascades was the western boundary of bison. There were big horn sheep with large populations. There were elk. A lot of these bears that are going to be reintroduced from outside areas have that habitat. They have elk, big horn sheep, moose in large populations. That doesn't exist here.

There's been no work to expand those populations before the bear introduction. That's kind of the cart before the horse. You need that habitat. You need that arrangement to sustain that population.

There's three possibilities for these bears. One, they're going to leave because bears have been here occasionally already, and they left. Two, they're going to starve to death. They're going to run out of food. They're not going to put on the fat they need, and you're going to find them in their dens, dead. Three, they're going to eat domestic animals in your backyard. Thank you.

Correspondence Type: Transcript

Correspondence: Number 094, Shawn Yanity, former chair of Snohomish tribe here. I know I said I wouldn't do a public comment, but I'm going to be an idiot and give it here and take my words back. So for - - for this project, I guess, some points for the comment are the management plan needs to - - to have some room in it so that way there is objectives in it like they had in the wolf plan where once the numbers got high enough, they can be hunted.

How are we going to prevent politics from playing into that like they did with the wolves to change it so that way all the people that think, oh, we're going to save the environment by putting all these animals back in. We can give all kinds of examples of Wyoming, Alaska - - I lived in Alaska. I love it.

The difference up there is we seen a grizzly bear, we shot it. We had tags for it. You can hunt them. And all my buddies up there, same thing, they go out to the cabin,

they see a grizzly bear, they shoot it. You don't even have to eat it. If you take it in the springtime, you don't have to eat the meat.

So I think the comparisons - - and if it's being used in our studies by the feds and organizations working with them, you're comparing Alaska, Wyoming, and look how it works there, it can work in Washington. We don't have the habitat. We have a society that is not adjusted to it. We have animals that are already being troubled. You heard it, our mountain goat. I've been involved with the mountain goat relocation with the tribes in the state to help relocation.

We're doing bear studies. There in the north side of Oso, five square miles. We had 500 hair samples and over 100 of those were different bear. And the state's looking at shutting down bear. Five square miles, we have over 100 bears showing up in an area. And so that's the big concern for the tribe is the feds say, oh, it's going to happen. Time's up.

██████████:

And - - but the state takes over management of the wildlife. Now you got politics, you've got all these other things that's going to interfere with other things. And we have - - and you guys have a treaty reserved right to protect our treaty rights: salmon, elk, deer, all the things that sustain our culture. Now, I just want to emphasize that, that these guys will have an impact, just like black bears do and other predators, to our treaty right.

Correspondence: ██████████

Good evening. My name is ██████████ (indiscernible), and I represent our family. We're not the first settlers in this area. Obviously, the Indian tribes have that. But I think we were - - my wife's family was one of the first white settlers in this area in 1890. We still have part of the homestead. And I speak for my extended family. I spoke to them on the phone over the last few days.

And so we're - - we're basically 100 percent against - - we're into option A, and we're 100 percent against - - I call it forest reintroduction. You know, I - - I have no problem with the bears if they work their way down here, not preventing - - preventing them, but they haven't

gone down here so far. We have property over in Okanogan. My son does cruising. He's out in the woods all the time by himself, here and over in Okanogan, way up in the mountains and stuff.

I would ask one question. It's sort of an ethical one. Whoever - - the government hasn't considered this. It's not in any of the reports. Who is liable when I passionately, for our family's sake, we don't need grizzlies. Okay? Some - - eats my son or my dog and I'm going, hey, who's liable? You know, the government is going to say, well, that's just part of nature. You know, you should - - you know, whatever. But when somebody forces something on you that you are not for, you think, hey, if something happens to that, who's liable?

Also, I'm going to - - I've been to many public debate - - I'm kind of a debater. I've been to many public issues. But I want you to question in your report this idea that experts in this and that where they know what they're talking about. Well, I'm an expert in several areas, not in this one. And I'm telling you that everybody that will speak, and every government person will - - has an agenda. And you need to ask yourself, you know, what - - what is - - your going to believe or whatever, because we all have agendas. And if anybody ever says risk-less or 100 percent something, I always question that. Because nothing is 100 percent, nothing is risk-less. If you want to see grizzly bears, go to Alaska.

Correspondence: 97 SPEAKER:

I'm just going to hold this thing. I think everybody in here has a lot of emotional stuff at stake. They're invested in it emotionally on one side or the other. For myself, I would like to see things be the way they were 200 years ago. I would like to see old growth forest here. I'd like to see streams teeming with salmon. I'd like to see the forest full of deer and elk. I'd like to see the habitat that was once here.

Unfortunately, though, that's not reality. So if I try to put something in here that's not supported by habitat, the habitat no longer exists. I'm creating conflict. I'm creating failure. I'm creating emotional issues with other peoples that have economic - - local economics are extinct, their livelihoods are extinct. I'm creating conflict with peoples that like to recreate. I'm

creating conflict with peoples that want to go into the woods and gather berries.

Now, we can see by this little dialog here from everybody that's testified that this doesn't make sense. A plus B equals C, and it really doesn't matter how you feel about it. Everybody here knows it doesn't make sense. So when you see a situation being promoted, being pushed over and over and over again that doesn't make sense, again, you have to ask yourself, what - - what's the agenda here? What actually are we trying to achieve?

We can't restore it. The old growth is gone, folks. The rivers teeming with salmon are gone, folks. The population that is here now, multiple times bigger than what it was when they were grizzly in this area. It's an emotional thing. I would like to see that. I would like to also believe in Santa Claus, but it's not reality.

Correspondence: Good thing I'm a shortstop.

I don't - - I don't know where to start unpacking this. I - - first of all, let me just say I support alternative C. My name is Gerald. I support alternative C because of the 10J rule and - - and how it encourages social acceptance of an animal like grizzly bears.

It - - it gives managers a lot of flexibility to deal with the issues that folks in here are concerned about.

But the death and destruction isn't borne out by the data.

I understand people's concerns. I think fears are real.

Nobody here is saying, certainly not me, that there will be no conflicts with grizzly bears.

But let me just give you a couple of examples. And

I apologize for using the Yellowstone example again, but it's - - it's a good one because we have a lot of data from - - from the ecosystem and from the park.

So the 2021 4.9 million visitors contributing \$534 million and roughly 8,700 local jobs in Yellowstone National Park, a place with almost 1,100 grizzly bears. Numbers we'll never see in this part of the world.

This isn't Yellowstone, I'll admit it. But in part, people go to that park because of the wildlife, because of the bears, because of the wolves, and they hike and they fish and they camp. Yellowstone ecosystem is the same size as the North Cascades Park, as the North Cascades Ecosystem, a little less than 10,000 square miles. We have

the big brains. We can coexist with these animals, it's been proven in so many places. Thank you.

Correspondence: 113 SPEAKER:

113. This plan totally disregards the safety and wellbeing of our state's most vulnerable population. What you're asking many of the counties lowest income residents to do is not feasible and not realistic. Eighty percent of the Marblemount population earns \$31,000 annually, which is barely above the poverty line. And the average cost of an electric fence around a one acre property ranges between one and \$4,000. We've consistently been told to install electric fences as the best option to protect our property, livestock, and children. Yet there is no funding or assistance marked to aid the gateway communities in bear awareness. You are signing these up - - these bears up for a death sentence as soon as the salmon start running. Being fully realistic, you all are lying to yourselves if you think the locals aren't going to kill a grizzly that comes onto their property. Furthermore, you're delusional if you think a local is going to report a wayward grizzly, much less one that's been taken. We all know no one is coming all the way up river to deal with it. I've read the entire plan and the impact statement as well as attending last night's meeting in Newhelam. As a Marblemount local, I felt it is my duty to do my due diligence on this matter before I formed an opinion. Last night I heard the conservation groups support reintroduction and tried to maintain an open mind while hearing from those who do not live in the gateway communities and never have. Again, there's a certain element of reality that's missing. As someone who lives in Marblemount because I spend so much time in the backcountry, I think it's rich to brush aside the concerns of the locals as so many of those groups blatantly did. And while it's really cute that the Audubon Society and Sierra Club feel the need to comment on this, I urge the National Park Service and Fish and Wildlife Service to be realistic. In conclusion, the amount of outreach and support to the gateway communities is abysmally lacking and I urge you to factor in supporting some of our state's most vulnerable population members and their safety. Thank you.

Correspondence: [REDACTED]

Good evening. I'm Senator [REDACTED]

[REDACTED] I'm here tonight with my - - one of my seatmates, representative [REDACTED] and thanks for all your testimony. I want to read from an RCW. The RCW says grizzly bears shall not be transplanted or introduced into the state. Only grizzly bears that are native to Washington state may be utilized by the department for management programs. So how are they getting around that? Well, they're saying it's federal land. I think that is disingenuous and disrespectful to our state. And I think it's our Fish and Wildlife's responsibility to not support this also because they are directed in here to follow our laws.

One of the members up here said politicians have an agenda. We do. We have an agenda, and that is to represent our constituents. And the number one thing in that duty is to keep you safe. My mother lives up on a hill above Hamilton all by herself in the woods off grid. I would not feel safe if there were grizzlies coming down. Now, we've all seen Jurassic Park, right? They don't stay where you put them. Not even when you fence them in or fence them out.

So another gentleman said follow the money. You're right. Follow the money. We can't affect that here in Washington state. But this has been stopped before, twice. The last time it was stopped, it was by representative Congressman Dan Newhouse. Dan Newhouse isn't new even from this congressional district, but he knew enough to take away the funding. Write your congressman or congress women and do not let them fund this program, and it will go away.

Thank you.

Correspondence: [REDACTED]:

All right. Well, I'll follow that. So I am [REDACTED]. I am a full-time resident of Marblemount. We just moved here four years ago with our children. We have seven children. Okay? Last year, I was eight months pregnant coming home from a doctor's appointment and there was a black bear rummaging around my

entire yard.

My husband and our other children came out banging pots to get the bear away from the car so I could come in my house. Bringing grizzlies into the area where we don't have a balanced predator prey population is not going to make our ecosystem better or more balanced; it's going to throw it out of balance even more.

If we had a balanced prey, grizzlies could be here and we could still be here and be safe. We're not - - bringing a more aggressive bear into our community when we can't handle the black bears we already have is not going to make the situation better. You can't balance something by putting more weight on the already overweighted side.

Correspondence| [REDACTED]

My name is [REDACTED] (indiscernible).

We moved into the area in 1991. We've been in the state since '86. We've raised our family here. We've seen predators on our acreage, including losing pets to them. I also teach young people wilderness travel and take them into the Cascades several times a month year round. I've seen all the wildlife.

And I've read the impact statements and read the introductory materials anyway, and I don't see any compelling reason why we should introduce an apex predator into an area that's now a relatively high human population and hasn't had them for over a century. Why are they spending a lot of our taxpayer money to bring predators into an area where they haven't been for over a century?

I can assure you there's nothing living in the Cascades that remembers there were grizzly bears here at one time. I have no problem with the first option, alternative A, to protect the few we have. The other thing that strikes me that biologists seem to mess up - - by the way, my sister is a biologist who worked for the federal government on land management, so I know how they operate.

But bears, like a lot of predators, are territorial. You introduce foreign bears into the tiny population of indigenous grizzly bears, it seems to me they're not going to integrate nicely and get along and say Kumbaya. They're probably going to fight.

There's a high risk, it seems to me, that you would decimate the tiny population of native bears by introducing foreign bears into the ecosystem here. And I can't see why grizzly bears have to be in the ecosystem when

we have lots of black bears. What is it that grizzly bears provide that black bears don't, which aren't particularly dangerous?

Correspondence: [REDACTED]:

Hi. Thanks for the chance to speak and thank you to the agencies for hosting this meeting. My name is [REDACTED]. I'm going to be here supporting alternative C with the 10J rule. And I spend a lot of time in the backcountry in the North Cascades. I live in Whatcom County. Days and weeks sometimes by myself far into the back country. And I love seeing wildlife out there. It's some of my most meaningful experiences that I've had in this place that I know we all care about. And just this summer, not in the North Cascades, but in another ecosystem, I spent maybe 10 minutes watching a wild grizzly bear and it was incredible, majestic, inspiring. And so what - - I want to make two points. The first one is that I think what we're not talking about right now are some of these positive experiences that we could be missing out on if we don't - - if we allow the species to disappear from this area. And I hope for my family and future generations that they have the opportunity to experience that joy. And then the second point I want to make is that

anyone supporting the idea of recovering grizzly bears in this region would have, as a highest priority, safety of people who live here. It's absolutely critical to the success of something like this. And I might - - that might not be a popular opinion here, but it is my opinion. I think that's why the 10J rule is so important. If you look at it, it has matrices of what actions will be taken if certain things happen. And so many of the like dreadful things people are talking about here would be things that would be the highest priorities to prevent. So I encourage you to take a look at that rule and what it says and the ways that it would be in place to protect you and that you could use it if you felt threatened by something like this. So thank you for hearing my opinion and I hope you have a wonderful night.

Correspondence: [REDACTED]

Hi, I'm [REDACTED] and I grew up in Skagit and Snohomish County. I recreate out in the woods every week with my wife and kids and family. And I've - - I've done that - - I've recreated my whole life locally. And I very much appreciate that I'm able to do that without the risk of being attacked by a grizzly bear.

I think it would be really an unfortunate thing if my kids had to grow up with the risk of going out in the woods and being attacked by a grizzly. I know a lot of people here have - - that are for it have very good intentions. But just the reality, I don't think, you know, that doesn't do a lot of good if - - if you're one of the unlucky ones that gets attacked, so.

One other point I want to make is I see a lot - - I read a lot of articles that kind of - - news articles that make it sound like the grizzlies disappearing from our forests are a relatively recent thing. I'm 49 years old, and I'm sure there's people here a lot older than me, but - - that can attest to this. But I've never seen a grizzly in the woods and I don't think they went extinct - - extinct in my lifetime locally.

My dad's a retired land surveyor and worked for the timber companies, and we discussed this issue of the grizzly bears. He studied many US geological survey - - surveyor field notes as part of his work and he said - - he mentions that he's never seen mention of land surveyors seeing grizzly bears locally on any of the - - on any of the field notes that he's studied.

So I don't know, you know, when - - when grizzlies went extinct locally. But I don't - - if this was such a great habitat, I think they would - - they would be coming back. So that's all I got.

It's a lot smaller crowd

now. I know everybody here. I get what you're saying on the grizzly bear act. I am actually not against the grizzly bear act. What I'm against is what our state has done for our fish, for elk and deer, and the fact that we are retracting with more punishment every year from that.

I would love to see grizzly bears here one day.

The problem is we don't have the sustainability. One day we will maybe, but until we can resolve our fishing issues we have here, the elk herds that are going down every year, and every year, soon enough, we're going to be drawing for elk tags because of our populations dropping. We can't resolve that with our current issues.

We go out in the mountains every day. I go hiking with my family and I go hunting. I see elk, I see mountain lions, I'm aware of all those things. We can adapt to those things. But the grizzly bear is not going to survive here, not until we can sustain our habitat. And the fact that we are talking about this right now is ridiculous. Until we talk about the herd problems that we have right now and our animal situation we already have with predators, I'm not willing to do this until that is a result. Thank you.

Correspondence: Okay, 159. And (inaudible) County Commissioner for this district. So the county commissioners are formally opposed to re-introduction of the grizzly into the North Cascades. Everybody can go online and see - - get a - - see our letter that we've sent.

On a personal note, we are not a state that manages by common sense. We're a state that manages through litigation. So just recently the Department of Fish and Wildlife - - State Department of Fish and Wildlife, the commissioners were presented a scientific data that said that their spring grizzly bear, or sorry, spring black bear season should continue. Commissioners have decided not to take into account that scientific data and - - and did away with the spring bear season.

So obviously, management by best field of science is not something that we're very good at. The 10-J - - there is a 10-J rule

on wolves in Washington State. It is east of Highway 97, so it splits Okanogan County, right down the middle. That 10-J rule has tools in the toolbox that we can use, that the state can use to actually manage wolves, and is litigated constantly on the actions that the Department of Fish and Wildlife takes in order to use those tools.

I got 30 seconds. So - - so personally, you know, I'm opposed to this because we do not manage on a basis of common sense or best available science. We manage based on the most money thrown at litigation to make sure that their point is heard the loudest and that their position is taken. So that's it. Thanks.

Correspondence: 178. My name's [REDACTED] live in Carlton. Like some other people, I was really conflicted on whether I had anything to say tonight. I'm still conflicted about even really what my authentic opinion is on this. So you might wonder why in the heck I'm up here, but I think this is a great - - great discussion to have in our community.

I have no objection per se to grizzly bears on the landscape, but I do at this moment in time think that I favor option A for a number of reasons. One is just my understanding of the human race. I think we - - we're a very active species. We're really good at messing things up. We're not very good at stepping back and - - and letting things take care of themselves. And this is I think a situation where we can benefit from that.

Financially, this is going to be an expensive proposition, and there's a heck of a lot of things to spend money on locally, nationally, globally, and there's only so much to go around.

My preference would be to invest in the species, the habitat that are existing here. There's a lot of wildlife concerns that - - that exist, a lot of species that need our assistance. And we should double down on what's here before branching out into new realms.

The timing of this I do question as well. We're so divided in our country, and do we need to pick every battle on every front at every moment? I feel like not. I feel like these are times for a pause. And that would be my preference in this - - in this situation. Thank you.

Correspondence: UNIDENTIFIED SPEAKER:

I think I'm the last one. I

grabbed a ticket out there and then I lost the thing before I could get up here and speak. I opened up and listened to everybody's comments. And I just wanted to say in my opening I forgot to mention that in the first contact, our tribe up here had over 8,000 people.

And I've told this to the gentleman sitting over there at previous meetings we've been at, now we number just over 300 and that we are more endangered than that grizzly you're trying to save. And I focus that towards the people that want to save that grizzly, is that we are going extinct and these bears might help us go extinct if they run into a group of us going over to Stehekin or something on our annual trip we do.

So I just wanted to say that. I forgot to say that in the opening. And I guess I'm closing.

So thank you everybody, appreciate the support.

Hopefully we can come to a good conclusion. I would guess that we support option A in the paperwork I handed you, it says, you know, to take no action, is what we stated in that. So that's all I have to say, and thank you.

Okay. So I would - - first

I think it's section A, propose supporting that where they continue with the management as it is, without introduction.

And my additional concern, besides other comments people are making, is that as a forest service wilderness worker, I am afraid it's an unfunded mandate where the actual agencies that work managing the wilderness, managing the recreation areas will not have the money and resources to respond to all the extra needs that would come from having introduction of grizzly bears.

Okay. That's it. Thank you.

Correspondence: Okay. So I live about one minute drive south of the reservation land, about five minutes north of town. I live on a property that has bees, rabbits, poultry of all kinds, waterfowl of all kinds, cats, dogs, and three children under the age of eight.

We have already had black and grizzly bears on the property this year. We have already had a cougar on the property this year. My neighbor lost a dog to a cougar. My other neighbor lost several cats. He feels like he's just feeding cats to the birds and cougars at this point, but...

I know that with all the comments that have been made tonight about the sustainability of the food sources in the valley, the wild food sources, the salmon, the berries, the elk, the deer, there is not enough to go around for the grizzlies if they're introduced. There are already native bears, black and brown, here. And they are already down in the valley where humans are because there's not enough food for them from natural sources already.

And I don't have enough money to contain eight acres against bears and I - - I certainly - - I don't have the mental bandwidth to spend every waking moment worried about

what predator is around the corner trying to - - to harm my livelihood or - - or endanger the lives of my nieces who - - who live there.

I - - I just - - I can't see how anyone responsible and with a shred of common sense could look at the numbers of - - of predators that we have and the numbers of prey items that we have, which I know we have the ability to survey from the air, and - - and think that it would be a good idea to add to those predator numbers.

And I just worry about the people in my life and the people around me who I don't even know having human on bear interactions, because it never works well for the human. And a lot of times it doesn't work well for the bear either. And I - - it feels like because of how willing the people here are to shoot those bears and how, I would say unavoidable the interactions will be, it will be just like feeding bears into a chipper shredder.

We're just relocating them from somewhere where they were living happily to a place where they will die because they won't have an option but to interact with humans to find food. And those humans have no compunction about killing them. That's the end of my comment. Thank you.

All right. My name is [REDACTED]

some questions I had for the entities who are trying to push this. I'm just wondering what benefit adding grizzly bears is going to be to our ecosystem. It's been - - we've been struggling with the commission right now to get our spring black bear hunting back. We've had issues with lion hunting as well. People are constantly trying to take that from us. So I'm concerned with introducing grizzlies, we're not going to have opportunities to maintain them and they're just kind of kind of get out of hand and, you know, what's going to happen if we do have grizzlies in areas that they shouldn't be? Relocating them hasn't been proven to work. And we're also concerned about our logging here in this city. It would be detrimental to our town especially. That's about it.

Correspondence: UNIDENTIFIED SPEAKER:

So I am a proponent of alternative C. I believe the 10J rule will be a very effective tool for the forest service and the National Park Service to effectively manage bears and track and maintain their habitat where they're released into the upper ranges of the North Cascades, which is a very remote location. I think there's plenty of evidence from other areas in the grizzly recovery plan over the last 30 years, particularly in the Yellowstone region and the Glacier Park region, that people can live safely and coexist safely with bears. And we've also seen statistically boosts both in the number of visitors to those parks with the presence of grizzly bears, and I would include Grand Teton National Park as well.

So the Teton, Yellowstone, Glacier Park regions have all been in the top 10 of national park visitors consistently, and there's a very positive beneficial economic effect to the neighboring communities with the presence of bears.

But the most important thing is from a safety perspective, even with all those visitors and the growing population of bears, it has been safe for humans to recreate, to have ranches and farms, and to enjoy the back country even in those regions even with the presence of grizzly bears. So I support alternative C. You're pretty amazing if you can catch all that.

Correspondence: UNIDENTIFIED SPEAKER:

I have lots of grandkids and kids and friends that hike in the mountains and I'm worried about their safety if the grizzly bears are introduced. And like many people said, they don't stay where they're supposed to, you know, they go where the food is easy.

And I have a son-in-law that works for the park service, and he goes up to stay Stehekin and fixes the water up there. And he won't be able to take a gun or anything with him because he has to go into Canada to get there. So

I'm - - I'm for A. I don't want grizzly bears to come in.

He can't take a gun to Stehekin and I don't know
if he can even take a gun in the - - in a park truck or not.
But he will have no way to protect himself from grizzly
bears up there. That's it.

Correspondence ID: 14574Project:112008Document:132104

Received: Nov,02 2023

Correspondence Type:Transcript

Correspondence: So I think it is very - -
it's very sad that three quarters of the recovery area is
administered by the forest service and no one from the
forest service is here to listen to comments tonight.
There are some huge issues involved with how we
actually manage if the bears are brought in with food
storage, with potential trail closures and the - - I don't
think that the EIS does a very good job of looking at the -
- all of the broad activities that occur on the - - on the
forest. It's very park centric and there's far more use
that occurs in the national forest wilderness area
surrounding and the national forest as a whole than there is
in the park.

One example I have is for - - we're trying to do
some things with food storage involving camping here, food
storage here, cooking over here. And as soon as we start
doing that, you're basically establishing a developed site
back in the wilderness someplace where people are going to
camp. They're going to cook here and they're going to store
their food over here.

And when that happens, all of the sudden the
agency becomes responsible for managing hazard trees. And
there's hundreds and hundreds - - there's thousands of
campsites in the recovery area compared to in the park where
they tend to be isolated in certain - - certain spots. And I
think that that's a huge issue and the staffing to implement
any of this is - - is negligible.

So in closing, I support alternative A with 10J
attached to it. So I would like to see the agencies
actually work with the Canadians. And if the Canadians can
get bears, which I understand they're working on, to get
south of Highway 3 in Canada to be established north of the
border, and they happen to start wandering in, I'm
absolutely fine with that. So that's the alternative I
would propose is alternative A with 10J attached to it when
bears eventually migrate south, as I think they will.

No action. We have the alternatives down here. As a former county commissioner, we see a lot of failure going on with studies. For example, remember we had lots of stuff to (inaudible.) We lost some firefighters because of the Endangered Species Act on faith. I've got memories there.

I have an orchard. And you know what? There are bear in it. Do I get reimbursed anything, the tearing of the trees down and that? No. I know of a bear orchard down in the valley. They have black bear right now in it. Well, they've had black bear in it, five of them plus the other ones. They're not reimbursed.

We are a - - Okanogan County is a farming, rural community. And in the testimony you can tell which side we're on because the farmers are opposed. In fact, we all determined it. I want to give you three Fs.

First of all, fire. Fire changes a habitat. At one time when I snowmobiled from Carlson to Brewster, there was berry brush that high. Everything is gone. Those bears will come into my orchard.

Second F is frost or freeze. When I've seen it 60 below, I've seen a lot of our habitat go by the wayside. I've seen it 60 below here. And we go onto the other alternatives. When I was commissioner, that's all I heard. "██████████ if you vote for that, do you know what the policy is?" I know what the policy is. Okay. The policy is the three Ss, shoot, shovel, and shut up (audio disruption.) But one other thing I did want to say is I resent the cameras along our trails and our forests. I get a (inaudible) following me.

Correspondence: That's a hard act to follow. So my name is ██████████ This is the fifth time that I'm speaking on this issue, three while I served as the state senator for the 12th legislative district representing this area, and twice since I've been retired.

I support Alternative A because probably it just seems like no matter how many times we speak to this issue, it just doesn't go away. We have increased population now. We are much bigger in Washington State than Idaho, than Wyoming and Montana. I am fourth generation from Lake Chelan. My grandfather came in 1899. He loaded the wood - - the original wood in the lake. He didn't talk about grizzly bears. He talked about rattlesnakes and black bears. We have black bears.

Has the study done on if these grizzlies come in, how are they going to interact in the same habitat with the black bears? I just think a lot more work has to be done. My dad was a member of the Lake Chelan Sportsman's Group. They worked long and hard to get a fishery on Lake Chelan. If there are bear in the Skowhegan area, where are they going to go? They're going to go to the river, and they're going to eat the kokanee.

This doesn't make sense, but I'm trying to figure out because sometimes I feel like no matter what, the agencies are going to do what they want. So will there be another chance at the end when a final decision is made? Could they not have as many as they're talking about? Maybe try five? There must be an alternative where we can come together and stop this because it's been going on too long.

Correspondence Type: Transcript

Correspondence: Excuse me. Hello, Winthrop. My name's ██████████ and I'm here to support the grizzly bear restoration alternative C, on behalf of the National Park's Conservation Association and it's 1.6 million members and supporters.

NPCA is a nonprofit organization. We advocate for America's national parks, our park service by tagging the places to be

maintained in an absolutely unimpaired form for the use of future generations, as well as those in our time.

After attending all four meetings on North Cascade's Grizzly Restoration, I've heard a common refrain. We've lost so much wildlife in this area and lost so much habitat, we can't restore it. We shouldn't even bother trying. It's gone, according to some.

I hear this message, and I feel the sadness behind it. I know that we're facing many environmental challenges, but despite these challenges, I believe nature, like our bodies, wants to heal, and we can let it heal. We must not give up on nature, its wildlife, or the beings that cannot have a voice in this process. Our fate is inextricably linked to theirs.

We're seeing species like wolverine bounce back. The fish in the lakes are being successfully reintroduced. And I believe that if we take the right steps, "Free the Snake River," we can see salmon rebound too. If there was no habitat here, there wouldn't be black bears here. Grizzly bears and black bears eat a lot of the same things.

So at the end of the day, we have a choice, to share the land with the grizzly or not. We can take it for ourselves, for our needs, for our convenience, and that's a choice we can make. We can also choose to make room for the grizzly.

Americans had the forethought to protect thousands of square miles of habitat. Wilderness in contrast with those areas where man and his works dominate the landscape is recognized as an area where the earth and its community of life are untrampled by man, where man himself is a visitor who does not remain.

It is in this place and for this place that the grizzly bear must be allowed to roam. Its presence attribute to our continued commitment to allow nature, natural systems, and wildlife to have a place to fully exist and thrive.

Correspondence Type: Transcript

Correspondence: Hi, everybody. I'm [REDACTED] I'm a resident of both Whatcom and Chelan Counties. I'm co-chair of the Washington Sierra Club Wildlife Committee. I grew up in Eastern Washington, in a hunting family. I spent summers in a primitive cabin about 20 miles out of Chelan with a two-seater outhouse and outside running water. I know what it's like to be out in nature.

I regularly hike on both sides of the North Cascades and fully support grizzly restoration in the North Cascades ecosystem. Both the National Sierra Club of 3.7 million members and supporters and the Washington chapter this year with over 100,000 members and supporters, support grizzly restoration.

With over 9,800 square miles, the North Cascade's ecosystem is larger than Glacier National Park, Yellowstone National Park, and Mammoth National Park combined, all areas where grizzlies coexist. Grizzlies will be started from small numbers each year. They'll repopulate slowly, and will be in very remote areas. Although I hike regularly, I'll probably never be fortunate enough to see one.

Contrary to fears, grizzlies don't prefer livestock. They mostly commonly prefer fleshy roots, fruits, berries, grasses, and herbs, and sometimes rodents, fish, and ungulates. As a psychologist, I understand the element of fear and the unknown.

However, the risk of a grizzly bear attack on a human is infinitely smaller than other risks we encounter daily.

The risk of a grizzly attack in one's lifetime is 2.1 million to one. The risk of dying due to guns, 1 in 89. The risk of dying from a motor vehicle crash, 1 in 93. The risk of dying from a dog attack, 1 in 53,483.

To prepare for grizzly restoration though, we need to prepare now. This summer the North Cascades National Park had significant problems with food and garbage that served as bear attractants. Artist Point in Whatcom County and other national North Cascades rescue programs have overflowing - - we're done? I saw the yellow. I didn't know. So I really support that we take bear safe practices seriously, and the Forrest Service and the National Parks need to do that. Thank you.

Correspondence: Hi, everyone. My name is [REDACTED] (phonetic.) I live down in Puget Sound. They didn't have one of these meetings in my community, so I hope you don't mind me coming here to speak.

This is my first time in Winthrop and in North Cascades National Park, and it was breathtaking, the drive up here. I've lived in Washington for three years, but before that, I lived down, and actually from Philadelphia. And the most interesting piece of wildlife you can see in Philadelphia is a pigeon or an (inaudible) depending on, you know, the circumstances.

I work for Defenders of Wildlife. We're a nonprofit that focuses exclusively on restoring endangered species, and I thought about all the scientific points, process points I could bring up here, but the truth is we all make our decisions based on emotions.

So I'm here to tell you there is - - that I would like my descendants, my future generations to be able to see the wilderness that you have here and how precious it is. You know it's precious. You live here. You've seen it every day. Grizzly bears are the last missing mammal from this landscape. And I hear someone back there ask, you know, what is - - is the cost of a grizzly bear versus a human life?

Well, there were thousands of them, and we hunted them down to extinction. I don't think anyone should die, but I spend my life, and my colleagues spend their life driving around this state working with people like you to talk about electric fencing, securing attractants, ways that we can coexist with these bears. So I just ask that you consider it, and we're in support of alternative C. Thank you.

Correspondence: Hi. My name's [REDACTED] and I'm 164. I

represent the North Cascade's Conservation Council. I live down the street here.

As all of us here, I'd imagine, would know the wild west is no place for wimps. And I believe we have the strength and the wisdom to live with grizzly bears. Now, what this plan to reintroduce grizzlies is doing, it's admitting a mistake that our forebearers made. And that mistake was that if you find some species of wildlife inconvenient, you just kill it off.

We're amending that mistake by reintroducing the bears, and that's why I support alternative B. I don't support C. I support B. my organization supports B because we don't want the option of making that same mistake again where we just kill everything that's an inconvenience to us.

Now, a word about litigation. I have great respect for esteemed commissioner who I bought a lot of lumber from. But litigation, folks, is not something that anybody enjoys doing. It's a very expensive, time-consuming process. But litigation is what gives us as Americans the right to challenge our federal government. We're a nation of laws, and we have the right to enforce those laws. Nobody likes to live in (inaudible.)

I want to make a couple of comments about livestock conflicts. Just as a point of - - a point of reference from EIS, that is that I believe that the preferred alternative at least needs to have a provision where if livestock are killed by a bear in an open range situation, that's not open to lethal means. If it's killed on a private land and it contained livestock operation, that would be fine in my opinion.

I have a lot of respect for ranchers. They're good, honest, hardworking people, but we need to learn to live with wildlife again, all of it. Thank you.

Correspondence: : My name's [REDACTED] (phonetic.) I've worked for the Forest Service for about 30 years here in

Winthrop. First time - - I used to do geographical information work. The first time I knew that grizzly bears were anywhere near our community was in 2015 when they started coming across many parts of Canada, the first official time I've heard that they come into the community. And that is less than 50 miles from downtown Winthrop.

With the introduction of grizzly bears, as the population increases, what's going to happen is our recreational areas are going to change because we're going to have to put electric fences around the campgrounds to prevent the grizzly bears going in there.

My experience with that is a camp in Alberta. We were camping there. Those are things they have to do. All the households in downtown can or have to have bearproof garbage cans so that the bears will not have nuisance - - or not be a nuisance coming and taking your trash and stuff, which would mean more - - more interaction with people. California and Oregon both have eliminated the reintroduction of grizzly bears because of human safety, animals, and range-type animals. So why are we doing this again? Thank you.

Correspondence: Hi. My name is [REDACTED] I live about five miles out of town, here in Winthrop. And I just thought I'd mention - - something we encountered a couple of years ago is there was a brown bear getting into our garbage in our neighborhood, and I can't imagine what that would be like if it were a grizzly doing that. I never saw them, but I saw the effects and got to pick up all the garbage, but that's a small issue. I have some facts here that I thought I'd mention. So these are facts.

Grizzly bears will not remain in the park. Another fact, the EIS fails to address the consequences resulting from grizzly to human conflicts, human deaths and injuries. Another fact, in similar recovery zones, the majority of grizzly to human conflicts, deaths, and injuries occur on private lands.

Another fact, the previous director of U.S. Fish and Wildlife Services stated before congress that the grizzly is biologically recovered. Another fact, empty bear spray - - bear spray cannisters have been found next to the dead bodies of those killed by grizzlies. Another fact, neither the federal government or the WDFW have an exit plan to withdraw the insertion of grizzly bears into our communities, once the action is executed.

And another fact, this is from the National Park Service. Written policy states the safety and the health of employees, contractors, volunteers, and the public are core service values. Above all, keep in mind that the safeguarding of human life must not be compromised. Thank you.

Correspondence: Thank you. I spoke over in the Omak area. I'm for A, but I wanted to make sure that everyone knew I - - I misspoke on one of the acts, the Coordination Act. That's mainly for BLM, but there is acts for that say there has to be coordination between all the different government agencies, so there are multiple things.

That coordination means they get to, or have to come to us, i.e., the state, the local government, the commissioners, and everybody has - - we get to see all of the data that they have there. Will we get it all? Probably not, but it's a federal thing. And besides that, the other side of that is it was brought to my attention, I made a threat which was not a threat. We have an RCW that says there will be no grizzlies introduced into the state of Washington. That's the RCW. That falls under our RCW. If there's a grizzly that's introduced into the Okanogan County, that's the one thing I said last time also, my only concern is Okanogan County, because I am your sheriff, and I will protect everybody, whether they come in or come out and they're allowed to. My number one job is to protect all persons and the wildlife. If they're allowed to come in, we don't shoot them unless, you know, something's going on. But I'm telling you the other side of that is, if they're introduced, the RCW has not been changed. Federal government doesn't go to litigation on it. As the commissioner said, everything's litigation, because the - - I can't remember the word, but that's all right.

The federal government could overstate, override the state on certain laws, but that's only constitutional laws. Animals do not fall under the constitution. Maybe with the Endangered Species Act or something like that. That might be another way of entering into that.

But what - - what I will say is if there's a bear threatening a human, I will shoot that bear. Okay. I do not care. I will go forward. I will fight that fight within federal court. You are my number one reason to be here.

Correspondence: [REDACTED] (phonetic) I'm 189. I'm in opposition to the bears. I've lived here only 32 years. I haven't seen any bears, but I'm an avid hunter, fisherman. And I can obviously see that the U.S. Fish and Wildlife and the local State Fish and Wildlife has not managed the existing data we have, as we have a dying mule deer population, pretty much no elk, very few moose, goats, any other species here. So why would I believe that they're going to manage the grizzly bears? I would say no.

I was just recently in Alaska on a moose hunt with a guy that actually - - a guy that's for grizzly bears. He carried a 454 on his chest at all times. This is the guy that's with bears that's shot all the time. He knows whether they would get him or not, and he carries a 454 with him at all times. If we're all prepared to do that, bring them on in, and I guess we can protect ourselves. Otherwise, the food they will be eating will be the hikers, the bikers, and the skiers. So if you guys want to become the food, that's fine. But I'm in opposition to bringing them in.

Correspondence: Hi. My name is [REDACTED]. My family has been in Methow since the late 60s. We - - we are still here. I have an alfalfa field. It is full of mule deer. So anyway, getting to the grizzlies. I know where they're going to come to drink. It's my property because there's a creek there. I know where they're going to come to eat, at my apples, at my field, and where I am successfully providing habitat for mule deer.

Right here I have a list of 12 people who have been attacked by grizzlies since July 2023. I wonder why this hasn't come up tonight and how that plans to be addressed. I as a woman am not in the habit of having a high-powered rifle on me when I go and do my gardening, tend my apple trees, or feed my chickens. I am not in the habit of carrying a high-power rifle with me to go check my mailbox which is right beside the creek where they will find water. Thank you.

Correspondence: Re: Comment in favor of Draft Grizzly Bear Restoration Plan - North Cascades Ecosystem, Washington

Dear Superintendent Striker:

I am writing to express my support for the federal restoration of grizzly bears (*ursus arctos horribilis*) to Washington state. Grizzlies are native to Washington state and should be returned to their original station in nature, where they would help to restore balance to our state's natural heritage and ecosystem.

The North Cascades ecosystem is a prime habitat for grizzly bears. This region provides excellent habitat for grizzly recovery, as do the various wilderness areas in the North Cascades Grizzly Bear Recovery Zone. Despite this fact, the last confirmed grizzly sighting in the North Cascades was in

1996. In Washington state, grizzlies are identified as a "species of greatest conservation need" in our State Wildlife Action Plan.

According to the federal alternatives for action on reintroduction, grizzlies would be reintroduced slowly over a period of years. This is a reasonable method for proceeding with reintroduction, one that would give Washingtonians time to acclimate to the presence of the species. Alternative C would allow flexibility and be less restrictive for management - benefiting people, property and bears. This alternative demonstrates that the agencies have heard and are responsive to local concerns.

Thank you for the opportunity to comment on the Draft Grizzly Bear Restoration Plan for the North Cascades Ecosystem.

Correspondence: Hi. My name is [REDACTED] (phonetic.) I live in Twisp. A number of things that are on my list, I have heard already, and so I'll just skip to the ones I haven't.

One, I can't be in favor of B or C because I don't find the EIS at all compelling. It's pretty skinny on context. It doesn't mention, for example, there are 60,000 grizzly bears in North America, about half of them in Canada and half of them in Alaska.

The numbers that we're talking about are much smaller than that. The other thing that I find very odd, I've been involved as a retired scientist and before I retired in several EISs. This doesn't do the scenario of looking at the affects that the introduction will have on other populations. It mentions who - - who a grizzly sometimes eat. But who are they going to eat here with the prey that are available now is a question that doesn't appear in the EIS, and the answers certainly don't. The third point I want to make is that there are extensive studies of what happened with the grizzly bear not quite introduction but rejuvenation of the population. They were down to 136 bears in Yellowstone. They're now at 1,000 which is roughly the carrying capacity. And they've had very different relationships with the food chain than the famous wolf story, and none of that's in there.

There are publications on this that are in highly reputable journals, but it's not mentioned in the EIS. They've been useful for drawing conclusions or at least suggesting what'll happen when you put grizzlies here. Thank you.

Correspondence: This is a real rotten time for both of my hearing aids to go dead, so I guess I'm going to be up here talking and not listening anyway.

So if you guys remember, about something like 12 years ago, we had the same - - same kind of issue with wolves. They had meetings about whether we wanted them or not, and at the time I had wolves killing my livestock, and I turned it into two federal biologists. Both of them said that that was bologna, and one of them even told me that he would put that in his file with his bigfoot sightings.

Well, as most of you know, we went to court because we started shooting the wolves for killing our livestock, and of course we lost because you can't shoot them. I paid tens and tens of thousands of dollars in fines and penalties, felonies, and the only solution I came up with is to feed them.

I can legally feed them, and now I don't lose these livestock. And I'm feeding these wolves regularly, and I have not lost any cattle. The cattle come right through where I'm feeding them, and it's working. And I can do it all by my own self with no help from anybody. The only way I can raise livestock is I have to feed the wolves.

Now, what I'm saying is you guys are enjoying these wolf packs thanks to me. There's one in particular that I'm feeding because - - because if I wasn't feeding them, they'd be eating your cows and your chickens and your dogs. What I'd hate to

see happen is the grizzly bear situation get in the same boat, that we have to start feeding them because there's nothing for them to eat. When it gets to that point, I think we went too far.
So anyway, thanks for letting me speak. I'll keep feeding them wolves so I can keep raising cows.

Correspondence: Hi, everyone. My name's [REDACTED], and I live in Twisp. I live on a farm bordering public land, where we raise livestock. I'm an avid hiker and backpacker, and I support alternative C, active grizzly bear reintroduction alongside the 10-J rule.

As has been mentioned, grizzly bears were an integral part of our ecosystem here for thousands of years until settlers hunted, trapped, and poisoned them to local extinction. North Cascades is ideal grizzly bear habitat.

There's been a lot of talk tonight about diet, and I think there's been some misinformation. In frontier, grizzly bears - - so actually 80 percent of their diet is plants, insects, roots, tubers. Across the world grizzly bears have been shown to eat 124 different species of plants, and the North Cascade ecosystem is home to 100 of those species, which is pretty cool.

I personally have family in Western Montana and have been - - and have seen firsthand how rural communities that are very similar to ours ecologically, socioeconomically, and culturally are already living, recreating, and thriving alongside grizzly bears.

We know that preventative coexistence measures like electric fencing, Perkus (phonetic) composting programs, and bearproof garbage containers have been proven to work with grizzlies. I ask the agency staff to take into consideration the funding and resources needed to implement these preventative measures in our communities and plan for those accordingly. I also support the 10-J rule that will allow our communities and local agencies more management flexibility should any conflicts with bears arise. Tonight it feels like there's been some different information said about the 10-J rule, and it feels like a missed opportunity to give accurate information. And so I hope the agencies will - -will make an effort to come back and give our communities more accurate information on the 10-J.

Here in Washington and around the globe we're facing a biodiversity crisis of immense proportion. We're losing species left and right. Grizzly bears are an endangered keystone species that belong in the North Cascades, and we as a community have a once-in-a-lifetime opportunity to bring them back, making our ecosystem more (inaudible) for future generations by doing so. Thank you.

Correspondence: 172. Hi. My name is [REDACTED] and first I'd like to start by - - by thanking the National Park Service and the U.S. Fish and Wildlife Service for the opportunity to comment this evening on the reintroduction of grizzly bears to the North Cascades ecosystem.

I support the reintroduction plan. Grizzly bears have been in the north part of the North Cascade's ecosystem for thousands of years. They play an important role in the health of the environment and enhance the richness of the North Cascades.

As an avid outdoors person, I spend a lot of time in the wild. I think the probability that I may ever encounter a grizzly in the North Cascades is pretty minimum. It's my understanding that the reintroduction plan is to release three to seven bears annually over 5 to 10 years.

The goal is to establish an initial population of 25 bears, with a total population target of 200 bears. It may take 100 years to reach that total population target of 200 bears. That seems like a pretty conservative reintroduction plan to me.

I also think though that the reintroduction plan needs a parallel plan to go with it for all bears, a plan that emphasizes safe bear practices. We need to work with communities to enhance bear safety. That's for black bears and for grizzly bears.

There are examples of communities that have successfully implemented bear safe practices. We could replicate these

successful programs here in Washington. A simple example is trash storage and collection, a major bear attractant. I have a home in rural Chelan County, and in the summers, bears get into peoples' trash. There are bearproof receptacles available. We need to make sure that they're available for use and actually used. It's tragic that bears are currently being killed because we basically bait them with our trash, and then eliminate them simply because we cannot or will not dispose of our waste. I'd like to close my comment just to say that I'm in favor of the reintroduction plan. Thank you.

Correspondence: My name is [REDACTED] (phonetic) and I'd like to reiterate what you just said. I was in Okanogan on Friday or Monday evening, and I want to apologize to the Park Service folks, the Fish and Wildlife folks, for that gathering. I've lived in this county since 1979, ran a business here for 30 years. I know the people of this county. I know them well. And what you saw on Friday night in Okanogan does not represent this county. People of this county are better than what you saw on Friday night. And the difference between this meeting and that meeting, I'm proud to say that I live in the Methow Valley, and we can put on such a respectful evening as this. Now let's get to the bears. I support option C, which employs the 10-J designation. I've studied that quite a lot. I've looked at it thoroughly, and it looks to me like the park service has done a really good job of reaching out to the farmers, ranchers, people who oppose reintroduction. And this option C seems to be their sincere effort to employ all points of view in their - - in their planning. And I would urge everybody who hasn't delved into the 10-J rule and to option C which is their preferred alternative, and I can see why, to do so, read it thoroughly and then make your conclusions.

Correspondence: Hi. I'm 187, [REDACTED] (phonetic) geologist and backpacker. I worked in Alaska seven years at the U.S. Bureau of Mines, and they provided 44 magnum revolvers, and the Fish and Wildlife agency provided two days of training. They said, "Always carry your gun because grizzlies are dangerous." In (inaudible) I came down to Okanogan Valley. He shot 10 times, but the grizzly kept coming back closer and closer. After three miles and down to his last bullet, we rescued him in the helicopter. Will the Park Service change the state law to allow us to buy gun magazines greater than 10 rounds now? A grizzly charged four friends in Okanogan ground from half a mile away. Three rounds didn't slow him down. All four of them fired their guns when it was 25 yards away, and it finally ran away. Glacier National Park requires all hikers to carry bear spray. Bearproof cans are required for backpacking the 350-mile section of the Pacific Crest Town in the California Sierra. Will these be required in Washington now? My comment for the EIS last fall stated it needs to include all the bear attacks throughout history. A few examples; June 2016, a grizzly killed Brad Treat, Forest Service, law enforcement employee, while sitting outside Glacier National Park. July 2021, a grizzly killed Leah Lokan in her tent, in a Montana town, next to the post office. July 2021 in Island Park, Idaho, a grizzly mauls Tom Whitney jogging, and a mountain biker avoids injury being chased by a grizzly. There's no mention of all these attacks in the current EIS. My comments were ignored. Why? Don't you care about people getting mauled and killed? Apparently not. To all of government officials who want grizzlies, it appears that you're possibly approving a grizzly killing and mauling your children, parent, and friends, and someone else's children because in the EIS it states, "Negative interactions between humans and grizzly bears, while rare, do occur." Alternative B would result in adverse impacts on public safety. Under alternative C like alternative B, members of the public would retain the ability to take the grizzly into (inaudible.) There are numerous areas in other states people can go experience grizzlies in their native habitat. I just gave you some areas.

We don't keep them in our backyard. In my lifetime - - I am 71. I've talked to thousands of hikers, number one, to camp where bears are around, and none of them want to hike with heavier packs and bearproof cans, bear sprays, and guns.

Correspondence: I'm 185. I'm not - - I'm probably not going to say anything new to anyone here. You guys have heard most of it. But I have a question of how does this really help.

I've heard a lot of people talk tonight about protecting grizzlies and the reintroduction and what it will do to - - to numbers. And then we hear about deaths and attacks, and but something we haven't heard, and this is what I did a lot of research back in 2019 when this came up then.

And when bears are overpopulated in an area, whether it's for food or otherwise, they will - - they travel. They can get hit by cars, and they can get hit by trucks, and they go into areas they're usually not supposed to be in. And individuals will try to protect themselves, their families, or their stock. And that's not happening right now. So how does it help?

I've heard several people mention about the North Cascades doesn't have a fence. Well, it doesn't, and neither does Canada. Grizzly bears travel from Canada. They stay. Then they leave. They're not staying in the area because the area can't sustain them. And to drop animals that are going to starve to death or travel and get hurt or killed or hurt someone else, I don't see how that's a valuable way of spending our tax dollars. And thank you very much.

Correspondence: ██████████ (phonetic.) I am number 184. So I have a couple of technical things here I'd like to mention. First of all, the Secretary of the Interior, Bernhardt, terminated the EIS process for grizzly bears restoration. ESA section 4(b)(2) notes that the secretary may designate or make revisions of critical habitat based on scientific and economic and other considerations. And two, that the present Secretary of the Interior should have provided such time to make an economic justification for starting a new process. I have not seen it in the plan.

The nonessential 10-J designation indicates that grizzly bears with introduction into the NC - - well, sorry. The nonessential 10-J designation indicates that grizzly bears entering into the NCE conserves the species, but it is nonessential to its continued existence.

So classically the EIS is admitting that the grizzly bears are neither threatened nor endangered in a significant part of its range. So why wouldn't the option be to delist the bear and not introduce it?

The 10-J manage option still means that collateral damage must still be experienced before any option can be initiated, so it's not necessarily an improvement over the ESA. Thank you.

Correspondence: My name is ██████████. I've lived here for 47 years. I've never seen a grizzly, and I don't want to. So I flew for the Forest Service for about 20 years as a charter pilot. And one of the things I did was follow bears with collars. And I can guarantee you that there's no fence between Manning Park and upper Okanogan County. Yet there are bears, grizzly bears, three miles north of the border.

If you're a biologist and you said [REDACTED], can you show me a grizzly bear? I'd say, yeah, just a second. So we'd fly up there, go past the border, three miles, and there was a nice area there. It's kind of generally sloping south. In the - - kind of the midspring, you might see three or four grizzlies in that area.

Now, there's no fence keeping them up there. And so they could come down here, but they don't. So why are we trying to introduce them? It doesn't make a lick of sense.

And then there's the idea of money. I pay taxes just like all of you guys do. I would much rather see my tax money go for something productive, rather than wasting it on a bear study that's already been done, and it seems that the departments don't really understand what the word no means.

Correspondence: Good evening. My name is [REDACTED] I live in Wenatchee. I was a cherry orchardist there. My family and I had a cherry orchard on Stemilt Hill, which is outside of Wenatchee. And this has been a very long process. I've been following this for many years, as many of you have, and I wish it weren't such a long process. I wish we could just get this over one way or the other. But the decision was made to bring bears back into the North Cascades actually in 1991, which is 32 years ago.

So to the agencies, you've been at it for a long time. I - - I think you probably want to get this done too. But in that period of time, 32 years, we've learned a lot about grizzly bears in the North Cascades. We've learned - -there have been numerous studies done that indicate that the North Cascades is big enough, is wild enough, there's enough food for grizzly bears there, a viable population of grizzly bears.

One of the previous speakers tonight said that studies show that inland grizzly bears like those that were in the North Cascades or those in Glacier National Park eat about 80% plants and insects. And there is enough food for them in the North Cascades.

Studies have also shown that it's extremely unlikely that grizzlies will be able to repopulate the North Cascades on their own. I've got to hurry. So it's also clear that grizzly recovery must be done in a way that does not threaten the lives and livelihoods of local people. We've heard that very clearly tonight.

We - - as a cherry orchardist, we didn't have problems with bears. We had problems, and my neighbors especially had problems with Elk, and Elk can do a hell of a lot of damage to a cherry tree in a very short time. Thank you.

Correspondence: Comments on Draft Grizzly Bear Restoration Plan and Environmental Impact Statement for the North Cascades Ecosystem

Prepared by

[REDACTED]
[REDACTED]
[REDACTED]

Western Washington University

12 November 2023

The draft environmental impact statement (DEIS) and its cited literature provide a comprehensive assessment of the current status of grizzly bears in the North Cascades Ecosystem and three restoration alternatives. Due to the tenuous status of grizzlies in NCE and their highly interactive nature (Soule et al. 2003), a credible restoration plan must consider diverse ecological and social elements. The DEIS appears

to do so well.

Two of the three DEIS alternatives involve grizzly population augmentation, or translocation of bears into NCE. Translocations increasingly are being applied as a conservation tool, with mixed success. The DEIS cites Pérez et al. (2012), who described ten criteria for evaluating translocation projects and evaluated 454 published and unpublished translocation projects relative to those criteria. Pérez et al. (2012) concluded most projects addressed less than half of the criteria, and less than 1% addressed all ten. By comparison, the NCE grizzly DEIS is very good (Table 1). The DEIS addresses eight of the 10 criteria directly, and partially addresses the remaining two criteria. The status of NCE also is consistent with the criteria: grizzly augmentation fulfills five of the 10 criteria strongly or fully. Of the remaining five criteria, three are either beyond control of the lead agencies or are subject to societal perceptions that preclude consensus on organisms such as grizzly bears. The remaining two criteria (2 and 7 in Table 1) are amenable to adaptive measures as described in the DEIS. In summary, population augmentation or translocation is an appropriate means to achieve grizzly conservation goals in NCE, and the DEIS has evaluated most risks, potential costs, and benefits.

Table 1. Criteria for evaluating translocation projects, from Perez et al. (2012).

(1)

Criteria: Is the species or population under threat?

Addressed in DEIS: Yes

Status: Yes

(2)

Have threatening factors been removed/controlled, or absent in release area?

Addressed in DEIS: Partly

Status: Partly

(3)

Are translocations the best tool to mitigate conservation conflicts?

Addressed in DEIS: Yes

Status: Yes

(4)

Are risks for the target species acceptable?

Addressed in DEIS: Yes

Status: Yes

(5)

Are risks for other species or the ecosystem acceptable?

Addressed in DEIS: Yes

Status: Yes

(6)

Are the possible effects of the translocation acceptable to local people?

Addressed in DEIS: Yes

Status: Mixed

(7)

Does the project maximize the likelihood of establishing a viable population?

Addressed in DEIS: Partly

Status: Uncertain

(8)

Does the project include clear goals and monitoring?

Addressed in DEIS: Yes

Status: Yes

(9)

Do enough economic and human resources exist?

Addressed in DEIS: Yes

Status: TBD

(10)

Do scientific, governmental, and stakeholder groups support the translocation?

Addressed in DEIS: Yes

Status: Most

The DEIS gives appropriate emphasis to adaptive measures. Grizzly bears have been well-studied in other regions, including ecosystems not far from NCE. Results of this work provide a strong basis for planning NCE grizzly restoration, but some uncertainty is inevitable due to unique NCE characteristics. In particular, lack of data on NCE grizzly food utilization, spatial movements, and responses to climatic variability lead to uncertainty about grizzly restoration and management. In this context, an adaptive restoration approach is essential. The DEIS gives due emphasis to adaptive measures. Despite the comprehensive scope of the DEIS, I offer several technical suggestions that would strengthen the scientific basis for NCE grizzly conservation planning.

First, population growth rates and projected time intervals required to achieve the 200-bear restoration goal appear to be overly optimistic. These rates and times appear to be derived from age-specific grizzly survival rates, given on page 64 in the DEIS. The assumed survival rate for adult females is at the upper extreme in the range of values reported from five grizzly populations (Wielgus 2002), and a full standard deviation above the mean. Projected population growth rates depend sensitively on adult female survival; growth would be slower and time required to reach the 200-bear restoration goal would be longer under a more realistic survival rate. In practice, grizzly survival rates for any age class are unknown in NCE, and the restoration plan could be adjusted accordingly as monitoring data become available.

Second, the decisions about the proposed alternatives could be reached with greater confidence if the DEIS evaluated the likelihood of achieving the restoration goal under each alternative. Population viability analysis (PVA) is the appropriate method for conducting such evaluations. PVA would require estimates of grizzly demographic rates, uncertainty in those rates including effects of environmental variability, and effects of management actions on those rates. Two data sets available in the scientific literature could be adapted for this purpose, published by Wielgus (2002) and Pease and Mattson (1999). Neither includes NCE bears, but they could be used to develop baseline scenarios from which alternatives could be evaluated and adaptation measures could be developed. PVA would inform the restoration program with depth and rigor commensurate with analysis in Lyons et al. (2016). As restoration monitoring proceeds, data on NCE grizzlies could be incorporated into PVA population models to inform adaptive measures with NCE-specific analyses. Without PVA, the NCE grizzly restoration program will require greater reliance on adaptive measures, with commensurate funding and staffing resources available over longer time periods required to achieve restoration goals.

The DEIS concludes that grizzly restoration would not be achieved under Alternative A. PVA can quantify this conclusion. Under optimistic assumptions about environmental conditions, extinction by mid-century is certain (100% probability), with a mean persistence time of 5.5 years. (PVA results obtained by me from 1000 simulations using initial abundance of six bears, as in Romain-Bondi et al. 2004.)

The DEIS needs clearer analysis of important food sources associated with grizzly population viability. The DEIS and the Ransom et al. (2023) article it cites documented a large diversity of plant, fungi, and animal food sources. They did not identify abundant food(s) available in high density during the late summer-fall period of grizzly hyperphagy. Viability of grizzly populations in other regions is associated with one or more such food sources. The DEIS did not identify such a source in NCE, and relevant sources in other systems have declined markedly in NCE or are absent (e.g., salmon, whitebark pine seeds). Including analysis of key food source availability would indicate whether restoration of those food sources is necessary for grizzly population viability, and hence would inform restoration planning and resource allocation.

Finally, restoration planning should include analysis of population and habitat connectivity to regions beyond NCE. This issue has not been adequately addressed throughout IGBC efforts, but it is essential to address grizzly restoration in the long term. Lack of analysis of inter-ecosystem connectivity is not likely to substantially alter conclusions in this DEIS or decisions regarding restoration in NCE.

As written the DEIS is very good, with comprehensive consideration of most translocation criteria outlined by Pérez et al. (2012). With revisions described above, a final EIS could address all ten criteria in Pérez et al. (2012), and thereby rank in the top 1% of comparable conservation plans.

Thank you for your consideration and for your excellent work.

Correspondence: Good evening. I'm [REDACTED]

(phonetic) C [REDACTED] I just want to get up and voice my opposition to the reintroduction of grizzlies into the North Cascades. I'd rather stick with the alternative A and let things go as it be.

In this valley, when I first came here back in the late 80s - - I've lived in other parts of the country. They're similar, Colorado, other areas that - - and when I came here, I thought this place was going to explode right away. There's going to be (inaudible.)

Well, it's taken about 40 years, but it's happening, and with more and more people coming in, more and more homes, more and more pressure on local resources taking time to try and prevent a problem that we don't have, you know, if we introduce bears, we're going to have a problem. We - - we've got local ranchers, people that have been here for generations that know that we haven't had a history of grizzly bears coming out of the North Cascades because it doesn't happen for whatever reason.

If they stay in Canada, that's great, but if - - I don't see why we would want to start a problem where we don't have one currently, when we've already got other issues - - other natural resource issues. The issue about mule deer was brought up. If you hunt, you've seen it.

We reintroduced wolves, and I'm pretty certain besides the fires, that's been probably our biggest impact on the mule deer herd. So what's going to happen if we introduce another apex predator into our mix? Let's work on what we - - what we can have here now and support that going forward. Thank you.

Correspondence: Stan from (inaudible.) My dad was in the

CCs and Forest Service in the 40s, and having (inaudible) they had a grizzly about take the radiator out of their Model T truck. That was the first one I ever heard of.

My cousin, Tom, go hunting up - - Tom Hoyt

(phonetic.) That's just below Manning. There was four grizzly bears in the sight of view one day. Rocky Wilson (phonetic) shot the last legal one in 1968 over by Marblemount, so they haven't been hunted for like 58 years.

Yes, there have been sightings. They've come and they've gone. There's a reason why they don't want to be here. I asked at the meeting we had four or five years ago if anybody knew, of all of our parks people and game department, where the designated grizzly bear habitat was in the Mount Baker-Snoqualmie Forest, and nobody knew the answer, which I thought was strange. 2001, I believe it was, I was packing fish from the game department, and Doug Huddle (phonetic) the biologist, he was laughing and asked me that question. I said, I got no idea.

The Fannie Creek (phonetic) block of forest south of the Skagit River, south of Concrete, between Darrington and Arlington, that's their habitat. He says that we've got a couple across the Mount Baker Highway through Glacier Maple Falls, through Concrete, Lyman, Hamilton, swim the Skagit River to get to where they're supposed to be. And why didn't any of these bear experts know that? I have no idea.

But why are we trying to reintroduce something that never really has been here. And that meeting we had four to five years ago, the guy had the stats from the Hudson Bay Company, and there was only one or two grizzly bear hides that'd been taken in 18 whatever. So that's my question. Are they really bear experts? Thank you.

Correspondence: So, anyway, my name's [REDACTED] My wife, [REDACTED], and I are both native Washingtonians. I grew up over here, spent a lot of years working on the other side of the mountains, and always called this home. But the last few years I've heard a lot about bringing, you know, the salmon back to streams and creeks around here, and I - - I get these really exceptionally well-done flyers on this embossed paper and what they're going to do to bring back salmon. And then I hear people talk about how we need to build their habitat back before we reintroduce them. So I'm absolutely afraid not to introduce them because we aren't anywhere close to being ready. And I'll tell you what the dinner bill is. The dinner bill is our \$40,000 horses, sitting there where they can't run - - can't outrun a grizzly bear. A black bear - - I'd put our Friesian horses up against a black bear. A grizzly bear, nuh-uh. I've seen what they do to elk, moose, and mainly people. Some of those years weren't just spent on the other side of the mountains. They were spent on the pipeline in Alaska. And I'll tell you what. There's a whole bunch of Alaskans, at least all the ones that I know, who say if we've got an opportunity to keep them out of here, by God you better do it. I mean, do people know what's going on with the coyotes around here? Do you think that grizzlies are stupid? They're just as smart as coyotes, and they can hunt. And when they eat berries, it's - - you know what? They eat what's available. And they were smart, and they could adapt, and if this was habitat, and we're ready for grizzlies, they'd already be here.

Correspondence: Dear Secretary Haaland,
As state representatives for Washington's 39th Legislative District, we are writing to express our strong opposition to the proposed North Cascades Ecosystem Grizzly Bear Restoration Plan that would reintroduce grizzly bears to the North Cascades region.

While we respect the efforts of your department to conserve and protect wildlife in this country, we have thoroughly reviewed the proposal plan and have come to the conclusion that its implementation would negatively impact our local communities and ecosystems and put the public at risk.

During the National Park Service's public comment period, we have received direct feedback from our constituents. They oppose this plan. The 39th District is comprised of a diverse range of stakeholders, including farmers, ranchers, and outdoor enthusiasts. Opposition is strong due to the increased risk that would be present for potential conflict between bears and humans. Moreover, the North Cascades ecosystem is already home to countless wildlife species. The reintroduction of grizzly bears may disrupt the delicate balance of this ecosystem, potentially harming native species and habitats.

In closing, we are asking the US. Department of the Interior to immediately suspend the proposed North Cascades Ecosystem Grizzly Bear Reintroduction Plan. We trust the DOI to seriously consider the concerns of the residents we represent and work toward a more sustainable approach "that promotes the well-being of our local communities and natural environment. Thank you for your attention on this matter. I look forward to receiving your response.

Correspondence: Hi. My name's [REDACTED] I'm from Twisp. I'm a retired ocean ecologist. And in my world, the ocean world, people always argued about is it top-down control, is it bottom-up? Is it the structure of the ocean, the nutrients? Is it the chemistry? And the answer is, it's all of these things. And, you know, I keep thinking about what did the landscape look like when there were beavers. I took Bill Hatel's (phonetic) course when he was talking about the local history in Washington State and Native Americans, and he talked a lot about Beavers.

By 1840, the beavers were exterminated. Maybe we're putting our money in the wrong direction. Maybe we should do the hard work first and help restructure and re-heal the land. Bring back beavers. If I've got to put my money any place, I'd go with beavers.

Correspondence: Okay. So my name is [REDACTED]. I'm a resident of Bellingham, but I grew up in Skagit. I have a long time, years, decades playing in Skagit. A lot of hiking in the cascades. A lot of good points tonight. I recognize both sides. There's very heartfelt, you know, feeling on this.

However, I'm old. Nostalgia's great. The world changes. We have to recognize that. The environment is not conducive to this. You're bringing in an apex predator that's going to create conflict.

Now, I look at the process. In the past I've actually ran some programs with biologic controls, including a lot of tagging, collaring. So I look at the 10-J section sort of as something that was brought in to make this more amenable to people to accept it.

I would like to suggest some modifications to the 10-J section. First of all, I think we have the opportunity here if we collar these bears, to actually collar them with tracking that can be monitored. And I'd go and I'd ask the rangers and the sheriff to issue those bears, if they get outside their bounds, a ticket, and make sure that they're held accountable because I think if we don't address these conflicts appropriately, their reward is going to be your neighbor's dog or even maybe your neighbor, perhaps seasoned with a little bit of pepper spray. So that's my comment.

Correspondence: Hello. I've probably spent more time in the wilderness than anybody here, so I've got to tell you, you're going to start to (inaudible) into August, first of September. It was all of these old hikers that started the Pacific Crest Trail in Mexico, and they were trying to get - - to get to the Canadian border.

And growing up or living and helping build trails in the mountains, I knew of all the big, good, berry patches on the Crest Trail in Hopkins Pass, and I'd get - - and I can visualize that poor old boy that walked all this way with his two fishing poles, carrying a pack, but there'd be a grizzly in the berry patch, so the Forest Service will say, "No, you can't go in there now because the grizzly's got the right of way." So you've got to wait until he leaves the berry patch.

I've seen the trails in the Methow and the safe wilderness go straight to hell in my lifetime after 35 years. I did a lot of that, and to me, when you have

(inaudible) come along with five or six mules tied behind you, and you meet old grizzly on the steep hillside of a narrow trail, I don't know who's going to be able to back up or turn around.

And it's these kinds of things I don't think we need and we don't have. And it's been my theory in life if you're not in a wreck, don't go get in one. And I believe that to be a fact that there's no sense in bringing something that's going to cause trouble, whether he does or he doesn't. Thank you. Okay.

Correspondence Type: Transcript

Correspondence: Number 072. Thank you for taking my comments at this meeting. My name is [REDACTED], and I live in Skagit County. I've worked and recreated in the North Cascades ecosystem for the past 31 years. Prior to that, I worked in the greater Yellowstone ecosystem.

I think the draft EIS is strong, and with the use of the 10-J rule, it addresses many of the concerns people have expressed about the restoration of grizzly bears to the North Cascades. The care with which the bears will be selected, coming from a similar food economy, radio collared, and monitored, and the slow rate of relocation all assure me that the program will be carried out in a systematic and science-based manner.

I worked on some of the early efforts to find bears here in the North Cascades. That was more than 30 years ago, following up on sightings reported by hikers to the Department of Fish and Wildlife, and making attempts to attract bears in areas of likely habitat. As you know, we didn't find anything. Without an active restoration effort that is alternative A, we will not see grizzly bears return to the Cascades, and we and the ecosystem will be lesser for that.

For 20 or more years I've been volunteering for a University of Washington program that monitors populations of rare plants on public lands throughout the state. I usually request assignments in the Pasayten Wilderness because it feels like the wildest place I can find in Washington State.

I'm willing to camp with care in these places because I feel we need to share the wilderness with all the species in the ecosystem. The notion that we need to have completely safe experiences in the areas -- in the wildest areas of this incredible country seem very selfish to me.

So many people have become unwilling to share even the remotest places on earth with other creatures. The ecosystems we depend upon are breaking down because of this. Restoring bears to the ecosystem is important for a whole host of reasons, some of which we may not know yet. The North Cascades needs grizzly bears. I encourage you to adopt alternative C in the DEIS and implement the 10-J rule.

Thank you for your service to our wildlands and wildlife that make them the jewel of our nation.

Correspondence: Thank you. I'm 080. I'm (audio disruption.) Thank you for this opportunity to speak in support of restoring grizzly bears to the North Cascades. I'm here on behalf of my role with the Living Northwest Program at Woodland Park Zoo. Each year more than a million adults and children pass through the zoo's gates to spend time with the animals who live in our care. Our job is to help ensure that when visitors leave through those same gates, they know a bit more about the realities of wildlife placed in their natural environment and feel inspired to make conservation a priority in their own busy lives.

When recently at the zoo, I stood among dozens of people as they watched our young rescued brown bears, Juniper and Fern, chase each other around like siblings in their habitat display, splashing in the stream, digging up plants, rolling over logs like they would in the wild.

The audience was spellbound, clearly in awe of these magnificent animals. I overheard one enthusiastic woman who grinned ear to ear, while holding a baby in her arm, lean over and say to her companion, quote, "We've waited our whole life for this moment." The same can be said of grizzly bear recovery in the North Cascades.

Before any of us were born, the grizzly bear population was basically gone here. We all inherited a legacy of ecological and cultural loss that we now have an incredibly rare chance to reverse. Alternative C will allow the National Park Service and Fish and Wildlife Service to reintroduce grizzlies slowly, carefully, at a flexible management capacity so that our grandchildren can inherit a different type of legacy, one of tolerance and appreciation for grizzly bears.

Woodland Park Zoo recognizes that reintroducing grizzlies is not a trivial matter. We're committed to using our diverse resources to promote coexistence between people and bears, and we look forward to ongoing conversations about how we can help make alternative C a success.

We've waited our whole life for this moment. Let's work together to bring grizzly bears back to the North Cascades. Thank you.

Correspondence Type: Transcript

Correspondence: I'm 078. I'm Dr. [REDACTED], and I'm a resident of both Chelan and Whatcom County. I'm cochair of the Washington Sierra Club Wildlife Committee, and I'm providing comments for the National Sierra Club. The National Sierra Club has over 3.7 million members and supporters and is the oldest engaged and (audio disruption) grassroots organization in the United States, with the largest membership of all environmental public advocacy groups. The Washington State seat chapter at the Sierra Club includes over 100,000 members and supporters. Sierra Club has a strong national interest in full recovery of grizzly bears in the lower 48 states. We support restoration of grizzly bears into the North Cascades ecosystem and want to ensure that it's done right.

Young, healthy, non-conflict bears will be taken out of their native ecosystem, likely from Montana, for this restoration. They must be given every chance to succeed in the North Cascades. We are concerned the proposed 10-J rule, although we support it, will not provide sufficient protections as it's currently written.

So we would like these things to be significantly revised. One, no incidental take should be allowed. Two, the authority (inaudible) grizzly bear should only be considered where there is a demonstrable threat to human safety, and for nonimmediate threats to human safety, only after nonlethal removal options and utilization of conflict prevention methods have been exhausted.

Three, no grizzly bear should be hazed or relocated as a result of conflict with livestock, unless demonstrable, repeated efforts have been made by the livestock producer to prevent such conflicts using commonly available techniques. No grizzly bear should be killed on public lands as a result of livestock degradation.

Five, landowners should not be given a permit or otherwise authorized to kill grizzly bears. And six, no grizzly bears should be preemptively relocated if the bear is not a threat to human safety, particularly if the bear has not become habituated or food conditioned. Doing so acts as a disincentive for communities to employ conflict prevention methods and increases the

risk to the bear of injury or death from capture and relocation.

We appreciate the time and effort spent on restoration and the Biden administration's willingness to reestablish grizzlies in the North Cascades' ecosystem. The Sierra Club strongly urges the strengthening and protections and revision of the 10-J rule for enduring a successful grizzly restoration in the North Cascades ecosystem. Thank you.

Correspondence: Comment: Proposed Grizzly Bear Reintroduction in the North Cascades Ecosystem (NCE)
U.S. Fish and Wildlife Service Proposed Rule: FWS-R1-ES-2023-0074-0001
National Parks Service Draft Grizzly Bear Restoration Plan / Environmental Impact Statement

Note:

The following comment is a draft version and we hope that the action agencies (USFWS and NPS) will accept and give full consideration to the complete version which will be submitted in mid-December. We ask for this extension of consideration for a final draft as we are students in an Environmental Decision-Making law class at the University of Colorado, Boulder and we are operating on an academic timeline.

Introduction

As students studying natural resources and environmental management, policy, and law, we have taken a particular interest in the proposed restoration of a grizzly bear population to the North Cascades ecosystem. One of the authors of this comment completed his undergraduate degree in Washington and spent a significant amount of time recreating in the North Cascades Ecosystem admiring the flora and fauna that the diverse region supports, and the other author used to enjoy catching occasional glimpses of grizzly bears while he lived in Montana. This proposed rule, draft restoration plan, and draft environmental impact statement offers the chance to consider restoring a population of threatened bears to an ecosystem that has historically hosted them for millennia. Through the commenting process, the public can assist the FWS and NPS in finalizing planning documents in a manner that leads to outcomes that are responsible to contemporary human communities and the regulations and guidelines outlined by the Endangered Species Act, Grizzly Bear Restoration Plan, and other documents. The North Cascades Ecosystem Grizzly Bear Restoration Plan / Environmental Impact Statement evaluates the impacts of a range of alternative approaches for restoring the grizzly bear to the North Cascades Ecosystem (NCE) grizzly bear recovery zone, a portion of its historical range. This plan/DEIS evaluates the impacts of the no-action alternative (Alternative A) and two action alternatives (Alternatives B and C). All action alternatives would seek to achieve a grizzly bear restoration population and the no-action alternative (Alternative A) would continue existing management practices with no grizzly bear reintroductions. Under both action alternatives, it is anticipated that 3 to 7 grizzly bears would be released into the NCE each year over roughly 5 to 10 years, with a goal of establishing an initial population of 25 grizzly bears before switching to adaptive management.

Under Action Alternative B grizzly bears restored to the NCE would be managed as a threatened species with the existing special rule (50 CFR 17.40(b)) under section 4(d) of the Endangered Species Act (ESA) governing the regulation of grizzly bears in the lower 48 states as other grizzly bears in designated recovery zones are managed. Under Alternative C, the preferred alternative, the FWS would designate grizzly bears in the US portion of the NCE and surrounding areas as a 10(j) nonessential experimental population (NEP) under section 10 of the

ESA. A 10(j) NEP designation would allow for different management abilities such as greater allowance for takings of grizzly bears. Our comments, suggestions, and recommendations for the proposed rule and plan/DEIS are outlined as follows:

Primary Comment Elements:

- 1) Critiques and Recommended Updates to Scientific Basis of Carrying Capacity, Initial Population, and Adaptive Management Practices
 - a) Carrying capacity estimates should reflect best available information
 - b) Initial population re-establishment: Lessons from augmentation efforts in Cabinet-Yaak Ecosystem
 - c) Adaptive management outcomes should be qualitative rather than quantitative goals to reflect the principles of the management framework

- 2) Evaluation of DEIS Action Alternatives and Support for Alternative B
 - a) Grizzly bear reintroduction in the NCE needs to be kept closely grounded in the meaning and intent of the Endangered Species Act
 - b) Support for DEIS Action Alternative B
 - c) No Support for Action Alternative C or FWS Proposed Rule

- 3) FWS Should Designate Critical Habitat for Grizzly Bears in the NCE
 - a) FWS Has Failed to Designate Critical Habitat for Grizzly Bears Historically, and Should Designate Critical Habitat in the NCE if it is Serious About Recovery
 - b) The NCE is an Ideal Location To Designate Critical Habitat for Grizzly Bears

- 4) Support More Educational Programming to Limit Impacts of Human-Bear Encounters
 - a) Agencies Should Target Educational Efforts at Backcountry Recreationists
 - b) Agencies Should Make Bear Spray Available for Groups Recreating in the NCE, And Should Install Bear Wires At Campsites
 - c) Agencies Should Partner With Local Groups Already Focused on Human-Bear Coexistence
 - d) FWS Should Promote Compensation Programs and Non-Lethal Preventative Approaches for Ranchers to Counter Livestock Depredation by Bears

1) Critiques and Recommended Updates to Scientific Basis of Carrying Capacity, Initial Population, and Adaptive Management Practices

The US Fish and Wildlife Service and National Parks Service have gone to extensive lengths to build accurate and comprehensive scientific information into the foundation of the Restoration Plan/ DEIS and Proposed Rule. However, there is room for improvement that more functionally incorporates the NCE carrying capacity estimates, initial introduction plan, and adaptive management framework. Firstly, carrying capacity estimates should be updated to reflect best available information, primarily recent studies that project climate impacts on ecosystem health in the NCE. Secondly, in planning for initial population re-establishment, the agencies should take a hard look at the recent augmentation efforts in Cabinet-Yaak Ecosystem to compare augmentation successes with the small proposed initial population in the NCE. Lastly, adaptive management outcomes should be reevaluated and further specified as qualitative rather than quantitative outcomes to reflect the principles of the management framework and integrate new information.

Carrying Capacity Estimates Should Reflect Best Available Information

The DEIS and proposed rule reference five studies that examine grizzly habitat in the NCE, two of which offer specific analysis of contemporary or future carrying capacity. A 2018 evaluation of current habitat provides the basis for the current carrying capacity estimates; "The mid-range scenario results of 139 females, or a total population of 278 bears, represented the most plausible scenario for this ecosystem."¹ This estimate of the NCE holding a carrying capacity of 278 individuals is the basis for the target population restoration of 200 individuals within 60 to 100 years. Given this long time horizon for grizzly bear restoration in the NCE, it becomes necessary to consider the effects of climate change on the ecosystem as a whole, and consequently the effects it will have on grizzly habitat and carrying capacity. It makes no sense to set a goal or target populations based exclusively on current conditions when that target is set for 60 to 100 years in the future, and will undoubtedly face different climatic and ecological conditions.

The 2023 study that is cited in the DEIS states that the projected future shifts in vegetation in the NCE may result in high quality grizzly bear habitat increasing across all climate scenarios, and that "estimates of carrying capacity in the future NCE project an increase of at least 70% across scenarios of future climate as compared to current conditions."² These projections on ecosystem impacts from climate change alter the overall carrying capacity estimates for the ecosystem through the coming century. The study notes:
At the most plausible home range of 280 km² and across climate scenarios, we estimated a carrying capacity of 241-289 female grizzly bears by the 2080s.
Assuming a 50:50 sex ratio, the estimated grizzly bear density in the NCE would thus be 20-22 bears/1000 km² (male and females) by the 2080s.³

These increases in carrying capacity come both from the increased density of bears per the projections (from the 2018 estimate of 17 bears/1000 km² to the 2023 estimate of 20-22 bears/1000 km²), and from an increase in available high-altitude habitat due to climate change. Considering that the target population is currently set to be reached between the 2080s and 2120s, the 2023 report considers a realistic carrying capacity to be 481-578 total bears as opposed to the 278 bears that the 60-100 year population goal target is based on.

The proposed target population should be updated from 200 bears to better reflect

the latest scientific information, which takes into account future climatic changes and is found in the 2023 report. While the 2023 report does not specify a guideline target for grizzly reintroduction, the goal population target should nonetheless be reflected by what our data and projections tell us about future conditions. Basing a 60-100 year target on current conditions is less sensible than basing a target on the best science, data, and projects that we have for the targeted period of time. Managers must leave room for uncertainty in future ecosystem conditions, but as the agencies acknowledge that the population target of 200 bears in 60-100 years is "conservative" based on current conditions, it is an extremely conservative target given the scientific evidence we have that supports enhanced habitat and carrying capacity for grizzly bears.⁴

Initial Population Re-Establishment: Lessons From Augmentation Efforts in Cabinet-Yaak Ecosystem

The Cabinet-Yaak Ecosystem (CYE) is one of six overall designated recovery zones for grizzly bears in the lower 48 states, and one of four that currently hosts a population of grizzly bears. The USFWS has augmented the grizzly population in the CYE since 1990 when research indicated a declining population with only 15 members. "Primary objectives are to bolster reproduction through the addition of female bears and improve overall genetic diversity through the addition of female and male bears. Twenty-two bears have been added in the Cabinet Mountains since 1990."⁵ When augmenting the bear population in the CYE to reverse the declining trend of the population, managers considered the quantity of individuals based on the need to increase genetic diversity, the size of the ecosystem, projected mortality of individuals, and other factors. As the population now numbers at 55-60 individuals, with steady augmentation efforts, the CYE grizzly management approach can serve as analog for grizzly restoration efforts in the NCE.

There are some important differences between recovery zones and restoration approaches, including the differences in ecosystem size. The NCE is nearly four times the area of the CYE at 25,305 km² versus 6,705 km², complicating how bears in numbers far below the carrying capacity locate and mate with each other. The total population target size is different for the NCE and CYE, however bear densities remain similar. For the CYE, "potential densities for the entire sample area averaged 2.1 bears/100 km² [21 bears/1000 km²]." This expanded population estimate is similar to the estimated bear density for the NCE of 20-22 bears per 1000 km².⁶ It is also important to consider that the NCE restoration will begin with fully reintroduced individuals rather than bolstering and diversifying existing genetic stock.

Despite the differences in ecosystems and bear populations between the CYE and NCE, there are some important commonalities that offer learning opportunities and which should be reinforced in the DEIS. The CYE population has been experiencing a growth trend of 1.6% annually, not including additional augmentation bears.⁷ 22 bears have been introduced to the CYE since 1990, in addition to the estimated 15 bears that made up the population previous to introduction efforts. While this introduction effort is over a 32-year time horizon, it is similar to the initial target population of 25 bears as outlined in the DEIS and proposed rule. This growth rate, however, takes place in a management area 26% of the geographic size of the NCE and with a foundational population of 15 grizzly bears. While we can consider the slow growth rate in the CYE to be the result of the 0-2 annual grizzly introductions to the ecosystem over the past 32 years, we cannot immediately expect a similarly small introduced bear population to establish a growth rate akin to the CYE's without examining other factors. Mortality has been a factor in population management in the CYE for both introduced and existing bears within the population. "Of 22 bears released through 2021, 8 are known to have left the target area, 5 were killed by humans, and 2 died of unknown causes."⁸ These bears have contributed to population growth through offspring but have faced losses. Between an established population pre-augmentation, a slow growth rate with continued augmentation, and mortality, the CYE demonstrates the need to establish a significant baseline population to encourage population growth.

In considering both the slow population growth rate and mortality of introduced individuals in the CYE, land managers must remember that introducing a population of grizzly bears in the geographically-large NCE too conservatively will not encourage the growth necessary to maintain a self-sustaining population in the ecosystem. As stated in Chapter 2 of the DEIS, it is likely that 11 bears will be reintroduced following the initial staged release of 25 bears. Considering the CYE examples discussed above, which support a larger initial population, the FWS should be transparent about the expected starting population and update the initial population count to 36. As the CYE demonstrates, erring on the conservative side and not introducing enough bears through the first stage of restoration will not create the population

foundation necessary to establish a self-sustaining and successfully reproducing population.

Adaptive Management Outcomes Should Be Qualitative Rather Than Quantitative Goals to Reflect the Principles of the Management Framework

Adaptive management principles should be discussed wherever possible in the DEIS and proposed planning documents. While these principles are present in the management strategy, they are not present enough through each opportunity for adaptive management, nor are they explicitly stated with enough background or detail in the introduction. DOI regulations define adaptive management as "a system of management practices based on clearly identified outcomes and monitoring to determine whether management actions are meeting desired outcomes; and, if not, facilitating management changes that will best ensure that outcomes are met or re-evaluated." 9 Desired outcomes should reflect the action areas outlined in the Purpose and Need statement and the Objectives in Taking Action statement. The action areas are outlined as follows:

- Restore grizzly bears to the NCE where they have been functionally extirpated from the ecosystem.
- Contribute to the restoration of biodiversity of the ecosystem to build ecological resilience and for the benefit and enjoyment of present and future generations of people.
- Enhance the probability of long-term survival of grizzly bears in the NCE and thereby contribute to overall grizzly bear recovery through redundancy in multiple populations and representation in a variety of habitats.
- Support the recovery of the grizzly bear to the point where it can be removed from the Federal List of Endangered and Threatened Wildlife.¹⁰

Based on the action areas outlined in the P&N statement, 'desired outcomes' should be qualitative rather than quantitative. As such, the agency should define the desired outcomes as a "healthy, self-sustaining grizzly population within the bounds of the estimated carrying capacity of the ecosystem," rather than a hard number for a population target, like the 200 bears figure which is currently stated. While a 60-100 year quantitative population target will help guide the agency in short, medium, and long term management decisions, that number should be viewed as a flexible component of an adaptive management framework that works towards a qualitative goal, such as a healthy and self-sustaining population, rather than the specific desired outcome that the adaptive management plan works towards. Agencies have the opportunity to consider the outcomes of adaptive management through both the phases of initial introduction and population establishment through intermittent evaluation of the ultimate target population.

Despite 54 occurrences of the term 'adaptive management,' the DEIS doesn't adequately define specific potential outcomes of the adaptive management framework. Instead, the agency uses vague statements like:

The restoration population goal [200 bears] is thus seen as a population size that can be adaptively managed for genetic viability and long-term persistence, and may or may not require active human intervention. This restoration population goal could be adjusted based on information gained from monitoring grizzly bears and their overall population response during the adaptive management phase of the action alternatives.¹¹

This management perspective that the population goal can be adjusted based on future information does not shine through the DEIS in the way that the 200 bear population target does.

The FWS and NPS need to bring the explicit sentiment about adaptive management that adjusts quantitative targets as new scientific information is gathered to every section of the DEIS and proposed rule where adaptive management is mentioned in a substantive way.

2) Evaluation of DEIS Action Alternatives and Support for Alternative B

In creation of the proposed rule and draft Grizzly Bear Restoration Plan / DEIS, the FWS and NPS have included two action alternatives that address grizzly bear reintroduction and management in similar ways. The action alternatives both carry out reintroduction of the bears in a similar manner, but they diverge in terms of the overall management framework. One plan follows the standard management framework used for the existing four populations of grizzly bears in the lower 48, while the other plan uses a new framework for grizzly management under ESA section 10(j), designating the bears as a nonessential experimental population. In considering these alternatives, the agencies should remember to keep grizzly bear reintroduction in the NCE closely grounded in the meaning and intent of the Endangered Species Act. We also advocate for the agency to reconsider Action Alternative B over Alternative C, as it allows for similar grizzly takings while better adhering to the principles of the ESA and the stated Purpose and Need of the DEIS.

Grizzly Bear Reintroduction in the NCE Needs to be Kept Closely Grounded in the Meaning And Intent of the Endangered Species Act

The Draft Grizzly Bear Restoration Plan / DEIS propose two action alternatives for the restoration of a grizzly bear population in the North Cascades Ecosystem, both of which would take place under the authority of the Endangered Species Act (ESA). Congress noted in the ESA that:

The purposes of this Act are to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved, to provide a program for the conservation of such endangered species and threatened species, and to take such steps as may be appropriate to achieve the purposes of the treaties and conventions set forth in subsection (a) of this section.¹²

The second clause of this statement, "to provide a program for the conservation of such endangered species and threatened species," is primarily relevant to the context of the alternatives already outlined in the DEIS as the aim of each is to create a restoration program for the conservation of a threatened species.¹³

In the context of these proposed actions, it is also necessary to keep the program framed within the context of the ESA. "The term 'threatened species' means any species which is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range."¹⁴ Additionally, the ESA notes that:

The terms "conserve", "conserving", and "conservation" mean to use and the use of all methods and procedures which are necessary to bring any endangered species or threatened species to the point at which the measures provided pursuant to this Act are no longer necessary. Such methods and procedures include, but are

not limited to, all activities associated with scientific resources management such as research, census, law enforcement, habitat acquisition and maintenance, propagation, live trapping, and transplantation, and, in the extraordinary case where population pressures within a given ecosystem cannot be otherwise relieved, may include regulated taking.¹⁵

The aim of "conservation" of a species per the definition of the ESA is to bring a threatened species to the point where the measures provided in this act are no longer needed. Therefore, the goal of conservation action should never be to indefinitely manage a species or population under the auspices of the ESA but rather to support the recovery and self-sufficiency of a given species. Specific programs and actions taken by agencies in the process of ESA species conservation, even those carried out as exceptions, should reflect this ultimate goal of removing a species from ESA management.

Support for DEIS Action Alternative B

The DEIS action Alternative B proposes to restore a grizzly bear population to the NCE as a threatened species with the special rule (50 CFR 17.40(b)) under section 4(d) of the ESA governing the regulation of grizzly bears in the lower 48. This is the regulatory framework under which all populations of grizzly bears in the lower 48 are currently managed. The 1993 Grizzly Bear Recovery Plan discusses the management regulations under 50 CFR 17.40(b) under ESA section 4(d) as "extensive" and makes no mention of ESA section 10(j) Nonessential Experimental Population status and doesn't suggest that agencies look to create other management frameworks beyond the plan. The section 4(d) regulations provide a proven management framework through which bears have been introduced to augment the struggling CYE populations as well as managing the highly successful Greater Yellowstone Ecosystem (GYE) population.

Management of grizzly bears in the currently inhabited areas with the special rule under section 4(d) has led to increasing and self-sustaining populations with at least some of the recovery criterion or objectives being met for three out of the four inhabited recovery areas. The GYE has met all current recovery targets, including population size, population distribution, and mortality rates. The Northern Continental Divide Ecosystem (NCDE) has also met all three of its current recovery targets for population distribution, mortality, and genetic connectivity. The Cabinet-Yaak Ecosystem has not met most of its recovery targets for population of females with cubs or population distribution, but has partially met the target for mortality (total mortality met, female mortality exceeded). However, augmentation of the bear population in the CYE has moved the ecosystem closer to meeting its targets. The Selkirk Ecosystem has not met its recovery targets for population of females with cubs, population distribution, and mortality. Despite not meeting these targets, the Selkirk Ecosystem still averaged an annual growth rate of 2.6% between 1983 and 2022.¹⁶ Overall, management through the special rule under ESA section 4(d) has contributed to the stabilization and growth of populations in the four inhabited Grizzly Bear Recovery Areas.

The stabilizing and slowly growing grizzly populations in these recovery zones can be partially attributed to the protected status they have as 'threatened' under ESA section 4(d). This 4(d) rule allows grizzly bears to be taken in limited circumstances as described below, as long as such take is reported promptly to the FWS. "Take" as defined under the ESA means to "harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct." Relevant takings language from the DEIS includes the following:

- Defense of life. Persons may take grizzly bears in self-defense or in defense of others.
- Federal, state, or Tribal scientific or research activities. Federal, state or Tribal authorities may take grizzly bears for scientific purposes, but only if such taking does not result in death or permanent injury to the bears involved. Such taking

must be reported.

- Removal of grizzly bears involved in conflicts. A grizzly bear constituting a demonstrable threat to human safety or to lawfully present livestock, guard dogs, crops, beehives, or other personal property, may be taken, up to and including lethal removal, but only if:

- It has not been reasonably possible to eliminate the threat or depredation by live capturing and releasing unharmed in a remote area the grizzly bear involved; and
- The taking is done in a humane manner by authorized federal, state, or Tribal authorities, and in accordance with current interagency guidelines covering the taking of grizzly bears involved in conflict.¹⁷

This framework allows for takings for necessary and practical reasons while maintaining the intent and integrity of ESA protections. Takings are permitted for self defense, research, or to remove bears involved in conflicts (such as conflicts with wildlife). Takings for self defense is currently a contentious issue, especially with the recent deaths of hikers in Banff National Park, in Canada, as well as other recent instances of human-bear conflict in the western United States. The standard 4(d) rule allows for takings, both in wounding to bears, through non-lethal defense mechanisms like bear spray, and lethal harm in self defense if necessary. Non-lethal takings for scientific purposes is also permitted, allowing researchers to learn more about the bears and their population through the early years of bear introductions to better inform adaptive management practices among other purposes. Non-lethal relocation and lethal removal are also permitted under the 4(d) rule for "a grizzly bear constituting a demonstrable threat to human safety or to lawfully present livestock."¹⁸ Considering the perceived and real threats that grizzly bears pose to livestock and crops within and in proximity to the NCE, the 4(d) rule offers options for relocating or removing nuisance bears or threatening bears. As these three areas are some of the largest areas of concern, the standard population framework allows for more than adequate takings already.

Additionally, the following "takings" allowance is included solely in the Alternative C takings section but should be listed under Alternative B as well. This bullet point is a component of the 4(d) takings allowance for 'defense of life,' but it is not elaborated on in the Alternative B discussion of the takings allowances as it in Alternative C:

- Deterrence for the purposes of avoiding human-bear conflicts or to discourage bears from using areas in the immediate vicinity of homes and other human-occupied areas. Any person who deters a grizzly bear must use discretion and act safely and responsibly in confronting grizzly bears involved in conflicts.

The FWS provides guidelines for safe and responsible hazing of grizzly bears.

See FWS Grizzly Bear Hazing Guidelines.¹⁹

The FWS Grizzly Bear Hazing Guidelines was written specifically for populations currently managed under the ESA section 4(d) special rule and therefore it would ostensibly apply to this proposed 4(d) management as well. By not including this additional detail on bear deterrence under the self-defense takings allowance for Alternative B as it is seen in Alternative C, this misleads the general public to think that this form of deterrence taking is not included in the self-defense takings clause.

As the ESA framework outlines, the purpose of "conservation" of endangered or threatened species is to work towards de-listing and management of the populations beyond the bounds of the ESA. Current management under the ESA section 4(d) special rule has demonstrated stabilization in slow growth in the four inhabited recovery zones, with two of the recovery zones meeting all recovery criteria. As this management strategy is a proven method for successful stabilization of populations and progress towards recovery in ecosystems throughout the American West, the restoration of a grizzly bear population in the NCE under the 4(d) rule has a strong chance of success in following these examples.

No Support for Action Alternative C or FWS Proposed Rule

Action Alternative C of the DEIS, which is also the basis of the FWS proposed rule, proposes to restore grizzly bears to the NCE using the same methods and parameters as Alternative B but under a different regulatory and management framework. Alternative C would designate the reintroduced population as a nonessential experimental population (NEP) under section 10(j) of the ESA. Section 10, Exceptions, discusses 'Experimental Populations': For purposes of this subsection, the term "experimental population" means any population (including any offspring arising solely therefrom) authorized by the Secretary for release under paragraph (2), but only when, and at such times as, the population is wholly separate geographically from nonexperimental populations of the same species... For the purposes of this Act, each member of an experimental population shall be treated as a threatened species; except that-- solely for purposes of section 7 (other than subsection (a)(1) thereof), an experimental population determined under subparagraph (B) to be not essential to the continued existence of a species shall be treated, except when it occurs in an area within the National Wildlife Refuge System or the National Park System, as a species proposed to be listed under section 4.20

Managing a grizzly population as a 10(j) Nonessential Experimental Population would offer some of the same protections as status as a threatened species but with a few key differences. These differences include a reduced requirement for agency consultation with FWS on federal action (still required on NPS lands), greater takings allowances, and the ability to manage the population as non-essential to the continued existence of an endangered species or a threatened species.

The FWS and NPS propose that "designation of grizzly bears released into the US portion of the NCE as a 10(j) NEP would provide authorized agencies with greater management flexibility should conflict situations arise."²¹ Greater management flexibility would primarily take the form of greater takings allowances as discussed in the DEIS. In addition to the 4(d) takings allowances for self-defense, federal, state, or Tribal scientific or research activities, and removal of grizzly bears involved in or threatening conflicts, the 10(j) rule allows additional takings based under three different management zones. The first management zone being mostly federal land within the NCE, zone 2 being some additional federal lands outside of the NCE, and zone 3 being all other lands all other lands not contained within management zones 1 and 2 within the NEP boundary. Notably, zone 3 lands include private lands within the NCE, the primary habitat area for the restored grizzly populations.

Zone 1 takings allowances in addition to those included in Alternative B are as follows:

Unintentional take of a grizzly bear, provided such take is non-negligent and incidental to an otherwise lawful activity, the take is promptly reported to the FWS, and if the take occurs on national forest lands, that the USFS has maintained its "no net loss of core" approach and implemented food storage restrictions throughout management zone.²²

Alternative C allows for greater takings than necessary within Zone 1 of the NCE. Necessary non-negligent takings should already be covered by the takings allowances outlined in Alternative B under the section 4(d) rule where takings for self-defense, scientific study, and conflict avoidance are already allowed. The agency should describe more specifically what an unintentional take that "is non-negligent and incidental to an otherwise lawful activity" but which doesn't fall into one of the three existing takings categories would be, and examine whether that form of takings can be allowed but still support the restoration of a healthy grizzly population in the NCE.

Zone 3 takings allowances in addition to those included in Alternative B and Zone 1 are as follows:

Preemptive relocation of any grizzly bear. With prior approval from FWS, federal, state, or Tribal authorities may live-capture any grizzly bear occurring in management zone 3 and relocate as a preemptive action to prevent a conflict that appears imminent or in attempt to break habituated behavior of bears lingering near human-occupied areas.

Conditioned lethal take. The FWS, or authorized agency may issue prior written authorization to any person to kill a grizzly bear in management zone 3 when necessary for public safety or to protect property, but only if:

- The FWS or authorized agency determines that a grizzly bear presents a demonstrable and ongoing threat to human safety or to lawfully present livestock, working dogs, domestic animals, crops, beehives, or other property; and it is not reasonably possible to otherwise eliminate the threat by live capturing and releasing the grizzly bear unharmed;
- Once the FWS or authorized agency determines the threat is no longer ongoing, the FWS or authorized agency would notify the person, terminating the authorization;
- The individuals requesting the written authorization are otherwise authorized by the landowner or land management entity;
- The taking is done in a humane manner; and
- The taking is reported to the FWS, and the carcass is surrendered to the FWS."²³

The basis of the additional Zone 3 takings allowance are not fundamentally different than takings allowed under the Alternative B ESA Section 4(d) management framework. Takings are allowed there for removal of "A grizzly bear constituting a demonstrable threat to human safety or to lawfully present livestock, guard dogs, crops, beehives, or other personal property." Similarly, lethal takings are allowed under 4(d) if "the taking is done in a humane manner by authorized federal, state, or Tribal authorities, and in accordance with current interagency guidelines covering the taking of grizzly bears involved in conflict." The only difference between these allowed takings being that under the 10(j) regulation the FWS could offer prior written authorization to a private individual to take a nuisance bear.

The additional takings allowances offered by the 10(j) proposed management are not substantively different from the takings allowed under 4(d) management with the exception that they may offer more opportunities for unnecessary takings of grizzly bears. 4(d) management offers all the same necessary takings allowances for self-defense, scientific study, and removal of nuisance bears without unnecessary takings exemptions that would threaten the long-term health and viability of what would be a fledgling population. The third and fourth statements of purpose and need for action for this DEIS are worth evaluating in the context of allowed takings found in Alternative C:

- Enhance the probability of long-term survival of grizzly bears in the NCE and thereby contribute to overall grizzly bear recovery through redundancy in multiple populations and representation in a variety of habitats.
- Support the recovery of the grizzly bear to the point where it can be removed from the Federal List of Endangered and Threatened Wildlife.²⁴

Considering that Alternative C offers more takings allowances for the grizzly beyond the practical and necessary allowances for self-defense, scientific research, and removal of nuisance bears, compared to Alternative B Alternative C does not "enhance the probability of long-term survival of grizzly bears in the NCE" or "support the recovery of the grizzly bear" to the point of delisting. Additionally, looking back on the goals of the ESA encapsulated in the definitions section, "The terms "conserve", "conserving", and "conservation" mean to use and the use of all methods and procedures which are necessary to bring any endangered species or threatened species to the point at which the measures provided pursuant to this Act are no longer necessary..."²⁵ Similarly to the Purpose and Need statement in this DEIS, it is unlikely that in comparison to Alternative B that Alternative C uses 'all methods and procedures' to ultimately

delist the species.

3) FWS Should Support Alternative B Over Alternative C, And Designate Critical Habitat for Grizzly Bears in the NCE

Background on Critical Habitat Designation

A "critical habitat" designation protects specific areas inside and outside the geographical region occupied by the threatened species if it is necessary for the conservation of the species.²⁶ Under ESA Sec 4 (3)(B), once a species is listed and a petition is filed, the agency is required to consider designation of the species' critical habitat within one year.²⁷ The Act states that "critical habitat may be established for those species now listed as threatened or endangered species for which no critical habitat has heretofore been established as set forth in subparagraph (A) of this paragraph."²⁸ Under §4(b)(2) of the ESA, the Secretary shall designate critical habitat: On the basis of the best scientific data available and after taking into consideration the economic impact, the impact on national security, and any other relevant impact, of specifying any particular area as critical habitat. The Secretary may exclude any area from critical habitat if he determines that the benefits of such exclusion outweigh the benefits [of the critical habitat] ... unless he determines, based on the best scientific and commercial data available, that the failure to designate such area as critical habitat will result in the extinction of the species concerned.²⁹

Section 7 of the ESA notably requires federal agencies to ensure that their actions are not likely to jeopardize the continued existence of a species or result in the destruction or adverse modification of the critical habitat of such species.³⁰

Concurrent with an agency's decision to list a species, the Secretary is required "to the maximum extent prudent and determinable" to issue regulations "designat[ing] any habitat of such species which is then considered to be critical habitat."³¹ The duty to designate critical habitat concurrently with a species listing was added to the ESA in 1978.³² Congress excused species that were already listed from this requirement, allowing designation of critical habitat, but not requiring it.³³ Grizzly bears were a previously listed species, and thus do not require listing of critical habitat.³⁴ Currently, USFWS lists 825 final critical habitats, with the grizzly bear noticeably absent.³⁵

FWS Has Continuously Failed to Designate Critical Habitat for Grizzly Bears, and Should Designate Critical Habitat in the NCE if it is Serious About Recovery

Under Alternative C, the Service's preferred alternative, FWS would designate grizzly bears in the US portion of the NCE and surrounding areas as a 10(j) nonessential experimental population (NEP) under section 10 of the ESA.³⁶ FWS claims that "designation of grizzly bears released into the US portion of the NCE, including their offspring, as a NEP would provide state, federal, and Tribal agencies with greater management flexibility should conflict situations arise."³⁷ As noted in FWS' related proposed rule on grizzly bear reintroduction, Section 10(j)(2)(C)(ii) of the ESA states that critical habitat shall not be designated for any experimental population that is determined to be nonessential, and accordingly FWS cannot designate critical habitat in areas where it establishes an NEP.³⁸ While designating critical habitat is barred in the NCE if the grizzly bear is reintroduced as an experimental population, under Alternative B, no such prohibition exists, and management would be consistent with existing ESA section 4(d) rules governing regulation of grizzly bears in the lower 48 states.³⁹ Designation of critical habitat

is an important step to species recovery that has continuously been neglected for grizzly bears for decades, and FWS should promote Alternative B, as this would allow the Service to designate critical habitat for grizzly bears in the NCE, which would be beneficial to their successful reintroduction to the area.

While the plan to reintroduce grizzly bears to the NCE is admirable in many respects, FWS' historic reluctance to designate critical habitat for grizzly bears appears to be at odds with the ESA's overarching goal of successfully recovering populations. The USFWS proposed critical habitat for the grizzly bear in 1976 but the designation was never finalized.⁴⁰ 47 years later, the agency still has not designated critical habitat for grizzly bears. While the recovery of grizzly bears in the NCDE and the GYE in the past few decades is a positive development, the fact that there is still no critical habitat designation puts the species' ability to fully recover and eventually be delisted in jeopardy.

FWS has undertaken previous efforts to establish areas for grizzly bear recoveries, including the nationwide Grizzly Bear Recovery Plan, which was finalized in 1982 and updated in 1993.⁴¹ A key part of this plan directed recovery efforts at establishing viable populations in six recovery areas in four states where the grizzly bear was known or believed to exist when listed in 1975 (including the NCE).⁴² The plan went as far as to outline criteria specific to each recovery zone to gauge grizzly bear recovery, including population size, sex ratio, number of females with cubs, mortality limits, and geographical distribution within the recovery zone.⁴³ Despite this extensive plan, FWS has limited recovery to the four ecosystems where grizzly bear populations survived when the species was first listed, and has never designated critical habitat in these areas. The Forest Service has also only enacted habitat protections, such as caps on road density, in national forests within the same four ecosystems.⁴⁴ FWS identified the NCE as one of the recovery zones under the plan, but has failed to take actions to restore populations in the area (outside of the current reintroduction plan). It is worth noting that the last confirmed sighting of a grizzly bear in the American portion of the NCE occurred in 1996.⁴⁵ FWS' failure to designate critical habitat in the NCE may not have led to the grizzly bear's extirpation in the area, but it also could not have helped. Recovery efforts are admirable, but recovery plans like the NCE grizzly restoration plan are a last gasp effort of sorts, which aim to bring back locally extinct species after the damage has been done. A wiser decision going forward for FWS would be to designate critical habitat for grizzly bears, which could eliminate the need for future reintroduction efforts.

In *Fund for Animals v. Babbitt*, FWS claimed before that critical habitat designation would be redundant, due to designated recovery zones that are comparable to critical habitat.⁴⁶ FWS also argued that critical habitat areas would likely be smaller than recovery zones and could harm grizzly bear populations more than it might help them.⁴⁷ The Service notably explained in *Babbitt* that its grizzly management regime had achieved social acceptance and that designating critical habitat could lead to a backlash that would jeopardize recovery.⁴⁸ This last argument seems to form the basis for much of FWS' grizzly management policy over the past few decades. FWS' choice not to designate critical habitat in *Babbitt* may have been partially based on science, but per FWS' own admission, it was also based on its perceived social acceptability. Much of FWS' current decision-making with regards to reintroducing grizzly bears as an NEP also appears to be based on social acceptability, as opposed to scientific evidence.⁴⁹ Ultimately, such a decision to not designate critical habitat may not be arbitrary or capricious, but it also appears to limit the potential for grizzly bear populations to successfully recover in a reasonable amount of time.

The NCE is an Ideal Location To Designate Critical Habitat for Grizzly Bears

Noah Greenwald, the director of the Endangered Species program at the Center for Biological Diversity, has noted that grizzly bears' "need for large undeveloped areas, wide distribution, and [their] danger to people make them one of the most difficult and contentious

species to recover under the ESA.⁵⁰ While these criteria may severely limit potential grizzly bear recovery areas, the NCE fits the bill and is an ideal location for critical habitat designation for grizzly bears. As noted in the DEIS, The NCE is comparable in size to Vermont and encompasses approximately 9,800 square miles, or 6.1 million acres.⁵¹ The recovery area is 85% federal land, 8% local lands (including state parks and Department of Natural Resources lands), and 7% private lands.⁵² Additionally, as seen below in Figure 1, portions of the NCE already serve as designated critical habitat for several species, including the Northern Spotted Owl, the Canada Lynx, the Bull Trout, and the Marbled Murrelet.⁵³ While none of these species has designated critical habitat that encompasses the entire NCE, collectively their critical habitats make up much of the area for proposed grizzly bear reintroduction. This is relevant information that FWS should have made available itself.

Figure 1. Northern Spotted Owl, Canada Lynx, Bull Trout, and Marbled Murrelet Critical Habitat in the Blue-Outlined NCE Area (Approximate)⁵⁴
[FIGURE PRESENT]

While FWS may claim that designating critical habitat would be redundant, as it is already planning on designating the NCE as a recovery zone for grizzly bears, it is important to highlight that consultation would not be required in much of the NCE, which could threaten the potential for grizzly bear recovery in the area. As the DEIS notes, Section 7 consultation provides valuable tools to conserve listed species, assist with species recovery, and help protect critical habitat, by mandating that all federal agencies consult with the FWS on proposed federal actions that may affect a listed species.⁵⁵ Consultation is required for any threatened or endangered species that could be affected by an agency's action, but is not required for designated 10(j) NEP populations, except where species are found in the national park system and national wildlife refuge system lands.⁵⁶ Within a national park system or wildlife refuge system lands, NEPs are treated as a threatened species for the purposes of consultation, and consultation requirements under section 7(a)(2) apply to these lands.⁵⁷ In the case of the NCE, the North Cascades National Park complex makes up 11% of the recovery area, and there are no national wildlife refuge system lands in the ecosystem.⁵⁸ This means that section 7 consultation would not be required in 89% of the designated recovery area in the NCE, which is troubling. Even if grizzly populations in the GYE and the NCDE were listed as 10(j) populations, they would still likely receive more protections than the proposed NCE population, as the GYE and the NCDE are both made up of a larger percentage of national parks than the NCE.⁵⁹ Many reasons have been spelled out for why critical habitat designation would be valuable for grizzly bears in the NCE, and this is yet another.

It is clear that FWS has the ability to designate critical habitat for threatened species when it desires to, begging the question why the Service refuses to do so for the grizzly bear. FWS shirks this duty by pointing to the grizzly bear's proposed status as a 10(j) nonessential experimental population (NEP), thereby abdicating its responsibility or ability to designate critical habitat. While the threat of conflict with bears is a real risk, education and programmatic opportunities could reduce such risks and negate the need for FWS to designate the bears as experimental populations. This could allow for critical habitat designation which would help population recovery in the long-term.

4) FWS Should Promote Educational Efforts That Inform Recreationists of the Dangers of Human-Bear Conflict, and Should Promote Programs to Support Ranchers

Background on Human-Grizzly Conflict

It is first worth mentioning that grizzly bear attacks on humans are rare, and fatal ones are even rarer, accounting for just 14% of attacks.⁶⁰ There is much news coverage of bear attacks, but in Yellowstone National Park, where one of the largest grizzly bear populations exists, a grizzly bear attack occurs once for every 2.7 million visits to the park.⁶¹ Additionally, as noted in the DEIS, the NCE's lower level of visitation than Yellowstone, and its lower population density of grizzly bears is expected to result in far fewer potential injuries and fatalities during both the primary and adaptive management phases.⁶² The reintroduction of a small number of grizzly bears to the NCE carries obvious risks, as there is ample opportunity for backcountry activities in areas where the bears will be reintroduced. However, through educational programming on human-bear coexistence and efforts to provide bear protection to recreationists, as well as creative concepts like compensation funds and the use of livestock guard dogs for ranchers, grizzly bears can successfully be reintroduced to the area with minimal issues.

The Threat of Human-Bear Conflict in the NCE is Slight

The proposed population of grizzly bears to be reintroduced to the NCE is small, and the threat of conflict to humans is minimal. The DEIS has a stated plan of releasing 3 to 7 bears per year at multiple sites over 5 to 10 years to achieve an initial population of 25 bears, with the hopes of achieving an eventual population of 200 bears in the next 60-100 years.⁶³ The CYE and Selkirk Ecosystem populations are useful comparisons of ecosystems with relatively small populations of grizzly bears, with 55-60 and 90-100 bears, respectively.⁶⁴ Combined, these two areas have bear populations that are roughly six times larger than the initial stated population of bears in the NCE, and have roughly $\frac{3}{4}$ of the desired long-term grizzly population of the NCE. As noted in the DEIS, there have been two human injuries caused by grizzly bears in the last 42 years in the CYE and Selkirk Ecosystem.⁶⁵ The threat of human-bear conflict in the NCE will not be pronounced, as the number of bears being introduced is so low to begin with. Despite the low likelihood of human-bear conflict, it is important that FWS educate visitors and locals on the risks of encountering grizzly bears.

Agencies Should Target Educational Efforts at Backcountry Recreationists

A major focus of FWS' public education efforts on grizzly bears should focus on backcountry hikers and campers. Risks are highest for visitors who explore the backcountry, with roughly one attack occurring for every 1.7 million overnight stays in the backcountry, and one for every 232,613 person travel days for hikes in the backcountry.⁶⁶ While still unlikely, an attack on hikers in the backcountry is approximately 255 times more likely than an attack on visitors who remain in developed areas of the national park.⁶⁷ As noted in the DEIS, there was a 29% increase in backcountry campers in the North Cascades National Park Service Complex in 2022, with 49,770 overnight backcountry stays recorded.⁶⁸ Taking the above human-bear conflict statistics into account, backcountry visitors are potentially the population most at risk of negative interactions with grizzly bears.

The DEIS has some language referring to requirements and educational efforts for backcountry users, but it mostly utilizes current NPS, USFS, and Washington State Department of Fish and Wildlife (WDFW) guidelines, with language like "current backcountry campground design protocols separating food preparation/storage areas from tent pads on NPS lands would continue to be implemented," and "the WDFW would continue its efforts to educate the public about proper sanitation, as well as other best management practices to reduce conflicts with bears and other wildlife."⁶⁹ This language lacks the specificity necessary for successfully educating backcountry users on the dangers of grizzly bears. One improvement for educating backcountry recreationists would be to require all members on a permit to attend an information session on bear safety from a ranger. While the DEIS notes that visitors obtaining permits for backcountry camping in North Cascades National Park receive information about food storage, safety, and wildlife concerns, including bears, as a part of the permitting process, it is not indicated how such information is conveyed to backcountry users.⁷⁰ A useful place to look for a successful

grizzly bear educational program for backcountry users is YNP.

YNP mandates in-person information sessions for backcountry campers.⁷¹ In such sessions, backpackers are given "face-to-face verbal information about bears and bear spray from the ranger issuing the permit... [and are] required to watch a safety video containing information on hiking and camping in bear country and how to use bear spray."⁷² While pamphlets and signage may be helpful tools for educating backcountry visitors about grizzly bears, social surveys indicate that YNP visitors retain verbal information better than written information from signs or brochures.⁷³ It would also be beneficial to extend these educational sessions to day-hikers, as studies from YNP indicate that only 13% of day hikers carried bear spray, when compared to 52% of backpackers.⁷⁴ The park hypothesizes that "since a permit is not required, day hikers may not receive verbal safety information from a park ranger, may not obtain published bear safety materials, and are not required to watch the safety video containing bear safety information."⁷⁵ Such efforts could and should be applied outside of the National Park area of the NCE as well, and relevant agencies and nonprofits could provide similar information sessions. While educational efforts may be costly, they would likely reduce the risk of human-bear conflict (thereby reducing the risk of human injury and bear euthanasia), and promote the successful reintroduction of grizzly bears to the NCE.

Agencies Should Make Bear Spray Available for Groups Recreating in the NCE, And Should Install Bear Wires At Campsites

State and Federal Agencies should sell, rent, or loan bear spray to individuals recreating in the NCE, and install bear wires at campgrounds. While the DEIS mentions increased public outreach and education efforts on the proper storage of attractants and the use of bear spray, there is no mention of agencies offering to furnish bear protection for hikers themselves.⁷⁶ The DEIS notes that bear canisters are available for loan at the Wilderness Information Center in North Cascades National Park, but there is no comparable program for bear spray or bear wires.⁷⁷ Such a program for bear spray already exists in YNP, where a concessionaire rents bear spray to individuals, and is advertised on the park's website.⁷⁸ Bear wires are also an inexpensive but helpful device for hanging food away from bears at campsites, and could be installed in campgrounds with relative ease. Despite this, North Cascades National Park has no plans to install bear wires for hanging food or to make any changes to existing frontcountry or backcountry campsites.⁷⁹ If a hiker or camper reads signs or brochures on the dangers of bears once he or she has arrived at the NCE, but has nowhere to purchase or rent bear spray, or fails to obtain a bear canister, then educational efforts by agencies may be somewhat futile. National parks often sell a plethora of memorabilia and food supplies to visitors, and extensively prepare campgrounds each year, so having them sell or rent critical bear protection, and install bear wires does not seem unreasonable. This could be accomplished by NPS, USFS, or through partnership with a nonprofit or private company.

Agencies Should Partner With Local Groups Already Focused on Human-Bear Coexistence

Educational outreach efforts may be a taxing and complicated task, but agencies within the NCE would not need to reinvent the wheel and wholly design new programs themselves, and could instead partner with local organizations that already have tailored programs promoting human-bear coexistence. The DEIS mentions that "ongoing public outreach by nonprofit organizations is also likely to continue, which would promote tolerance of and coexistence with grizzly bears."⁸⁰ While these groups are likely to continue their work, with or without the help of agencies, forming partnerships with such groups would go a long way in promoting the overall goal of successful reintroduction of grizzly bears to the NCE. For instance, Home Range Wildlife Research, a Washington based organization, already has a human-bear coexistence project, and WDFW is a partner.⁸¹ Having other agencies partner with local groups that already have active community ties and educational programs on human-bear coexistence could help agencies reach

a broader base, and successfully educate more people.

FWS Should Promote Compensation Programs and Non-Lethal Preventative Approaches for Ranchers to Counter Livestock Depredation by Bears

A major concern of reintroducing grizzly bears is their impact on cattle and sheep populations, and thereby the livelihood of ranchers. Such a concern appears to have played a major part in FWS' preference for a 10(j) status for the reintroduced grizzly bears, as the Service noted that such a 10(j) status would reduce the potential costs and the operational constraints "for impacted businesses such as ranches from the presence of grizzly bear[s]."82 It is worth noting that the DEIS predicts that only between 1 and 19 cattle, and between 1 and 4 sheep once the population hits the target quantity of 200 will be killed per year by grizzly bears, and that the number would likely fall on the lower end of the range, constituting less than 0.01% of the total cattle and sheep populations in the area.83 Despite these small numbers, any deaths to cattle caused by the reintroduction of grizzly bears should be taken seriously, and FWS should make efforts to ensure that Washington's compensation program for ranchers whose livestock are killed by bears is adequately funded.84

FWS should also promote non-lethal preventative approaches for ranchers to deal with grizzly bears, like the use of livestock guard dogs (LGDs). LGDs could be useful in the NCE for ranchers, as they have been shown to suppress sheep depredation by large and small predators including grizzly bears and gray wolves (which are also located in the NCE).85 Additionally, the use of LGDs allows producers to become actively involved in protecting their livestock and promotes a nonlethal method to aid the conservation of grizzly bears.86 FWS should promote the use of LGDs to known ranchers in the area and ask relevant state agencies to do the same.

Correspondence: I'm number 77. I reside in Whatcom and in Chelan Counties. I'm fortunate to live in both places. I want to thank first the Forest Service for giving us the opportunity to speak tonight. I want to speak because I'm in favor of restoration, and I wanted to say that I'm also in favor of the 10-J rule. And listening to the last comments about the 10-J rule, I also think that some of those additional protections for the grizzly bear are very important. I know that we've had other wildlife conflicts in the state, wolves in particular, that have had serious issues with conflicts with ranchers. And I think that we need to really think about how we're going to protect the bears in international habitat. And I think it's important to bring them back to the North Cascades. Thank you.

Correspondence: My name is [REDACTED], I'm a resident of Marblemount, creator, owner, and operator of Cascade Wagon Road Campground on the Cascade River Road. I, as well as a lot of others who are not brave enough to stand up in front of everybody tonight are against this. The number one question I get in 18 years of my campground from thousands of people, "Is there bears?" "Do we have to worry about bears?" "Is there grizzlies?" Constantly I get that.

My vote is for alternative A, no action. Leave it alone. If nature wants to have the bears back in, let it do it. I am one who has witnessed grizzlies in the last handful of years. I'll give you exact locations. County Line Creek where Skagit and Whatcom County come together.

I witness this year, this summer actually, an uncollared grizzly, mature, but not adult. Also, five years ago, similar bear, Big Foot Crossing area, at the bottom of Ruby Mountain. One I did not see myself but I'm going to try to come with a picture of it tomorrow to the Darrington meeting is at the top of the Lavit (phonetic) Creek Road.

So there are bears in the area. That presents another problem from what we want. We're not supposed to introduce bears if bears are currently here. So again, I support alternative A, no action. Thank you for your time.

Correspondence: I've been a long-time recreational user of the North Cascades ecosystem. I also - - since a teenager, actually, have lived and worked amongst grizzly bears, starting out as a teenager back in the 70s in Montana. That's over 45 years of being amongst grizzly bears, I've been away from them for a while, but I go back frequently with my wife and hike in Montana, probably 130 miles in the last few years.

And I say all of this because I am of firm belief that humans and grizzlies can get along together. I'm living proof of that personally. But I think all you have to do is look back to the - - to Montana, Idaho, Wyoming, and know that humans and grizzlies can coexist together.

Certainly, there are some issues, but those issues can be overcome and worked out. I encourage you, when you think about conflict with grizzlies, look at what's going on back in the Rockies and how they are managed there and doing there.

I'm a strong supporter of grizzly recovery here, in favor of alternative C. I cautiously support the 10-J rule, and I'll put forth some comments inviting some concerns with it. But I'm a strong supporter of grizzly recovery here. Thanks.

Correspondence: All right. We're meeting here today to discuss the federal government's plan to introduce the grizzly bear species into the Cascade Mountains, specifically to the area where (inaudible.)

The federal government and the experts sitting here before us as the representatives for this plan have stated on the record that this plan reintroduces the grizzly bear species back into its historic range and that its reintroduction would have a positive effect on the ecosystem in the areas of the state.

The question becomes, Are these statements true? Although it is true that the Cascade Mountains fall into the historical range of the grizzly bear species, it is absolutely false that the Cascade Mountains are the historical habitat of the grizzly bear species.

To understand the historical habitat of the grizzly bear species, we will have to understand the difference between the modern-day western region of what is now the United States and the region 200 years ago. Two hundred years ago the area that makes up the Western United States was sparsely inhabited by roaming nomadic tribes, and the vast majority of animal biomass was either in the flatlands, valleys and prairies, and our forests had an average of 65 trees per acre.

These flatlands, lowlands, or prairies is where the grizzly bear species historical habitat is. I hate public speaking. In the moderate age, it is in those flatlands, valleys, and prairies that we have built our farms, ranches, towns, and cities, forcing the bulk of animal species into the hills and mountain forests, which are steep, rough, broken places. And the forest averages anywhere from 165 to 600 trees per acre. These mountain areas 200 years ago were almost void of large animal life. I will give here a historical count of grizzly bear habitat and behavior.

This is a historical account from a fur trapper named Zenas Leonard. "The grizzly bear is the most ferocious animal that inhabits these prairies and are very numerous. They no sooner see you than they will make at you with open mouth. If they - -

if you stand still, they will come within two or three yards of you and stand upon their hind feet and look you in the face. If you have the fortitude enough to face them, they will turn and run off. But if you turn, they will most assuredly tear you to pieces, furnishing strong proof of the fact that no wild beast, however daring, is ferocious, unless wounded, will attack the face of man." Now if you want to hear an actual account from this area and give me the time, I will give it to you.

Received: Nov,27 2023

Correspondence Type: Transcript

Correspondence: My name is [REDACTED]. I live in Skagit County. As conservation chair for Skagit Audubon Society, I'm representing our 480 members who live in Skagit County.

Because we focus on protecting and restoring wildlife in its necessary habitat, restoration of the grizzly to the North Cascades is a cause we've supported for a very long time.

A number of our members, including myself, have lived, worked, hiked, and camped for years in grizzly country in Alaska, Wyoming, and Montana in areas where the density of the grizzly bear population is far higher than it will be in the North Cascades a century from now.

The National Parks Organic Act, the Wilderness Act, the Endangered Species Act will make restoring natural conditions an affirmative obligation of federal agencies. The grizzly was present in North Cascades for thousands of years and is only gone because of human actions.

It's our legal and ethical obligation to right that wrong, and Skagit Audubon supports doing so. We support alternative C with the accompanying 10-J rule. This approach to restoring grizzlies to the North Cascades is carefully planned, extremely gradual, and gives due consideration to local concerns.

We appreciate too that our spoken comments about potential impacts of helicopter use on spotted owls and marbled murrelets have been carefully addressed. We also appreciate the necessity of designating grizzlies brought to the North Cascades' ecosystem as a nonessential experimental population, and of devising the 10-J rule.

Our only concern is with the provision for livestock owners who claim losses from grizzly predation to be authorized to shoot the offending bear. Our confidence is not high that the correct bear and only that grizzly will be shot, and that any bear shot will be only wounded and then present a greater hazard.

Qualified agency biologists or other qualified employees should not only confirm the livestock loss, but also be the ones doing the lethal removal if that's determined to be the only acceptable course of action. Other than that, we support alternative C and the proposed 10-J rule. Thank you for your attention to our comments.

Correspondence: My name's [REDACTED] (phonetic.) I'm number 68. The - - I'm one of those that've also seen the grizzly up there last spring, working up on the pass, saw the - - saw the grizzly up at the county line road - - county - - county line between Skagit and Whatcom County, 145 East.

We have grizzlies here. We have them in a low enough population, they don't make an impact. We bring in a bunch of grizzlies, we will have an impact, just like the disaster of the wolves. When they brought them in here, we were sure that they're going to stay up there. They're not going to be down here. They were in Marblemount where I live, killing peoples' pets, killing peoples' livestock. Now they're not there anymore because people have shot them.

Those needed to go. And you guys brought them in, put them up there, they came down and caused a whole lot of problems. Grizzlies will do the same thing. I have (inaudible) where I take kids camping. When we're out, we never see a black bear because they hear the noise our kids make, and they go the other way. A grizzly gets curious. He'll come find out why. This is a dangerous thing, and it's unnecessary. Thanks.

Correspondence: Good evening. Thank you for hearing our concerns. I'm here to support the restoration of grizzlies in the North - - in the North Cascades. I also support plan C including the 10-J rule. I'm Judith Akins from Whatcom County. I just wanted to let you know that I had my first hike - - I went to Glacier National Park this year, this spring, and we got to watch grizzlies up in the mountains.

And one of the hikes we went on were - - a grizzly was present right before us because I got to put my foot in his footprint, and I felt pretty safe, you know. We had our bear spray, and we had - - there was plenty of people out there hiking, and we continued to talk and wander on the - -on the trail. So I felt pretty safe in doing all the things that we were supposed to do, and I'm here.

So grizzly bears roamed across the North Cascades for thousands of years as an essential part of the ecosystem. In the 20th century, however, people hunted, trapped, and poisoned them to near extinction.

Grizzlies are one of the slowest reproducing land mammals in North America, so the sooner we begin supporting their repopulation, the better chance they have - - will have of a long-term survival.

The latest review process was with the 10-J experimental population designation. According to you, the U.S. Fish and Wildlife Service, the designation for reintroduction of the species are - - offers flexible, less restrictive management by authorities and land owners, benefitting people, property, and bears.

Redesignation of the species in North Cascades as an experimental population will allow land managers to prevent conflict before it happens and address it when it happens. Reducing and addressing conflict will help bears bounce back and help people accept them to the landscape.

I just wanted to also, you know, hearing, and your excellent signs, you know, five bears within the next few years doesn't seem to me like we're reintroducing a whole lot of bears. So I just wanted to say that also.

The 10-J map imagines future expansion of the grizzly bear population into Zone 2. This expansion could contribute to the conservation of the species as a whole and potentially create connectivity between populations if more habitat is protected and quarters are developed.

Correspondence Type: Transcript

Correspondence: Hi. My name is [REDACTED], with the Endangered Species Coalition of the Pacific Northwest, representative, speaking on behalf of our 600,000 members across the U.S., our 10,000 members in Washington State, and our members that reside in this valley.

We would like to support alternative C and the 10-J rule. This alternative is in line with one of our great laws, the Endangered Species Act, which ensures recovery of threatened and endangered species. It will also bring recovery to one of our six ecosystems that need bears. Right now, four of them are occupied, and this needs to happen for the North Cascades. Grizzly bears and humans can coexist. If we look at the greater Yellowstone coalition where there's over a thousand bears and the Northern Rockies where there's over 1,000 bears, people coexist with the bears. We have seen ranchers. We have seen farmers. We have seen hikers. We have seen families coexist with these bears.

In these areas there's a robust economy with tourism, thousands of campgrounds in these areas that live with bears. Once again, please choose alternative C with the 10-J rule. Thank you for the U.S. Fish and Wildlife Service, thank you for the National Park Service, and thank you for Washington Department of Fish and Wildlife people are here tonight.

Correspondence: Number 79. Thanks so much to the National Park Service, U.S. Fish and Wildlife Service, and the land managers that are here considering grizzly bear restoration in the North Cascades National Park and surrounding ecosystem. My name's Graham Taylor, and I'm commenting on behalf of myself. I did bring a few props. I've been doing the grizzly bear tour this week to all the public meetings, and I've been talking with all the folks that I've been meeting with. And I met with the front-desk person in Omak, and she said she's for the bears, but she was working and couldn't go to the public meeting. I went and talked to the front-desk person at the - - the Concrete hotel I'm staying in, and he said he's for the bears, and he notes the park that brings up so much of the tourism and industry that benefits his business. We met at the Up River Grill & Taproom today, and the owner there said he opened especially just today so that my group could go there and eat because he - - as he said, is for the bears.

There are a lot of business owners in the community that are for the bears that aren't here tonight, and I really appreciate their support. You know, I've heard a lot about substantive comments and about some comments counting more than other comments, and I just really feel like we have a problem in this country right now counting all the votes properly and equally, which I think we should do, not that this is a voting process, but I did bring a document, and I'll submit this.

This is a FOIA request from the agency about what the comments looked like in 2017. How many people commented in support? How many people commented oppose. General support for grizzly restoration had 109,000 comments. The support for alternative A at the time had 1,300 comments.

So, you know, this is a wildly supported thing that the Park Service is trying to do. People like wildlife. People go to national parks to see wildlife, to experience wildlife, and they're some of the few places left on this planet and this country where people can go to see and experience wildlife or to know that wildlife is existing there. And I think it's important that we share the landscape of wildlife because if we don't, it's just going to be us. It's going to be a pretty lonely world out there. So please move forward with alternative C. Thanks.

Correspondence Type: Transcript

Correspondence: My number is 74. My name is [REDACTED]. I'm from Wenatchee. I strongly support the restoration of grizzly bears to the North Cascades. I believe this is the right thing to do for ecological, cultural, legal, and ethical reasons. But if we're going to do this, we need to do everything we can to proactively reduce human bear conflicts.

The good news is we know how to do this. In recent years, several programs have been developed to create what are usually called bear smart communities that address the root causes of human bear conflicts and reduce the risk to humans and private property.

Typically, these initiatives include local organizations, agencies, local jurisdictions, individuals, and businesses that work together to reduce and eliminate garbage and other attractants that so often lead to conflict.

Unfortunately, the saying, "A fed bear is a dead bear," is too often true. We have a clean slate in the North Cascades. There are no grizzly bears here now. I suggest that before any bears are brought into the North Cascades, we must have a well organized and well funded program to eliminate attractants that would get grizzly bears into trouble.

The National Park Service and the Forest Service have been putting in bear resistant trash bins and other infrastructure to manage garbage, but more needs to be done to eliminate attractants throughout the North Cascades grizzly recovery zone and in nearby areas managed by state agencies. And we need to find resources to help local communities become bear smart.

If we're going to bring grizzly bears back to the North Cascades, and I think we should not miss the opportunity to do that, then we must make sure that we're bringing them back to a place that is safe for bears and safe for people. Thank you.

Correspondence: Good evening. My name's [REDACTED]

[REDACTED] I'm number 82, and I live nearby here.

I'm a bear specialist and ecologist, and for the last 35 years or so I've worked all over the world on different bear populations, and it's been an amazing journey, and I like to share those stories through films and podcasts and in person. And for 25 years I've lived here in Washington State and spent a lot of time in the North Cascades, and searched for grizzly bears, and been a part of the whole process for many years.

There are - - I think what is lost sometimes is the fact that there are a lot of very smart scientists in this room that have been working on this issue for decades, for a long time, that have the background information and the scientific knowledge of these bears here and in other ecosystems.

For example, Wayne is here from Idaho, from Libby (phonetic) where they've routinely put grizzly bears into the - - restored grizzly bears there and put - - put grizzly bears into the backcountry without much fanfare. And so there's a lot of expertise in a room like this.

I'm here to voice my support for grizzly bear restoration alternative C and the 10-J rule. And I think it's a wonderful opportunity for Washington State to do something, thinking about the big picture. These bears are keystone species, indicator species, and an umbrella species. Globally we've lost 78 percent of wildlife population since 1970, and I'm 55 years old. That's my lifetime we've lost nearly two-thirds of the world's wildlife.

We have an opportunity in this wild, wonderful state to do something incredibly special, and as long as we all communicate about it and collaborate with it - - about it, I think it's a - - it should be looked at in that positive opportunity - - opportunity type way in a way that respects local people, all of the perspectives out there, the indigenous tribes that have called this home for thousands of years, and the many, many people that I've spoke to over the years who are doing outreach here that support grizzly bears whole heartedly.

Thank you for your time, and thanks to all of the agencies and indigenous representatives here, you know. We appreciate your time and work on this. Thank you.

Correspondence: My name's [REDACTED]. Some people might recognize that name as one of the founding citizens of the area. I grew up probably 10 to 20 miles from here, and I've recreated in the North Cascades for many decades. I won't get into how long that is.

I suspect with a greater than 50 percent possibility that I've seen a grizzly bear in the North Cascades roughly 15 years ago, but that's debatable. Of course, I wasn't close and did not feel threatened, however I think what this comes down to is a little bit more of a balance perspective from my part, and I'll be crude. I'll apologize in advance.

But I'll say that as long as sex is more popular than death, there's going to be more people, and those people have to live somewhere, and they want to play somewhere. And a lot of them want to play up here and camp up here, as do I. And so it comes down to me a question of conflict. And I relate that most closely to environmental justice, since I read that part of the EIS. I believe it's deficient because it did not address in this area of Whatcom County.

In fact, right now we are in part of Whatcom County, and so that's something that you should consider. The area of the North Cascades for most of my lifetime, early lifetime, a lot of the environmental economics was based on resource extraction. In fact, this area here, all that you see built here, is from resource exploitation that's funded that. That's dramatically decreased. Recreation cannot meet the same economic vitality of either environmental - - either of those two previous activities.

So I'd say in a twist of economic justice here, a balance - - I think that it's not going to bring in the search for Paddington Bear, the nice bear that's going to live next door to you is not going to do it. So I fall back to economic justice. I believe your analysis is deficient.

And I want to make one more comment in here that people should realize that if you comment on one, you should comment on both. The comments are not going to be comingled and shared between the 10-J and the guidance. So thank you for your time. Recreate safely out there, please.

Correspondence: Yeah. It's [REDACTED] and my comment is I live in Marblemount. I live on the river. My concern is that any grizzly bears introduced to the areas - - area will migrate down to Marblemount because the fishing is better down there, and I think grizzlies like to fish. And my concern is I'll find a grizzly in my backyard, and I'm afraid of that. So I'm against this, and I'm against it just on the basis of I think the Forest Service or the Park Service should - -should leave the park as is and let it do what it - - what it's going to do. And that's pretty well it.

Correspondence: RE: Endangered and Threatened Wildlife and Plants; Establishment of a Nonessential Experimental Population of Grizzly Bear in the North Cascades Ecosystem, Washington State

To whom it may concern,

The USFWS preferred alternative is to introduce a non-essential population of bears into the NCE which acknowledges the fact that such a population is not essential for the continued existence of an endangered or threatened species.¹ On this basis, alternative B is an illegitimate action for USFWS to pursue because it is not essential for the recovery of the animal. Furthermore, the NCE is not geographically distinct from the Kettle-Granby and Stein-Nahatlatch Grizzly Populations in Canada. This makes preferred alternative C to introduce an experimental population into the NCE illegitimate by violating clear language in the ESA at 16 U.S.C. 1539 SEC. 10(j)(2). On this basis, the only lawful and appropriate action is no action.

Introductory Statements:

- There is no legitimate procedural pathway for artificial Grizzly bear recovery in the North Cascades Ecosystem (NCE).
- Federal agencies governing by executive edict are systemically resulting in statutory obligations being ignored by agencies resulting in greater regulatory burdens and unfunded mandates on small entities than necessitated by statute.²
- The Department of Interior (DOI) failed to publish this rule in its semiannual Regulatory Flexibility Agenda as required by the Regulatory Flexibility Act and Executive Order

12866. (Sec. 2)

- The proposed rule poses significant federalism implications which have not been thoroughly addressed.
- Grizzly bear recovery efforts in the NCE have a high likelihood of cumulatively imposing mandates in a manner that may displace other essential local governmental priorities.³
- It is inappropriate for the Federal/State agencies or Environmental NGOs to introduce or incentivize the dispersal of grizzly bears into any part of Washington state, particularly outside the NCE ecosystem where natural connectivity is lacking, and increased human conflict is imminent.
- The DEIS fails to adequately assess impacts on land inholdings and valid existing rights within and adjacent to the NCE as documented and requested within prior scoping documentation.⁴ (see attachment 1)
- The DEIS focuses on the impacts relating to the introductory phase and federal costs and fails to evaluate the socioeconomic costs during the post-introductory phase as bear populations grow and disperse out of the designated recovery zone.
- Introduction of zones 2 and 3 are not in the original scoping process and the effort failed to hold public meetings in those areas in the scoping process and assessment of impacts which statutorily violates the NEPA scoping process and invalidates the resulting Draft Grizzly Bear Recovery Plan and EIS.

1. Socio-economic impacts on the human environment

Studies in other states have shown that costs associated with effective mitigation of bear dispersion outside of recovery zones into unwanted regions could be roughly 1/3 the cost in comparison to the impacts and costs on the human environment associated with uncontrolled bear dispersion/presence.⁵

If bears were present in the North Cascade Ecosystem (NCE) and dispersed outside the NCE recovery zone, the mitigation should be directed at the bears, primarily by relocating the bear into the appropriate recovery zones, or in the case of a bear attacking and/or killing livestock or a person the bear should be killed.

USFWS signifies bears will be tolerated dispersing outside the NCE insofar as they remain conflict-free. This view fails to understand the fact that even where depredation is not occurring the presence of apex predators within the vicinity of confined domestic livestock grazing allotments induces stress on cattle contributing to unfavorable grazing conditions, poor nutrition, and higher risk of disease.⁶ The bottom line is that the presence of Grizzly bears around cattle even when not depredating can contribute to net losses for domestic livestock producers and agencies need to account for these losses.

As evidenced in Montana and Wyoming management within recovery zones has predominately focused on mitigating the human environment by mitigating human recreational and productive activities such as hunting, fishing, domestic livestock grazing, and roads.⁷ These impacts need to be further assessed relating to bear management within the NCE recovery zone to thoroughly balance the needs of the human environment with the natural environment.

Grizzly restoration in the GYE and NCDE demonstrates that these bears are both unpredictable and uncontrollable. Despite the vast resources spent on precautionary measures to reduce conflict, interactions between grizzlies and humans are documented to be increasing across the range, with an associated level of human mortality. Agency miscalculations and bias against the human environment have allowed the U. arctos population to expand and disperse unchecked across a 15,000 square mile area outside of the 9,600 square mile NCDE recovery area.⁸ Instead of mitigating bear dispersion and protecting domestic sheep grazing allotments from depredation within USFS rangelands and NPS systems, domestic sheep allotments are being phased out.⁹ The general conclusion of the DEIS regarding the NCE is that an increase in grizzly bear population correlates with increased potential for bear-human conflict. As the bear population increases or a bear decides to wander into the Range of Influence outside NCE into human

population areas or intersect with human use of natural resources bear-human conflict will also increase. Analysis in the present DEIS first covers the impact within the NCE and then the 7 counties that fall within the boundaries of the NCE. This range of influence also includes the gateway communities located within 20 miles of a park.¹⁰ The ROI of the NCE is isolated from larger urban centers and exists predominately in rural areas. The primary emphasis for analysis of socioeconomic impacts is on the introductory phase which establishes the 25 initial bears to be introduced into the NCE. Predictions and assessments once the grizzly bears move outside of the NCE are described in general terms.¹¹

The tone of the analysis minimizes these impacts. For example, the gateway communities have a history of tourism. Originally many of these communities relied on agriculture, timber, and mining, but have turned to tourism due to the fact the historic industries are less lucrative or available. Tourism spending associated with outdoor recreation on public lands currently supports the majority of local jobs and income in the ROI. The net cash income from farm operations in ROI is approximately half the cash farm income in the state of Washington. Timber harvest is in general decline. However, no mention is made of environmental activism which has pushed for limiting commercial activity such as mining, timber harvest, and grazing over the desire to have pristine untouched ecosystems and the associated wilderness experience. This was often achieved by identifying and listing species of concern as threatened or endangered such as the spotted owl which also created restrictions on commercial timber activity on public lands. Similarly listed anadromous fish are now creating controversy over the availability of water.

These factors are seen as a plus that support tourism in the NCE with enhanced participation of anglers and hunters since the presence of grizzly bears has not harmed the sustained participation in states like Wyoming and Montana. However, Washington state has seen the opposite. Due to the listing of the Grey Wolf as endangered, there has been a decline in available game such as mule deer and many streams and rivers have closures due to the listing of Steelhead and Chinook salmon as threatened or endangered under the ESA. The addition of another apex predator, the grizzly bear, will contribute to further access limits to the principal uses: recreation, timber, grazing, minerals, functioning watersheds, and wildlife and fish under the Federal Land Planning Management Act.

In regions 1 and 6 (Okanogan County and Pend Oreille County) USFS is managing habitat to support grizzly bears. This means that forest treatment to prevent wildfire is not permitted. Gate closures related to this habitat preservation are creating problems with illegal entry. The closures prevent forest harvest and wildfire management treatment. Any project to harvest timber in national forests is in jeopardy for implementation whether harvest is for wildfire mitigation or a timber sale. Every forest service project faces these restrictions if it involves activity on grizzly bear habitat¹².

The initiation of the 10j non-essential population will create such restrictions. The EIS must identify and articulate these impacts, the loss of revenue, access to forests, and the inability to mitigate wildfire.

Economic impacts of depredation, agricultural damages, and the general human environment are not adequately considered. Only the costs of DEIS implementation to the Services are considered in Appendix C. The primary considerations in the DEIS focus on the introductory phase and do not evaluate the effects once population goals are reached in the NCE and bears begin dispersing into zones 2 and 3 as well as the ROI around the NCE. Bears from the North Continental Divide Ecosystem and the Greater Yellowstone Ecosystem have exceeded their restoration goals and are leaking outside their recovery zones into areas of human development and agricultural use of land. These factors should provide the data for economic and human-bear conflicts from bears migrating into the human environment. Without these long-term costs and a liability vs benefit analysis, the DEIS is not forthcoming with the public regarding their costs for mitigating attractants, fencing, and other defense mechanisms against bear actions. The extent of human presence and the presence of rural economics should be a factor in not introducing an apex predator like the grizzly bear. The ESA in this sense becomes an instrument to mitigate the people and limit their economic viability which can push people to leave rural areas, which has happened as economic opportunities are reduced.¹³

These effects were not considered for zones 2 and 3 and failed to include the people in those areas in the commenting process and assessment of impacts. This factor including the fact that the designated recovery zone should only be the NCE contributes to the inadequacies of the present DEIS.

2. Federalism implications

When federal actions impose costs and budgetary impacts on local governments and the private sector, those impacts must be assessed and accounted for, ensuring special consideration to small governments and private sector interests in federal regulatory actions. The Unfunded Mandates Reform Act specifically addresses this with the purpose to assist Federal agencies in their consideration of proposed regulatory actions by,

"Requiring that Federal agencies prepare and consider estimates of the budgetary impact of regulations containing Federal mandates upon State, local, and tribal governments and the private sector before adopting such regulations, and ensuring that small governments are given special consideration in that process"¹⁴

The termination of the former EIS and associated recovery plan by Secretary of Interior Bernhardt and the decision for the agencies to no longer pursue recovery of grizzly bears into the NCE was based on such special consideration of the input from local governments and considerable public opposition to such actions.¹⁵ This administration reinitiating these recovery plans and associated impacts analysis is forcing local governments, associations, and private sector interests to reallocate time and resources to address regulatory actions that were already thoroughly addressed and rightfully terminated by the federal government in response to opposition and input provided in the official record.¹⁶

These actions have a high likelihood of cumulatively imposing mandates in a manner that may displace other essential local governmental priorities.¹⁷ The Small Business Regulatory Enforcement and Fairness Act (SBREFA) amended the Regulatory Flexibility Act to require federal agencies to provide a statement of the factual basis for certifying that a rule will not have a significant economic impact on a substantial number of small entities. The SBREFA was passed in the context of Congress finding that:

"a vibrant and growing small business sector is critical to creating jobs in a dynamic economy" 5 USC 601 note Sec. 202 findings (1)

And that,

". . .small businesses bear a disproportionate share of regulatory costs and burdens. . ." 5 USC 601 note Sec. 202 findings (2).

Federal agencies governing by executive edict are systemically resulting in statutory obligations being ignored by agencies resulting in greater regulatory burdens and unfunded mandates on small entities than necessitated by statute.¹⁸ The Department of Interior (DOI) failed to publish this rule in its semiannual Regulatory Flexibility Agenda as required by the Regulatory Flexibility Act and Executive Order 12866.

Executive Order 13132 was issued to guarantee the division of governmental responsibilities between the national government and the States intended by the Framers of the Constitution, ensuring that the principles of federalism established by the Framers guide the executive departments and agencies in the formulation and implementation of policies, and to further the policies of the Unfunded Mandates Reform Act. Section 1 of this order defines "Policies that have federalism implications" and refers to:

"Regulations, legislative comments or proposed legislation, and other policy statements or actions that have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government."

The current rule under this definition poses significant federalism implications which is evidenced by like-kind issues being faced with such distribution of powers and responsibilities of various levels of government in Montana, Idaho, and Wyoming. EO 13132 clarifies fundamental

federalism principles stating:

"The people of the States created the national government and delegated to it enumerated governmental powers. All other sovereign powers, save those expressly prohibited the States by the Constitution, are reserved to the States or to the people."

And that,

"The constitutional relationship among sovereign governments, State and national, is inherent in the very structure of the Constitution and is formalized in and protected by the Tenth Amendment to the Constitution."

The EO further establishes federalism policymaking criteria stating,

"There shall be strict adherence to constitutional principles. Agencies shall closely examine the constitutional and statutory authority supporting any action that would limit the policymaking discretion of the States and shall carefully assess the necessity for such action."¹⁹

DOI and USFWS have failed to adhere and comply with clear statutory obligations in the Regulatory Flexibility Act, Unfunded Mandates Reform Act, Small Business Regulatory Enforcement Act, and Executive Order 12866, 13132, posing significant federalism implications which have not been thoroughly addressed.

Local Police Power and Protection of Private Property

We contend that nothing in the ESA, insofar as it is according to the limited and enumerated powers within the US Constitution, can supersede or impede the unenumerated reserved powers of state and local governments under the 9th and 10th amendments which are best positioned to protect the inviolable rights of the person in his life, liberty, and property.²⁰ This is especially true in relationship to apex predators straying outside of their recovery ecosystems and intruding into privately owned agricultural lands.

Public health and safety falls under the police powers of state and local governments. The doctrine of *in para materia* requires that all like-kind statutes are to be interpreted as a whole. "Statutes" Justice Frankfurter once wrote, "cannot be read intelligently if the eye is closed to considerations evidenced in affiliated statutes."²¹

"State governments have the authority and responsibility to protect the public health, safety, and welfare. This authority is an inherent attribute of State governmental sovereignty and is shared with local governments" "... Substantive due process is the constitutional doctrine that legislation must be fair and reasonable in content and designed so that it furthers a legitimate governmental objective. The doctrine of substantive due process is based on the recognition that the social compact upon which our government is founded provides protections beyond those that are expressly stated in the U.S. Constitution against the flagrant abuse of government power. *Calder v Bull*, 3 U.S. 386 (1798)."²²

Federal land use statutes²³ also reinforce the principle that police power is reserved to the State and local governments. Title 7 of the Federal Land Policy and Management Act (FLPMA)²⁴ at 43 U.S.C. 1701, note(g)(6) states that "Nothing in this Act shall be construed as limiting or restricting the power and authority of the United States or - (6) as a limitation upon any State criminal statute or upon the police power of the respective States, or as derogating the authority of a local police officer in the performance of his duties ... on the national resource lands."²⁵

3. 10(j) Non-essential Population of Grizzly Bears in the NCE and Associated Management Zones:

The USFWS's preferred alternative is to introduce a non-essential population of bears into the NCE which acknowledges the fact that such a population is not essential for the continued existence of

an endangered or threatened species.²⁶ On this basis, alternative B is an illegitimate action for USFWS to pursue because it is not essential for the recovery of the animal. Furthermore, the NCE is not geographically distinct from the Kettle-Granby and Stein-Nahatlatch Grizzly Populations in Canada. This makes preferred alternative C to introduce an experimental population into the NCE illegitimate by violating clear language in the ESA at 16 U.S.C. 1539 SEC. 10(j)(2). On this basis, the only lawful and appropriate action is no action.

The USFWS acknowledges that NEPs are to be geographically distinct from nonexperimental populations of bears under 50 CFR 17.80.²⁷ This section emphasizes the separation of experimental populations from nonexperimental populations in the lower 48 states but says nothing of the Grizzly Bear Population Unit in British Columbia which is geographically connected with the Washington state NCE recovery area which poses statutory (16 U.S.C. 1539 SEC. 10(j)(2)) non-compliance issues with an experimental population of bears in the NCE.

The DEIS specifically states:

"FWS considered separation of the NEP from other nonexperimental populations of grizzly bears within the lower 48 states as necessary under FWS regulations (50 CFR 17.80). This separation of experimental and nonexperimental populations helps ensure that extant populations retain their protections under the ESA and that the regulations that apply to each population are clearly defined." DEIS p. 36

The USFWS goes from here to proposing management zones 1, 2, and 3. As seen in the map below, zone 1 is the primary recovery zone within the NCE. Management zone 2 is "meant to accommodate natural movement or dispersal by grizzly bears" southward through Pierce, Lewis, Yakima, Skamania, and Klickitat counties. This includes areas that butt up with the Oregon state border. Also, eastern Okanogan and Ferry counties contain portions of Zone 2. Management Zone 3 encompasses the entirety of the state except the northeastern corner. The DEIS states "grizzly bears may occur in portions of this zone." The zone is intended to provide broader management capabilities but inappropriately allows for bears to disperse and reside within the zone.

Figure 4: Alternative C Management Zones
[FIGURED ATTACHED]

The Draft EIS as shown in the map above designates virtually the whole State of Washington as a 10(j) non-essential population habitat for Grizzly bears. Yet despite this, the present DEIS confines its analysis to the North Cascades Ecosystem:

"This chapter describes the current and future conditions for those elements of the human environment (physical, natural, cultural, and socioeconomic) that would be affected by implementing the actions considered in this North Cascades Ecosystem Grizzly Bear Restoration Plan / Environmental Impact Statement (plan/EIS). Grizzly bear restoration actions proposed in this plan/EIS would be applied within the roughly 6.1-million-acre North Cascades Ecosystem (NCE) grizzly bear recovery zone as described in the NCE chapter of the US Fish and Wildlife Service (FWS) Grizzly Bear Recovery Plan (FWS 1997)."²⁸

Qualifications for recovery include a sustainable population that is able to offset some level of human-induced mortality and influences of demographic and environmental variation and reproducing bears are distributed throughout the recovery area²⁹. In this DEIS zone 1 is stated to serve as the core habitat for survival, reproduction, and disposal. As stated Zones 2 & 3 are considered dispersal zones with consideration that Zone 3 has well-developed human activity but some areas may provide habitat for the grizzly bear.

One significant problem with these planning zones is the failure to disclose these in the original scoping document resulting in misleading people to think the NCE is the recovery zone. It also contradicts the Grizzly Bear Recovery Program Report, 2022. In addition, the present DEIS is invalid for including this material without proper scoping, preparing the public, and limiting the current comment process only to the communities around the NCE. People, businesses, and communities in zones 2 and 3 were not adequately included in the current planning attempt to develop a Restoration Plan and associated DEIS, such as hosting public meetings in these regions.

The present DEIS is a statutory violation of the NEPA process. The current Restoration Plan / DEIS exceeds the intent noted in the 2022 Grizzly Bear Report where the NCE is discussed as the only recovery zone in the state of Washington. Therefore, any future planning must confine all recovery attempts to the NCE with a definition of the sustainable population for the NCE only. Allowing for the dispersal and occupancy of bears outside the NCE into zones 2 and 3 should not be permitted in any restoration efforts.

4. Southern Washington and Oregon are not documented by USFWS Grizzly Recovery Plans as an ecosystem and are therefore not a recovery zone for Grizzly Bears

The DEIS already falls significantly short of assessing impacts on land inholdings and valid existing rights within and adjacent to the NCE as documented and requested within prior scoping documentation.³⁰ The inclusion of zones 2 and 3 which presumably allows dispersion and occupancy of grizzly bears southward and eastward, broadens cumulative and indirect impacts to at least 6 other counties outside and beyond adjacency to the NCE ecosystem which has not been quantified and assessed in a cost-benefit context.

USFWS has longstanding maps of 6 grizzly bear ecosystems³¹ which do not include southern Washington or Oregon. There is no population of bears South of the NCE region and therefore no basis for connectivity. Furthermore, not being within an established ecosystem/recovery zone, there is no basis for managing habitat for grizzly bears. Zone 2 south of the NCE is inappropriate and exceeds USFWS regional responsibilities for the recovery of grizzlies.

[FIGURE HERE]

Further, because Experimental populations must be geographically distinct from non-experimental populations of bears, zone 2 east of the NCE is also inappropriate for USFWS to prioritize and allow dispersion and occupancy of bears within this region. We strongly oppose any permits, proposals, or other efforts by Federal/State agencies or Environmental NGOs to introduce or incentivize the dispersal of grizzly bears into any part of Washington state, particularly outside the NCE ecosystem. There should be no distributional objectives outside the NCE where natural connectivity is lacking, and increased human conflict is eminent.

5. ESA considerations

As stated, the preferred alternative for an experimental population acknowledges this process is not necessary for the recovery or conservation of the species. USFWS has no justifiable basis to introduce grizzlies into the NCE itself, let alone allow for dispersal and occupancy of zones far outside the recovery zone. The ESA does not provide a rational basis for allowing dispersion of dangerous apex predators outside of recovery zones into unwanted regions especially when conditions for recovery of the species have already been met.

If a species is stable throughout a significant portion of its range, agencies have no rationale under the ESA to allow the dispersion and/or introduction of any dangerous species into a region not classified as an ecosystem, and therefore not a recovery zone for the species.

Endangered Species are defined in the ESA as:

The term "endangered species" means any species which is in danger of extinction throughout all or a significant portion of its range other than a species of the Class Insecta determined by the Secretary to constitute a pest whose protection under the provisions of this Act would present an overwhelming and overriding risk to man.

Threatened Species are defined in the ESA as:

The term "threatened species" means any species which is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range.

The potential loss of human life, livestock depredation, and increased regulatory costs to local governments are exacerbated by what is an unnecessary introduction of an apex predatory species.

6. Conclusion

There is insufficient rationale for initiating a new scoping process and the resulting Draft

Restoration Plan and EIS. The Secretary of the Interior, David Bernhardt terminated the EIS process for restoring grizzly bears in the NCE32 due to the socioeconomic impacts and local response to the introduction. The DEIS provides no new scientific information that contradicts previous comments that the grizzly bear should be delisted. The non-essential experimental population, preferred alternative C tacitly admits that the introduction of the U. arctos into the NCE is not necessary for the survival of the species.

The main rationale of the DEIS is to offer the 10(j) non-essential experimental population as a means to address objections and concerns people have about bear management, especially in situations involving bear-human interactions. However, a comparison of the two management options reveals a common problem: the private property owner, rancher, farmer, individual or business must experience the conflict, threat, depredation, and property damage before action is taken. Action taken is also predicated on proper deterrence or removal of attractants and protection of livestock through electrified fencing. The DEIS does not adequately account for such socioeconomic impacts and costs. This criticism is exasperated due to the expanded recovery-dispersion zones 2 and 3. The NPS and FWS will be recreating the situations that led to the diminishment and extirpation of the Grizzly Bear while expecting the human population to live with these circumstances.

Based on issues and conflicts identified in these comments, initial scoping comments, and substantive comments on the former DEIS we strongly recommend the no action alternative A. We appreciate the opportunity to inform this process and hope to see USFWS responsive to our concerns and recommendations.

Attachment I
Table Identifying Inadequate Response to Scoping Comments

1)

Issue:

USFWS proceeded with NCE Grizzly bear introduction process without responding to State petitions to delist. USFWS was 7 months late in meeting statutory response requirements to 3 state petitions to delist the Grizzly bear under the ESA. USFWS rejected Idaho's petition to delist the bear in the lower 48 states and is now proceeding to establish an experimental population of Grizzlies into the NCE.

Statement:

On December 17, 2021 The Governor of Montana issued a petition to FWS to delist the distinct population segment of U. arctos in NCDE

On January 10, 2022 the State of Wyoming issued a similar petition to delist U. arctos in the GYE

On March 9, 2022 the State of Idaho issued a petition to delist U. arctos across the Lower 48 United States

Idaho on November 17, 2022 issued a letter to Martha Williams of FWS urging the timely processing of their petition and meet the 90 day deadline.

USFWS responded Feb. 6th 2023 and will consider Montana and Wyoming petitions but rejected the Idaho petition.

"The response is seven months late, and it took a threat of legal action from the State of Idaho to simply receive a response," Governor Little said in a prepared statement. "While we continue to evaluate the decision from (the U.S. Fish and Wildlife Service), this is another example of federal overreach and appears to have a disproportionate impact on North Idaho."

2)

Issue:

The 10j experimental population is
inappropriate and fails to meet
procedural requirements.

Statement:

The ESA does not provide a rational basis for the introduction of *U. arctos* into the NCE when the conditions for recovery are met, as the present species is stable throughout a significant portion of its range.

10(j) process may only be used when the proposed 10(j) experimental population would be geographically isolated from existing populations. The WA NCE is not geographically distinct from Grizzly Bear Population Units in British Columbia. The Secretary of the Interior has not adequately determined through regulatory processes that an experimental population would further conservation of the species.

There is no evidence in the public record that the NCE proposal would significantly further the conservation of *U. arctos*. (No new data or science is noted in the Federal Register notice from the two years since the former EIS was terminated).

3)

Issue:

The proposal conflicts with recreational access such as the Pacific Northwest National Scenic Trail.

Further the proposal will adversely impact most recreational pursuits in the NCE once a population of bears is established.

Statement:

The issue is recreational user safety as the trail bisects the NCE and associated federal lands.

USFWS in the Draft EIS propose permitting recreational uses in the NCE to mitigate potential human bear conflict. But the administrative costs and impacts on the thousands of recreational pursuits into the NCE is not adequately assessed. Such permitting requirements would inhibit public access and significantly increase costs and personnel of the agency tasked with permitting.

- - -

5)

Issue:

NEPA considerations are insufficient
The DEIS acknowledges that human bear "encounters" will likely increase and deter some people from recreating but fails to take a hard look at the nature of these encounters and to assess costs and impacts to the human environment including the inestimable cost of human life and safety (evidenced by issues faced in Idaho, Montana, Wyoming and portions of Canada).

Statement:

The actual introduction of grizzly bears into the NCE will have indefinite cumulative effects. The Agencies have focused on unlikely impacts during the introductory phase, but has not done due diligence on the secondary phase when bears populate and disperse within and outside of the NCE recovery zone. Analysis must include all impacts that will likely occur in the future and impacts on the human environment must be interpreted and assessed comprehensively.

Reference:

A central purpose of an EIS is lost "if consideration of the cumulative effects of successive interdependent steps is delayed until the first step has already been taken." *Thomas v. Peterson*, 753 F.2d 754,761 (9th Cir. 1984).

See - J.R. Carlson at. el. - A Statutory, Policy and Technical Analysis and Alternatives for Inclusion in the Scoping and EIS North Cascades Ecosystem Grizzly Bear Restoration Plan - (Dec. 13th, 2022) p. 11, 12, Attachment A, and Attachment B Fatal Grizzly Bear Attacks on Humans in North America 2010 - 2022

6)

Issue:

The NCDE is a comparative recovery zone to the NCE. It appears USFWS failed to utilize actual data from the

NCDE to assess the cumulative and indirect impacts that result when bear populations and dispersion increase. Agency predictive methodologies have been unreliable for these purposes and have allowed extensive population and dispersion rates way outside of initial recovery areas.

Statement:

The NCDE foretell multiple layers of regulation for the public around the NCE who will be liable for fines and penalties if found in noncompliance in responding to bear problems. Even if ESA protection are absent, the regulatory mechanism and conservation framework will continue. The cost for these controls must be quantified for the NCE.

Grizzly restoration in the GYE and NCDE demonstrates that U. arctos is both unpredictable and uncontrollable. Despite the vast resources spent on precautionary measures to reduce human/bear conflict, interactions between U. arctos and humans is on the increase, with an associated level of human mortality.

Reference:

See - J.R. Carlson at. el. - A Statutory, Policy and Technical Analysis and Alternatives for Inclusion in the Scoping and EIS North Cascades Ecosystem Grizzly Bear Restoration Plan - (Dec. 13th, 2022) p. 13, 14, and Attachment B. Bear Biologist [REDACTED] says grizzlies have nearly doubled their original range in the NCDE, and expanded faster than FWP predictions, leading to an increase in livestock depredations along the eastern edge of the ecosystem. The estimated occupied range for the NCDE grizzly bear population is almost 25,000 square miles, which is a 42% increase from what was estimated in 2004, and it's a 25% increase from what was estimated in 2010. Montana Wool Growers Want More Funding For Livestock Depredation Investigations / Montana Public Radio (mtpr.org)

- - -

7)

Issue:

Depredation and bear presence will have Socioeconomic Impact that must be addressed:

- a. Flawed Predictive Models
- b. The Taxpayer will bear the burdens from depredation.
- c. Takings implications

- d. Public Health and safety
- e. There are significant inholdings and lands within the NCE.

Statement:

a. FWS predictive models for bear reproduction and dispersion rated far exceeded projection in GYE and NCDE. In contrast the preference for seclusion and the measures to reduce contact and interactions with humans, the bears area both unpredictable and uncontrollable. The concept that NCE bears will be less carnivorous than GYE grizzlies due to feeding habits will translate into less depredation is blue sky reasoning. Depredation will increase with bear population.

b. Fiscal loss to the property owner, crops and livestock will be transferred to the tax-payer. The cost should not be considered mitigation measures, but just compensation for property takings and damages. The level of the expenses of all impacts must be accounted for in the EIS.

c. The Presidential Executive Order 12630 requires federal agencies to analyze the economic effects or takings implication in proposed policies, decision, rule and regulation on private property and rights. EO 12620 also directs administrative agencies to assess the potential takings of private property under the 5th & 14th Amendments.

d. This area is under the jurisdiction of the police powers of state and local governments. The NCE introduction of grizzly bears has federalism implications that will substantially override the inherent attribute of State governmental sovereignty which is also shared by local governments in Washington State

e. These inholdings ae significant State and federal lands within and adjacent to the NCE recovery area. Introduction of the grizzly bear has huge takings issues with access and use of private forest lands, private property, limitations on recreational and personal freedom to use property or recreate on public lands and may restrict forest management practice and wildfire mitigation. Government decision makers are to carefully evaluate the effect of their administrative, regulatory and legislative action on constitutionally protected property rights. For purposes of this current DEIS any decision to introduce bears into the NCE must be associated with a comprehensive cost benefit analysis addressing all the concerns and items within this table and prior scoping documents.

Correspondence: Comments on Draft Grizzly Bear Restoration Plan/EIS, North Cascades Ecosystem
By the State of Idaho, Governor's Office of Species Conservation
and Idaho Department of Fish and Game
Submitted November 13, 2023

Idaho has invested considerable resources in grizzly bear conservation. Idaho has participated in the Interagency Grizzly Bear Committee (IGBC) and on-the-ground management and monitoring efforts in our state for decades. We do not oppose the principle of restoration of a symbolic grizzly bear population for social and ecological purposes in North Cascades National Park, associated federally designated wilderness, and adjacent British Columbia. We do, however, object to misapplying the 10(j) provisions of the ESA to do so. As indicated by our scoping comments for preparation of the draft EIS, use of the ESA's 10(j) provisions for restoration of a small grizzly bear population in the North Cascades is not appropriate as a matter of law or as a matter of science.

We do not understand why USFWS and NPS ignored our scoping comments and did not consider a reasonable, lawful alternative to an arbitrary ESA 10(j) listing: restoration in North Cascades National Park (or adjacent federally designated wilderness) in coordination with state authorities without ESA-listed status. Grizzly bears are protected as a state endangered species in Washington

It does not help social acceptance for grizzly bears in Idaho to misapply ESA protections and ESA recovery resources to the North Cascades. We incorporate by reference Idaho's delisting petition , which describes why the current lower-48 listed entity for grizzly bear is a non-species and should be delisted.

The alternative for restoration as a 10(j) nonessential experimental population in most of Washington state is a ready illustration of the merits of Idaho's petitioned delisting of the current listed entity. The draft EIS does not clearly identify what ESA "species" being recovered. The draft EIS should clearly identify grizzly bear as subspecies belonging to the brown bear species taxon, neither of which is ESA-listed. ESA protections may only apply to taxonomic species, subspecies and distinct population segments (of vertebrate taxa) that interbreed when mature. See 16 U.S.C. §1532(16). There is not a connection between the 10(j) nonessential experimental population and an entity qualifying as a DPS under the ESA.

The spatial extent of the grizzly bear subspecies is over 55,000 individuals and distributed across a range exceeding 1.7 million square miles, from the Northern Rocky Mountains of the United States through western Canada to Alaska. USFWS' 2016 SSA Framework indicates that resiliency is measured at the population level, representation at the species (biological) and possibly, population level, and redundancy is measured at the species level. The draft EIS muddles this analysis.

The draft EIS does not - and cannot -explain what "distinct population segment" of grizzly bears this 10(j) nonessential

experimental population is supposed to support the recovery of, or under what criteria it will determine that "species" is recovered, or how the entirety of that entity could be delisted in the future. The ESA does not provide a basis for an untethered nonessential experimental population to be subject to perpetual ESA protection. Yet, that is what the 10(j) alternative would do, creating an ESA limbo status for an anticipated 60 to 100 years or more.

USFWS cannot reconcile its 10(j) alternative for a nonessential experimental population for the North Cascades with the structure of the ESA. The ESA is not supposed to provide perpetual federal protection when it is not biologically necessary for continuation of taxonomic (biological) species. USFWS cannot reconcile this proposal with its 1996 DPS policy, which is supposed to further Congress' intent to provide ESA protections to "distinct population segments" "sparingly," and ensure that ESA protections be reserved for populations that are distinct and significant to the taxon (i.e., biological species or subspecies). 61 Fed. Reg. 4,722-5 (1996).

The draft EIS recognizes that from 1990 to 2022 USFWS identified that the North Cascades grizzly bear population was warranted-but-precluded for uplisting to endangered. However, the draft EIS does not appear to recognize that this ESA status could only lawfully apply to the North Cascades if the population were itself a stand-alone DPS (because it is not a taxonomic species or subspecies).

The draft EIS reflects that USFWS considers the North Cascades population to be functionally extirpated (i.e., it is not a population). The draft EIS continues to refer to the geography of the North Cascades in the United States and Canada as distinct and isolated from other grizzly bear populations. USFWS has identified 3 populations within male dispersal distance of the North Cascades restoration area, and those populations are all in British Columbia. This setting indicates that the North Cascades does not align with any other portion of the listed "lower-48" entity to constitute a DPS.

The draft EIS also describes that achievement of a restored isolated population size of 200 grizzly bears in the North Cascades would be "self-sustaining" (see Elements Common to All Action Alternatives). This and similar descriptions of the "3R" benefits of a population of a restored isolated population for the North Cascades is inconsistent with the recovery criteria USFWS has applied to occupied recovery zones, including Greater Yellowstone.

The proposed action and preferred alternative imply at least 60-100 years of ESA protections to support a restoration objective of 200 grizzly bears and a carrying capacity of 200-300 grizzly bears. These population sizes are below the minimum population size of 500 grizzly bears that USFWS has identified for short-term genetic fitness (USFWS 2022 Species Status Assessment, p. 80; see also Franklin 1980) and a self-sustaining population.

USFWS is not applying the same framework to the North Cascades population that it is applying to its requirements for delisting populations like the GYE. The restored North Cascades population of 200 (or even 300) does not attain a size, distribution, ecology, or genetic fitness to meet USFWS' current delisting requirements. Nor does a potentially restored North Cascades population present resiliency, representation, or redundancy significant from the overall perspective of the widely distributed, 55,000+ grizzly bear subspecies, or the more extensive brown bear species (taxon). The restored population size is not one that meets USFWS criteria for independent viability or self-sustainability. For potential delisting of Greater Yellowstone, USFWS has made clear 500 is a minimum population threshold and that population goals must be "well above" this threshold. See USFWS 2022 Species Status Assessment, p. 80; see also the Conservation Strategies for the NCDE and GYE.

Federal attorneys recently told a federal judge in Wyoming that USFWS needed until July 31, 2024 to make a "legally and scientifically sound decision" related to a "12-month" determination that it was required under the ESA to make by January 2023 for the petitioned delisting of Greater Yellowstone grizzly bears. At the same time USFWS seeks to further prolong its review processes before delisting the GYE and NCDE recovery areas, it has speedily prepared and issued a draft EIS that indicates that the GYE and NCDE are appropriate source populations for the restoration. The draft EIS describes the GYE and NCDE as healthy and removal of grizzly bears for relocation to the North Cascades would not affect their population viability. This inconsistency in criteria and approach undermines trust that is essential in conservation efforts that involve interagency cooperation and social tolerance.

At the recent meeting on the North Cascades Subcommittee of the IGBC, USFWS and NPS indicated a driver for accelerated consideration of a 10(j) proposal for the North Cascades is the potential for Canadian Provincial or First Nation authorities to

reintroduce grizzly bears into the small isolated portion of the North Cascades in British Columbia, an area not part of the current grizzly bear listed entity. Even if that were to occur, the 1996 DPS policy does not support providing ESA protections to individual reintroduced grizzly bears straying southward to the United States in the North Cascades; these isolated reintroduced individuals are not part of a distinct population segment sufficiently significant to qualify as species to which ESA protections may apply (See 1996 DPS Policy's explanation of "significance").

It is also inappropriate for the USFWS and NPS to proceed with a preferred alternative that devotes ESA personnel and fiscal resources at the expense of the performance of USFWS' responsibilities in areas that grizzly bears currently occupy in Idaho and adjacent states. In other communications with Idaho concerning USFWS' inability to complete documents, meet monitoring expectations, or support conflict management, USFWS has repeatedly cited limitations on its personnel and fiscal resources.

While Appendix C of the draft EIS provides budget figures and personnel numbers for restoration, it is implausible that USFWS' fiscal and personnel challenges regarding areas that grizzly bears currently occupy will be alleviated by USFWS' undertaking reintroduction of a grizzly bear population into an area that hasn't supported them for decades. A reintroduction into the North Cascades comes with inherent responsibilities for grizzly bear monitoring, conflict management, public safety, and oversight of bear-related infrastructure. USFWS has not explained how it will perform these responsibilities without coming at further expense of the challenges it already faces in currently occupied recovery areas.

Based on the track record of litigation involving grizzly bears, and 10(j) proposals involving grizzly bear and wolves, it is also reasonable to anticipate additional litigation involving both in the 10(j) listing and in the proposed additional allowances for grizzly bear take. We incorporate by reference our December 4, 2022 scoping comments related to a pattern of litigation and administrative decision-making that has limited touted flexibility of 10(j) or 4(d) take regulations in other comparable scenarios.

The following are additional comments on specific topics.

The Proposed NEP geography

The proposed NEP geography does not align with the processes for delineation of conservation areas for other grizzly bear populations to the east (i.e., the Selkirk and the designated experimental population area for the Bitterroot ecosystem). Given our participation in the IGBC and case law related to the need for "remnant analyses" to prevent ESA listed entities from becoming legal orphans, we are especially disappointed with the lack of coordination on this point.

Again, the proper legal framework for consideration of this proposal is through federal and state authorities outside of the ESA, as a delisted restoration experiment.

The draft EIS indicates that "the proposed NEP area includes most of the State of Washington except for an area in northeastern Washington that encompasses the Selkirk Ecosystem Grizzly Bear Recovery Zone." This statement may be misinterpreted that USFWS has identified the Columbia River as the boundary of the Selkirk Recovery Zone. No such determination has been made, and the Selkirk Recovery Zone delineation remains the same in the United States as that identified in the 1993 USFWS Recovery Plan.

Over a year ago, the IGBC directed the Selkirk Cabinet-Yaak Subcommittee to proceed with finalizing a conservation strategy for the Selkirk and Cabinet-Yaak Recovery Areas, including an update of the outdated demographic criteria and completion of federal land habitat criteria. However, these efforts have only recently resumed in earnest, and are still in the initial aspects of discussion.

USFWS and USFS have also recently begun to undertake a separate EIS to consider restoration of grizzly bears in the Bitterroot Recovery Area, and are still pondering the appropriate geography to apply to the analysis. The current Experimental Population Area for the Bitterroot 10(j) rule is defined to the west by US Highway 95 (south to New Meadows and the junction of Idaho state highway 55).

Identification of the scope of the North Cascades NEP was not been coordinated with either the Selkirk/Cabinet-Yaak or the Bitterroot efforts. The delineation of the North Cascades eastern boundary appears to make unsupported assumptions about these other processes.

IDFG would tentatively propose the Pend Oreille River and Highway 95 south to I-90 as the western boundary of a Selkirk/Cabinet-Yaak population area (which includes areas of human development that is generally unsuitable for grizzly bear occupancy). However, IDFG's potential delineation assumes that the area west of the Selkirk is able to be properly delisted and would not be part of any grizzly bear distinct population segment that qualifies as a species under the ESA.

Idaho continues to oppose ESA listing of grizzly bear non-species that consign our citizens to perpetual ESA protections that are not necessary and are unrelated to prevention of endangerment or threat of species extinction.

Proposed Management Zone boundaries

Despite being a proposal involving translocation of 25 bears to reach a restoration objective of 200-300 bears between 60 and 100 years from now, the 10 (j) proposal indicates designation of a wide swath of scattered parcels of national forest system lands as "Management Zone 2" to support future dispersal of grizzly bears

The level of social acceptance of grizzly bear restoration in historical habitat changes based on how issues are approached, bear population density and conflicts, and how much confidence people have in federal, state, and tribal wildlife managers. There is not a biological basis to expand the current level of habitat restriction and programs to areas well outside core restoration areas, especially in the Colville, Okanagan-Wenatchee, and the Gifford Pinchot National Forests. This is especially true for checkerboard ownership and small isolated pockets of national forest system lands that are insufficient for supporting grizzly bear home ranges or any extended occupancy.

Designation of Management Zones (1, 2, and 3), is not used for the GYE population, but is used for the NCDE population. In the NCDE, designation as Management Zone 2 indicates an area of opportunity for movement of grizzly bears between primary conservation (recovery areas). ecosystems. This application of Management Zone 2 does not have a place in the North Cascades restoration. The areas outside of the main North Cascades area would appear to correspond to the NCDE's designation of Management Zone 3 or entirely outside of the grizzly bear management framework. The North Cascades restoration project has not been formulated to connect with the Selkirk Recovery Area or other U.S. populations because of human development in interlying areas, conflict potential, and public safety concerns. Expansive designation of Management Zone 2 would imply a practical override of interlying areas of Management Zone 3, which would not bode well for social acceptance.

While we defer to our sister state of Washington on the particulars, approaches taken by USFWS and federal land management agencies in Washington can significantly affect social acceptance of grizzly bear conservation in Idaho. The extensive delineation of Management Zone 2 for this proposal does not appear grounded in biological needs of grizzly bears, and may be interpreted as an attempt to make de facto land use decisions or restrictions on national forest system lands (e.g., motorized uses, forest products, mineral development, developed recreation). This interpretation would be unlikely to improve and promote social acceptance of expansion of grizzly bear populations in Idaho.

Proposed Management Flexibility Within Management Zones / Proposed measures to prevent and minimize human-grizzly bear conflicts

See our above comments regarding our skepticism, based on experience, that proposed management flexibility will actually be effected, based on litigation outcomes and USFWS administrative implementation.

We note recent literature on actions to address maladaptive culture in grizzly bears. Servheen and Gunther, Conservation and management of the culture of Bears, Ecol. and Evaluation, April 2022.

Potential Adverse Effects to Grizzly Bear Donor Populations

Idaho, Montana, and Wyoming have been interacting with USFWS for over a year on updating the interagency conservation strategy for the Greater Yellowstone population and the related Tri-State Memorandum of Agreement for state management of discretionary mortality to support delisting and post-delisting management.

USFWS has given these documents considerable scrutiny concerning post-delisting management of discretionary mortality, but did not identify potential use of the GYE population as a source population for restoration in the North Cascades.

Transfer out of the GYE population to support reintroduction in the North Cascades would be counted as discretionary mortality for the GYE. For a delisted GYE population, removal of grizzly bears from the GYE (from areas other than the National Parks) to support North Cascades restoration would require host state approval. This removal would count against the donor state's allocation of discretionary mortality, unless other agreement was reached among the states. Translocation

plans that may rely on using grizzly bears from the National Parks should be communicated to states and the public in advance to avoid perception of actual mortality and to promote proper management of other actual mortality that is discretionary.

Biological or ecological requirements of the grizzly bear as related to the proposed NEP area, management zones, or proposed regulations.

As noted above, the delineation of national forest system lands as Management Zone 2 is inconsistent with the framework of North Cascades restoration because of its relative isolation. Delineation of checkerboard and small parcels as Management Zone 2 is also unsound because of grizzly bear home range sizes and other ecological requirements. See USFWS 2022 Species Status Assessment, p. 44 (describing differences in male and female home ranges based on variability in population densities, habitat productivity and other factors).

Scientific Information

The draft EIS does not include current information relative to the GYE population size, etc. following implementation of the integrated population model by the Interagency Grizzly Bear Study Team in 2021.

The draft EIS correctly observes that grizzly bears are opportunistic omnivores that have demonstrated considerable diet plasticity. However, British Columbia populations would seem to provide better analogs for climate and food selection for the North Cascades than the referenced small Cabinet-Yaak geography or the 1999 Jacoby study referenced diet of males in the NCDE and GYE.

The draft EIS does not detail monitoring methods and resources, and these are not uniform in currently occupied populations. It is unclear what agency or agencies will have the responsibility for monitoring the population. The Greater Yellowstone grizzly bear is one of the most studied populations in the world, and involves considerable interagency resources that do not appear to be involved with this proposal. The habitat of the Selkirk/Cabinet-Yaak and NCDE Recovery Areas are less conducive to intensive monitoring because of terrain and forest cover, and monitoring in the Selkirk Cabinet-Yaak has been limited by USFWS personnel resources and apparent pursuit of other priorities. The information presented by the draft EIS seems to minimize the challenges of monitoring grizzly bears. Maintaining radio collars requires recaptures, which are not always successful, and males are prone to "casting" their collars as they gain and lose body fat during the annual cycle.

1986 Interagency Grizzly Bear Committee Guidelines for Nuisance Status (Appendix D)

Agency control actions regarding removal of grizzly bears constituting nuisances are subject to the conditions of 50 CFR 17.40(b). On federal lands (national park system, national forest system and bureau of land management), 1986 Interagency Guidelines apply based on mapped "Management Situation Areas." The "Management Situation Areas" terminology is distinct from the EISs identification of Management Zones 1, 2 and 3. The 1986 Guidelines, as well as documents contemporary with the Guidelines' adoption, indicate they do not apply to non-federal lands. E.g., 51 Fed. Reg. 42,863 et seq. The differential in application of the guidelines to federal and non-federal lands should be made clearer in future discussion.

Bear Management Units

USFWS previously divided the North Cascades Recovery Area into 42 Bear Management Units. BMUs and subunits are used in occupied Recovery areas for habitat and occupancy criteria. However, the body of the draft EIS does not appear to include a map illustrating the BMUs. A BMU map is relegated to appendix E. Of the previously identified 42 BMUs, several have significant portions that are now mapped as Management Zone 3, and at least one unit is mapped entirely as Management Zone 3. Discussion of BMUs appears cursory, so the final EIS should explain to the extent they apply in criteria development.

Conclusion

Social acceptance is key to grizzly bear conservation in Idaho and elsewhere, and a legally and scientifically flawed 10(j) proposal undermines our collective efforts. The people of the Kootenai River Valley and Fremont County currently shoulder costs and consequences from the successful expansion in size and number of grizzly bears in Idaho, including conflicts in residents' actual backyards. The 10(j) alternative implies a 60 to 100-year limbo status under the ESA untethered to any distinct population segment. Our greatest concern is the damage this proposal may have on people and grizzly bears in Idaho, through diversion of USFWS' limited fiscal and personnel resources away from the management challenges of areas already occupied by grizzly bears.

Grizzly bear management in a socially acceptable manner is not a responsibility to be taken lightly. It should also not be undertaken with a philosophy that puts more bears in more places based on a flawed legal framework and thinning of on-the-ground resources for monitoring and management activities.

Endnotes

Correspondence: To the office of the Superintendent,

I am writing about by concerns about bringing the grizzlies back to the west coast. Are you bringing the Native grizzlies which are the brown bear or Kodiak bear?

You brought the Canadian wolfs which are bigger and meaner than the native wolves, now the native wolves have been killed off by the Canadian Wolves. It sounds like another government screw-up.

Yours Respectfully

Correspondence: Dear Mr. Striker,

I am writing to endorse Alternative B of the proposed Grizzly Bear Restoration Plan. And while introducing bears using Alternative C under the 10(j) rule is better than not introducing bears at all, I fear it might end up doing more harm than good, and put undue stress on the bears.

As the daughter of a Nat. Parks Service Ranger, I had the rare privilege of growing up in the Badlands of South Dakota in the 1960's when it was a Nat. Monument. It has since become a national park. In 1963 bison were introduced, and in 1964 so were bighorn sheep. At this time I recall my father talking about black-footed ferrets which were thought to be extinct, but had recently been found and were going to be introduced as well. In all cases, 60 years later, there are sustaining populations of all three species - a true conservation success story.

In closing, I strongly support the introduction of grizzly bears to their historical range and appreciate all of your efforts to make this a reality. As a keystone species, the ecosystem needs them. Thank you for the opportunity to comment.

Sincerely,

Correspondence: I am late sending my views on Grizzly Restoration in the North Cascades, but I still want to contribute my thoughts.
Who was there pt in the North Cascades?? the grizzlies & the indigenous tribes, where both bears and indigenous people respected the land and all its creatures. Indigenous peoples all over the world are/were capable of successfully managing, cherishing & nurturing their environs on this planet.
Introducing the White Man into North America was/is a complete failure as we have invaded, gutted, pillaged, destroyed, abused, infected, trashed, & discounted the value of what the indigenous tribes could teach us.
Bringing grizzly bears back into the North Cascades would be a start to restore the land & wildlife back to its former unspoiled abundance.
Do the right thing!

Correspondence Type: Letter

Correspondence: In response to the introduction of the Grizzly Bear to Washington and The North Cascades 10(j) rule. First of all, I don't agree with the introduction of the grizzly bear to Washington State or the North Cascades for the following reasons.

(1) The grizzly bear was here, and while I can't deny that; It was also hunted and trapped by the early settlers of the region. There was no moratorium on the hunting of bears at that time. As is stated, "They are opportunistic omnivores and display great diet plasticity, even within a population, shifting their diet, according to foods that are most nutritious (i.e., high in fat, protein, and/or carbohydrates) and by availability. They consume almost any food available, including living and dead mammals or fish, insects, worms, plants, human-related foods, garbage, livestock and agricultural crops." The grizzly became easy prey as they came to the farmed land to feed, as there wasn't sufficient food supply in the higher mountains. Therefore, the early settlers could easily remove them, and they did.

(2) Also as stated, "In a diet study of grizzly bears in several western ecosystems, researchers found that adult grizzly bears were more carnivorous than any other age, sex or class, with diets composed of around 70 percent meat (Jacoby et al. 1999, pp. 924-926)." If sufficient game animals are not in their home range, they will devour the livestock in the lower farm lands of the state. They will also venture out of the North Cascades into other populated parts of the state. One remedy would be to introduce large mammals before introducing the grizzly bear and see if the grizzly bear will come back into the North Cascades naturally to feed on them. As the bison were here previously, reintroduce bison into the region first to serve as a food source. This would be less objectional. The grizzly bear were in the Docotas and as the bison were killed off the grizzly bear left.

(3) At the meeting in Omak, one speaker stated that a trapper, who had lived at Domke Lake for 60 years, collected over 300 bear hides, but also stated that he had not known how many were actually grizzly, likely very few, if any, indicating that few or no grizzly were in the Domke Lake region. Also, most of the bears trapped or shot were attracted by bait and garbage left out. This would indicate that the bears would not have been in that region if it weren't for the food made available by the settlers living there. This may be supposition, but without any firm statistics regarding the number of bears that were populating the area prior to the settlers coming, it would appear that humans had actually attracted them to that area.

(4) Depending on the ecosystem and density, the "Average home range size for males varies from 183 to 835 (sq. mi.)" (USFWS 2022, p. 44). A bit nit picky, in my opinion, the average is defined as, $(a + b) / 2$, therefore, $(183 + 835) / 2 = 509$ (sq. mi.). This would mean that the average would be 509 (sq. mi.), or it should have said, and likely what they meant is, the home range size is from 183 to 895 (sq. mi.) not that this is the average range. With a range of up to 895 square miles, this would allow any one bear to wander anywhere in Washington State without introducing them.

(5) Just as a note: The Pacific Crest Trail in WA is only 505.7 miles. Therefore a one mile wide trail from the Columbia River to Canada is less than 509 sq. mi., the average range of an adult male grizzly bear.

Correspondence: I am resubmitting the letter I wrote several years ago on this topic. SW

Reintroducing Grizzlies to the North Cascades National Park is a bad idea. I'm afraid that people have a very idealistic and misguided view of what this would mean to an area well used by humans. Grizzlies are not animated Disney characters or selfie opportunities; they are dangerous wild animals. When encounters between grizzlies and people take place, the consequence for the human is most often dire or deadly.

I lived in Alaska with my family for over two decades. I spent many hours in the wilderness, either trail running or hiking in summers or cross-country skiing during the winter months. While this was exhilarating and wonderful, it was also filled with a tension that just wouldn't go away because of the possibility of a bear encounter. We had to always make sure to have a large enough group so we could

"appear big" to a bear in case of an encounter. It was always important to make enough noise so that we could be heard from some distance so that we didn't surprise a bear. These were not mere groundless fears from paranoid city slickers. During my time in Alaska, two members of a well-known Anchorage family were killed by a grizzly sow who was defending a moose kill. This happened not 5 miles from Anchorage. While we lived there, many more attacks occurred to hikers, runners, and bikers, and since leaving, these attacks have increased in number as more people venture into the wilderness. Some have been deadly, some causing critical injuries to the victim.

Washington state has a far greater human population than Alaska, and numerous people take advantage of outdoor opportunities in our beautiful state. When grizzlies once occupied the North Cascades in great numbers, this was not the case. They roamed freely without us in their way. Bringing in grizzlies I fear would be similar to the mountain goat relocation in the Olympics. What seemed like a nice idea at the time turned deadly for one hiker and terrifying to others as both the goat and human populations increased the number of face to face encounters. Can you picture darting and airlifting grizzlies out of the North Cascades because this decision to repopulate was not thoroughly thought through?

I would strongly suggest studying not just the impact of bears being reintroduced into the North Cascades National Park environment alone, but the impact of bears on people in that same environment. Living along side these predators is no simple matter. I don't believe that most of us are equipped to deal with an attack by this powerful, aggressive animal. Let's make sure that this decision, one way or the other is realistically decided by those who have actual wilderness experience.

Correspondence: I am opposed to transplanting grizzly bears to the North Cascades. Option A. No Action.

I feel that our ranchers and orchards would be at risk. With the fires that occurred in 2015 between Omak and Winthrop there is really no good vegetation for the Grizzly Bears to thrive. I feel that because of that, that they will get very hungry and start looking for things, people, animals, fruit in the orchards, etc. to eat.

I fear people, animals and property will be destroyed and lots of lawsuits will be coming. I feel we should just leave them right where they are.

Correspondence: I oppose the transplanting of the grizzly bears - Alternative A - No Action.

I have personally seen a grizzly bear sow and her cub in the state of Washington. I came across them when I was hunting deer, they had drug a elk about 1/2 mile and was in the lower area feeding on a elk carcass. I backed away and got before being spotted. I felt very endangered.

I own 72 acres of Douglas fir and Ponderosa pine in Okanogan County and I'm out working, thinning trees at least 5 days a week. We already have at least two wolves that I know of and mountain lions. I do not want to have to carry a 44 magnum and continuously look over my shoulder while working!! To me this seems like more of the environmentalist plot. If you go up in the National Forest between Omak and Winthrop you can see what the environmentalist has created. Because of the logging operations and tree thinning being shut down by the environmentalist group. They were the main cause of the 2015 forest fire. With that being said, there is no longer any vegetation left for the bears to thrive. It has taken 8 years for the trees to come back naturally and it will take 100 years to completely be restored.

Correspondence: RE: Grizzly bear Restoration plan comments

Dear Superintendent,

Thank you for allowing myself and others to offer comments regarding the grizzly bear restoration plan. I am in favor of Alternative C, but with the following comments:

Loomis State Forest

1) The Loomis State Forest has been designated as Zone 3, though this 134,000 acre forest adjoins the Pasayten Wilderness (Zone 1), Okanogan National Forest (Zone 1), and the Canadian Border and that country's Snowy Mountain Protected Area. Instead, the Loomis State Forest should be either Zone 1

(preferred) or Zone 2 at the least. There is no change of habitat quality when going from the adjoining areas (Zone 1) in the Pasayten Wilderness and Okanogan NF to the Loomis State Forest. Both public lands are located in the same ecosystem and have no hard borders between them.

2) Since the North Cascades Grizzly Bear Recovery Area was formed, the Loomis State Forest has been has fallen under this designation. The Loomis State Forest has 3 designated areas to maintain either its road less character and natural processes (NRCA) or botanical treasures (Chopaka NAP). These 2 designations total around 30,000 acres and are situated in the highest elevations of the Loomis State Forest.

The NRCAs were created when the 1998 Loomis State Forest management plan violated the grizzly bear recovery area guidelines. Because of the management plan violations to the grizzly bear recovery area, a lawsuit was settled that allowed the citizens of Washington State to raise over 18 million dollars to remove 25,000 acres from trust management and into the protected NRCA status.

To move the Loomis State Forest from a possible Zone 1 or 2 designation to Zone 3 seems to be a violation of what the citizens of Washington State wanted when they raised the money to protect these areas.

3) If best science is to be applied to restore the grizzly bear to the N. Cascades Ecosystem, the Loomis State Forest should be in Zone 1, at worst Zone 2. There is plenty of habitat for the bears to utilize, just as there is on the adjoining Zone 1 lands.

Loup Loup State Forest

The Loup Loup State Forest should also be either in Zone 1 or Zone 2, not as designated in the preferred alternative as Zone 3. This 30,000+ state forest adjoins the Okanogan NF Zone 1. It makes no scientific sense to have a public forest go from Zone 1 on adjoining lands to a Zone 3, also on public lands.

Colockum Wildlife Area

The Colockum Wildlife Area should also be included in either Zone 1 or Zone 2. This 88,000+ acre WDFW managed area

ranges from about 600' to over 6800' in elevation and would make great dispersal habitat. This Washington State wildlife area adjoins Zone 1 (Okanogan/Wenatchee NF) and so should either also be designated as Zone 1 or Zone 2, if science is the driver for the restoration of grizzly bears in the N. Cascades.

By the way, I lived for over 20 years in an inholding in the Loomis State Forest. I would sincerely like to see the grizzly bear restored to its rightful place in the Loomis State Forest and adjoining public lands.

Thanks for accepting my comments.

Thank you for allowing me to comment on the EIS, North Cascades Ecosystem regarding grizzly bears. Please make my comment part of the official record of the EIS.

NO! PLEASE DO NOT BRING GRIZZLY BEARS FROM ELSEWHERE INTO THE NORTH CASCADES NATIONAL PARK!

If one really looks at the bigger picture of environmental health of wilderness over the long term, the "reintroduction" of grizzly bears into the North Cascades is downright silly. Bringing back an organism that is at the top of the food chain adds positively to biodiversity and to important dispersal of botanical species? I am certain that is not true. I am certain that the protection of thousands of other species NOT at the top of the food chain is far more important.

I have personally observed a small (maybe 350 pounds) grizzly spend less than five minutes digging for its lunch (a rodent.) In those few minutes that grizzly did more damage to a half acre of the landscape than a bull dozer could do in twice that much time. As a human visitor to the wilderness, if I had done such damage to the natural landscape, I would have been fined, jailed and held financially accountable for restoration of the landscape. Grizzlies, artificially brought in, would not be a friendly addition to our current North Cascades landscapes.

In addition to landscape concerns, grizzly/human conflict is a huge issue to be considered. One of the most pleasant activities I have personally enjoyed over my lifetime is traveling alone in our beautiful wilderness. One cannot safely hike or climb alone in wilderness where there are grizzly bears. Artificially bringing in these bears seems to me unfair to future generations of human wilderness users in this and many other ways.

More than once, my friends and I have planned climbing trips into the Selkirks in Canada only to be told we could not go to the specific area planned due to ongoing grizzly problems. Grizzly bears in wilderness are increasingly preventing safe recreation for people, or at least that is the case for me and my friends who enjoy back country hiking and climbing.

If grizzlies are reintroduced artificially, ie, by means other than by natural re-migration, human/grizzly conflict will become an increasingly dangerous and expensive nightmare for the National Park Service, for the U.S. Fish & Wildlife Service, for numerous Washington State agencies, local agencies, and especially for those of us citizens who enjoy recreation in the wilderness.

Please consider the thousands of PCT through hikers. None of them want all that added weight of bear spray, bear canisters, etc. In addition, I think we can guarantee that if grizzlies are artificially brought to the North Cascades, there will be days that

people are not even allowed into certain areas at all because of the bear risks.

Also, please consider the EXPENSE of both Alternative B and Alternative C. Consider the cost of the procedure of capturing, collaring, and transporting these bears. Consider the cost of ongoing management. Consider the cost of additional personnel for both planning and management. Consider that we currently have a huge federal deficit, and there just isn't money available for such a questionable plan as this.

No doubt, if grizzlies are brought into the North Cascades artificially, there will be an occasional human fatality. I realize that we humans are not on the endangered species list, but is it really worth it? I say "NO!"

PLEASE, AS REGARDS THE EIS, THE ONLY SENSIBLE CHOICE IS ALTERNATIVE A (NO ACTION)

PLEASE DO NOT TRANSPORT GRIZZLY BEARS FROM ELSEWHERE INTO THE NORTH CASCADES.

Dear Don:

This note amounts to one of those that either gets done now or it dies on the vine.

You and I had a brief visit during a break in the meeting in Darrington last Thursday. I'm the old guy who recalled not shooting a grizzly in Alaska long ago. You summarized a somewhat similar personal experience involving a worn .. Not sure it's important to establish that connection but I'd like to share a small take away from that gathering ..

A youngish woman made what I think were some important points. She was perhaps No. 15 in the lineup of speakers, athletic, mountaineer, white water shredder, animal owner perhaps a Darrington area resident.. She pointed out a truism: Outdoor activity amounts to accepting some measure of danger. I think she mentioned specifically the possibility of catastrophic falls. It would be easy to add to that list, drowning, hypothermia, etc etc .. I'm 86yo, pushing 87 pretty hard. Driving home in the dark, only about 45 miles, I began to think what the hell I'm likely in greater danger of serious injury here inside the vehicle than I would be hiking in Denali!!

I checked your bio online briefly so that now I'm satisfied you're well acquainted with statistics .. Folks in Darrington and likely elsewhere trotted out horror stories of grizzly attacks. For the sake of avoiding dissent let's assume they are all true .. But what about less dramatic causes of serious injury or fatalities like attacks or injuries caused by pet dogs or even livestock like horses. Going on: how about road rage, personal affronts these days involving gun fire, for God's sake mass shootings hardly get more than a day or two notice in the press .. Now back to statistics: how about attacks by grizzlies ranked by some reference to a per capita basis maybe related to user days in wilderness inhabited by grizzlies. I'm not smart enough to know how to do that but you may be or likely you'd have plenty of resources to help with something like that.. Hmmm, it might rank almost up there with getting struck by lightning!!

Moving on, I doubt thumping the tub for more beavers will get much traction. Maybe just a brief distraction while it's put aside, but those critters were surely part of the landscape when salmon and grizzlies were dominant members of the ecosystem. But enough of that ..

In a recent note from Brenda Cunningham she mentioned that she was glad you and I had met .. I count Brenda and Tim as good friends ..

Exit laughing, or at least smiling,
Fred Hodge

OKTOBER 21, 2023

GRIZZLEY RESTORATION EIS

810 STATE ROUTE 20

SEDRO-WOOLLEY, WASHINGTON 98284"

To members of the public comments committee:

ABSTRACT

Stable populations of grizzlies exist in British Columbia, Idaho and Montana. Allowing members of those groups to reclaim suitable territory in the north cascades without human intervention, is preferable to capturing them and reintroducing them artificially.

Funds from all sources, including those targeted for grizzly bear rehabilitation, should be used to study the use of beavers to enhance biodiversity by damming streams to slow runoff in the face of vanishing glaciers.

INTRODUCTION/DISCUSSION

These are a layman's perspective based on recollections and experience beginning with an elk hunt with John Craighead and Maurice Homaker in the west fork of the Bitterroot River in 1958. John Craighead had just begun landmark grizzly bear studies in Yellowstone Park. The endangered species act has since provided state and federal agencies funding making possible the steady growth of grizzly populations in "the lower 48" including the noble goal of reintroduction of grizzly bears into the north cascades ecosystem. My first encounter with a grizzly occurred north of Gulkana in the Copper River area of Alaska sixty three years ago. Working in Alaska sporadically since then I've had several more encounters with grizzlies and brown bears .. People accustomed to working in those areas don't take them for granted, they understand grizzlies can be very dangerous, and or deadly. Nowadays accounts of attacks are commonplace. Whether or not they are lethal they invariably lead to destruction of the off ending bear.. Government involvement in reintroducing grizzlies incurs some degree of responsibility/liability, thus the hue and cry following an attack will likely be accompanied by litigation as well as sustained public criticism.

Nature abhors a vacuum. That implies grizzlies from slowly growing populations neaby will drift back into the north cascades when or if their numbers begin to exceed the carrying capacity of their present range. Allowing grizzlies to return to the north cascades naturally would give wilderness users sufficient time to become accustomed to their presence. Advocates of capture/release claim it would take too long for grizzlies to reclaim the north cascades though their estimates of population growth using capture/release methods would take roughly 100 years to reach optimal levels. So., why not try bait .. Rapidly vanishing glaciers due to global warming means less water during drier hotter summer months. Why not advocate for more beavers. Articles documenting the presence of grizzlies in the north cascades appear to be largely anecdotal, such as referring to Hudson's Bay Trading Company records of grizzly bear skins. Early Hudson's Bay records contain accounts of brigades of trappers sent to catch as many beavers as possible to satisfy a demand for expensive hats and to simultaneously, discourage immigration by making the Pacific Northwest "a beaver desert" .. Paleological evidence would document extensive beaver populations in the cascades. Beavers are drivers of biodiversity, they are natural engineers damming streams slowing down runoff but terrain surrounding dams ponds will ultimately contain a diverse array of flora and fauna that amount, among other things, to naturally occurring bait for omnivorous bears. That scenario is far from counter intuitive in the face of the benefits of pushing increases in beavers and wolves in Yellowstone Park. There's no doubt more beavers in the north cascades would enhance biodiversity to the betterment of the ecosystem as well as to all of its inhabitants .. Sincerely, [REDACTED]

Superintendent's Office
North Cascades National Park Service Complex
810 State Route 20
Sedro-Wooley, WA 98284

Dear Superintendent's Office:

Why would we want to put the lives of men, woman, children, livestock and other animals in danger of being maimed, mauled or killed by a grizzly bear? Grizzly bears are unable to live (very long) on ants, nuts or berries. They are carnivorous animals who eat live flesh and blood from a chipmunk to a moose, plus you and me.

Grizzly bears are not endangered so why say that? Where was Kia Relyea born and raised to become an authority on grizzly bears? We know that the Hollywood elite give big bucks to animal rights and environment groups so I guess by throwing out the names of [REDACTED] we should be all in? I don't think the Hollywood elite will be back packing, hunting or fishing the North Cascades of Washington.

It has cost our state and many others millions of dollars to restore the wolves, for what? We cannot afford to fix our roads and bridges or fully fund education and you want to spend millions on a bear. Think about it.

Several outfitters have been put out of business from the wolves killing off game animals in the states and the grizzly bear would only add to this. Bears will attract and kill every moose, elk and deer that is giving birth they can find. These animals will be unable to run or defend themselves at this vulnerable time. You never see these scenes shown on television. You realize there are approximately 20 grizzly bears in the North Cascades now, so instead of playing God why don't you let them take care of their own restoration. I am sure they are not all of one sex. I was born in 1940 and raised in Toledo, Washington. I have ridden my horse, hiked, hunted, fished, and camped the high Cascades all my life. Mostly the St. Helens, Goat Rocks and Pasayten areas. I have seen all kinds of animals and I hope it stays that way. These animals do not need to be at risk of being eaten by grizzly bears. God help the person that gets between a grizzly bear sow and her cubs. Think about it.

I would like to hear back from you. Will there be any public meetings held on this matter? If so, when and where?

Why do you insist on trying to kill something or someone?

I take time to put pen to paper to voice by opposition to any grizzly restoration to Washington State.

My wife in younger years with 3 kids trailing or on her back use to hike every trail off the I-90 corridor up to the pass. I could only envision an "incident" with current hiking mothers + kids happening with grizzly bears.

An excellent book "Taken by Bear in Yellowstone", Kathleen Snow, 2016 would qualify my concerns about introducing + protecting such a massive predator.

As a former hunter who has hunted in different states, I say again "NO" to grizzly introductions in this state.

Thank you

NOCA Grizzly Bear EIS

It is best to follow the existing management plan and encourage the grizzly bears from BC to migrate down across the border to the NOCA ecosystem. The NOCA Wilderness Committee with the Resource Management division created and embraced a strategy to manage NOCA as grizzly habitat back in the 1990's. It worked for wolves; it should work for the bears.

The proposal to introduce grizzly bears, a different gene pool, from the Rockies has unrealistic expectations. It is a strange NPS priority for funding in the face of our climate challenge issues. It is an inappropriate financial commitment for NOCA given the seriously inadequate base funding and subsequent staff vacancies. NOCA cannot handle the additional workload with the massive responsibilities and commitment of this new initiative. All other divisions will be drug into the grizzly bear program needing to support the planned operation and, when things go wrong. No division operates in a vacuum.

Park staff should be focusing on the overflowing trail head issues with the subsequent safety situation along Hwy 20. It appears the use at NOCA has skyrocketed since the pandemic. NOCA needs financial support from WASO and Congress to address this growth and keep our visitors safe.

The estimates for helicopter use are woefully low. Nothing could be worse for the NOCA wilderness and the grizzly bears than helicopters. Does this 1 million dollar per year program for ten years have an estimated carbon footprint to share with us all? A clean energy shuttle bus program up and down Hwy 20 would be more appropriate. From Marblemount to Winthroppe stopping at every trailhead and campground.

The NPS once had visions of leading the nation in the climate change challenge.

What happened to that priority?

Regards,

██████████

November 2023:

I have spoken against the draft EIS in Darrington earlier this month.

This short comment is to state that I am also opposed to the Proposed Rule 1 OG):

I see that it is an attempt to provide more assurance to hikers and residents of the Skagit Valley/North Cascades. However, in order for it to come into effect, something either troublesome or very bad, would have to happen FIRST! In addition, it is not always easy to tell WHICH bear caused the problem, and it might take a series of negative events for authorities to identify and take action on the correct bear.

Leave our mountains and valley as they are!

Robert Claus: Comment on Draft EIS: Page 1

I am opposed to the introduction of grizzly bears into the North Cascades, either experimentally or otherwise. We have had

two families of children in Alaska since 2010, and visit often.

Every trail we walk on has warning signs about bears and how to react if you are attacked. We always carry bear spray and are scared anytime we hike there. Education is not enough. Grizzlies are unpredictable and can appear quickly. You can carry bear spray in your hand, but can you keep your young children from bouncing ahead of you on the trail??

Our daughter was widowed by an Eagle River grizzly attack in 2018. In the same town, she is friends with a couple whose only child daughter was killed in 2017 when she ran out of bear spray as the bear returned repeatedly.

Since 2010:

* On the Army base in Anchorage, where our daughter had been stationed, a female hiker has been mauled, and a soldier on maneuvers was killed very recently, both by grizzlies.

* A 12 year old in Anchorage, waiting for the school bus by his mailbox was attacked by a sow grizzly and survived.

* A man near by in Hope who was clearing brush on his land was killed by grizzly several years ago.

* A 13-14 year old boy taking part in a sponsored race through forested or bushy areas in Anchorage, texted a bear was following him, but the black bear killed him before help could come.

Our daughter frequently hikes on the south fork of Eagle River trail directly across from her house. So do I, but it always scares me. This summer, our daughter's female friend was charged by a grizzly twice, low down on that trail not too far from the parking lot, with houses right across the paved road.. She had bear spray and a cell phone, retreated a bit higher up out of the trees, and the park managed to rescue her by helicopter.

These bear are dangerous and won't stay up high in federal lands. They will come down lower, where food is more plentiful. If we are supposed to enjoy seeing them, where will that be? Surely not begging for treats along Hwy 20 while we are in our car. Maybe in Marblemount near our chicken coop? Otherwise, it is going to be on a trail, far away from everyone, and from help. Right now our trails are safe. Let's leave them that way.

Correspondence: Comment on the proposed 10(j) rule:

I am just as opposed to the reintroduction of the grizzly as an non-essential experimental population as I am, to the Draft EIS method of introduction.

I do not support the proposed 10(j) rule.

For a bear to be established as problematic, and various corrective measures to be taken, it would have to be clearly identified, and an undesirable event or even tragedy would have already occurred.

Correspondence: I vote for Alternative A-NO CHANGE.

Washington State citizens have already voiced in, and their elected Senators and Representatives have codified RCW 77.12.035, " Grizzly bears SHALL NOT be transported into the state The department is directed to fully participate in discussions and negotiations with federal and state agencies, and shall fully communicate, support and implement the policies of this section."

Of the statistics available, in the past 15 years, 183 attacks, 21 of them fatal. Word has it that it takes between seconds, and a few minutes for a grizzly bear to kill a human. Grizzlies are known to grow 3 to 4 ft. on all 4's, but 8 ft standing up,

and would terrorize most people who are enjoying the outdoors, camping, walking.

Most of these attacks have occurred in the Yellowstone, Glacier National Park, area of Montana, where the vast majority of grizzly bears are located, and Feds, enviro's, tribes, think they need to be relocated to WA and other designated places, RZ, or "relocation zones", such as Frank Church River of No Return Wilderness, Idaho, due to overcrowding. Sort of a "do no harm" solution.

WE DO NOT WANT THEM!

Grizzly bears are very aggressive, when overcrowded, where they are currently located. The way proposed of "managing" the population, is to move them to become some other state's "problem".

The grizzly bear cannot be fenced in, nor controlled where it roams, into neighborhoods, eating people's pets, killing livestock, or any other farm animal, and endangering those citizens who live in any rural area. Even Spokane WA had a black bear roaming in an inner city area residential neighborhood, last week.

The Indian tribes say these bears are an important part of their culture, yet the bear's biggest diet is SALMON, which the tribe also wants us to remove our dams to protect the salmon. The grizzly is one of only a handful of species that have no predators. They are omnivores (meat eating), and prey on other animals, including salmon, bison, elk, deer, moose, and humans, for most of their diet.

If these Grizzlies are increasing in numbers, so rapidly, that they need to be controlled, they need to be DELISTED, from the ESA list, and have them harvested, as was the intent of the ESA (or so it was stated), when a species recovered, through naturally increased recovery. In 2016, comments were taken to delist these bears, in Yellowstone but this did not happen, even though MT, ID & WY, signed off on that.

Thank you for considering my comments. Please keep your bears in your own backyard.

Correspondence: Washington State has a law that stipulates, "Grizzly bears shall not be transplanted or introduced into the state. Only grizzly bears that are native to Washington state may be utilized by the department for management programs" I don't believe that the U.S. Constitution enumerated powers to transport or install grizzly bears into Washington state, therefore, state law prevails. This is a "states rights issue".

Because Washington D.C., is not a state, The Federal Government does have the right to add Grizzly bears to any "District of Columbia" park that you see fit. Please let us know how that goes, and we can discuss it further.

I am strongly against any plan to relocate grizzly bears into Washington State. This is not the first time that this plan has been brought before the public for comment. How many times must you bring this forward?

Thank you,
